The Design/Build Entity shall indemnify, defend and hold harmless the City and its respective officers, elective and appointive Board, employees and consultants (including the Project Manager and Architect of Record), from all suits, actions or claims brought for, or on account of injuries or damages received or sustained by any person or persons, by or from the Design/Build Entity, the Design/Build Entity's employees or agents, in construction of the Work, or by or in consequence of the Design/Build Entity's failure to properly guard the same, or by or as a result of any act or omission of the Design/Build Entity, the Design/Build Entity's employees or agents.

In addition to any remedy authorized by law, moneys due the Design/Build Entity under the Design/Build Agreement, as considered necessary by the City, may be retained until disposition has been made of such suits, actions, or claims for damages; however, this provision shall not be construed as precluding the City from enforcing any right of offset the City may have to any such moneys. These obligations shall apply to any claim or action asserted by a private party or by a governmental agency, including, but not limited to, any claim or action for multiple or punitive damages; and these obligations are intended to apply with respect to claims arising during the term of this Agreement or following any expiration or other termination of this Agreement, and shall survive the expiration or other termination of this Agreement.

- .2 The Design/Build Entity's obligations as described above shall apply regardless of fault or negligence (whether active or passive) on its part or on the part of the indemnified parties to the extent allowed by law; it being the intent of this Agreement that these obligations be interpreted in the broadest possible manner provided that, as to any indemnified party, said obligations shall not apply to injury, death, or damage to property to the extent arising from the negligence or the willful misconduct of said indemnified party or its officers, agents, servants, or independent contractors who are directly responsible to the indemnified party, or for defects of design furnished by such persons but provided further that the foregoing limitations shall not apply to the extent reimbursable through any insurance required by this Agreement.
- .3 These obligations of the Design/Build Entity shall not be construed to negate, abridge, or otherwise reduce any right of indemnity or any other rights to which the City would otherwise be entitled

12.2.2 The Design/Build Entity shall cause all subcontracts to include the indemnification and hold harmless requirements set forth in this Article, in a form satisfactory to the City.

## 12.3 No Personal Liability.

No officer, elective and appointive Board member, employee, or consultant of the City will be personally responsible for liabilities arising under this Design/Build Agreement.

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

## 12.4 Performance Bond and Payment Bonds.

- 12.4.1 The Design/Build Entity shall furnish to the City, prior to the awarding of any contract, a surety bond in favor of the City in the amount of not less than 100% of the amount of Contract, to guarantee faithful performance of Contract and a payment bond, each in the form attached to the Design/Build Agreement. Bond shall guarantee repair or replacement of deficient, defective or faulty materials and workmanship for a period of one year following completion of the project unless otherwise required in the Contract Documents. The Bond shall be issued by an California admitted surety with a rating classification of "A XIII" or better according to Best's Rating Service.
- 12.4.2 The City acknowledges that any faithful performance and payments bonds provided by the Design/Build Entity shall not apply to errors or omissions in the furnishing of professional services in connection with architecture or engineering services provided by the Design/Build Entity or its consultants. The City waives and releases all claims against such sureties arising out of or relating to such professional errors and omissions; such release, however, does not apply to a failure to provide professional services where required under the Contract, and the performance bonds shall include the costs of such services. Professional Liability insurance shall be primary insurance in settling claims related to Errors and Omissions

## ARTICLE 13 – SEPARATE CONTRACTS

### 13.1 City's Right to Perform Construction and to Award Separate Contracts.

- 13.1.1 The City reserves the right to perform work or operations related to the Project with the City's own work force, and to award separate contracts in connection with other portions of the Work or other construction or operations on the Work.
- 13.1.2 When separate contracts are awarded for different portions of the Work or for other construction or operations on the Project site, the term "Contractor" in the Contract Documents in each case shall mean the contractor who executes each separate agreement.
- 13.1.3 The City will provide for coordination of the activities of the City's own work force and of each separate Contractor with the work of the Design/Build Entity, who shall cooperate with them. The Design/Build Entity shall participate with other separate Contractors and the City in reviewing and revising their Baseline Schedules when directed by the City. The resulting Baseline Schedules shall then constitute the schedules to be used by the Design/Build Entity, separate Contractors and the City.
- 13.1.4 The City reserves the right to perform other work in connection with the Project or adjacent to the Project site by separate contract or otherwise. The Design/Build Entity shall at all times conduct the Work so as to impose no hardship on the City or others engaged in the

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

Work, nor to cause any unreasonable delay or hindrance to the Work.

## 13.2 Mutual Responsibility.

13.2.1 The Design/Build Entity shall afford the City and other Contractors the opportunity for introduction and storage of their materials and equipment and performance of their activities, and shall connect and coordinate the contractors construction and operations with theirs as required by the Contract Documents.

13.2.2 If part of the Design/Build Entity's work relies on proper execution or results upon construction or operations by the City or a separate Contractors, then the Design/Build Entity shall, prior to proceeding with that portion of the work, report to the City apparent discrepancies or defects in other construction that would render it unsuitable for proper execution and results. Failure of the Design/Build Entity to report any discrepancies or defects shall constitute an acknowledgment that the City's or separate Contractors' complete or partially completed construction is fit and proper to receive the Design/Build Entity's work.

13.2.3 The Design/Build Entity shall promptly remedy damage wrongfully caused by the Design/Build Entity to any completed or partially completed construction or to any property of the City or separate Contractors.

13.2.4 The City and each separate Contractor shall have the same responsibilities for cutting and patching as are described in Paragraph 3.7, Cutting and Patching.

## ARTICLE 14 – MISCELLANEOUS

### 14.1 Governing Law

The parties have executed and delivered this contract in the City, County of San Luis Obispo, State of California. This Design/Build Agreement shall be governed by the laws of the State of California. The exclusive venue for any action or proceeding, in law or equity that may be brought in connection with this contract, is the Superior Court of the State of California in and for the County of San Luis Obispo, or the United States District Court, Central District, California.

### 14.2 Successors.

The City and the Design/Build Entity respectively bind themselves, their partners, shareholders, successors, assigns and legal representatives to the other party and to shareholders, successors, assigns and legal representatives of such other party in respect to covenants, agreements and obligations contained in the Contract Documents. Neither party shall assign the Design/Build Agreement as a whole without the written consent of the other party. If either party attempts to make such an assignment without such

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

consent, that party shall nevertheless remain legally responsible for all of its obligations under the Design/Build Agreement and the Contract Documents.

## 14.3 Notice.

Written notices or other communications required or permitted hereunder shall be sufficiently given if delivered personally, by facsimile, by registered or certified first class U.S. mail, return receipt requested with postage pre-paid, or by commercial courier. Written notice shall be deemed to have been duly served in the date of delivery if delivered in person or by facsimile, on the first working day after deposit if delivery by overnight courier, or two working days after deposit of delivery by placing in the U.S. mail as provided herein. All notices shall be addressed to the appropriate Authorized Representative, as follows:

Design/Build Entity:

\_\_\_\_\_  
\_\_\_\_\_

City

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

## 14.4 Statutory Limitations.

Commencement of statutory limitation periods and statute of repose periods shall be as follows:

14.4.1 As to acts or failures to act occurring prior to Final Completion, any applicable statute of limitations shall commence to run and any alleged cause of action shall be deemed to have accrued in any and all events not later than such date of Final Completion.

14.4.2 As to acts or failures to act occurring after the date of Final Completion, any applicable statute of limitations shall commence to run and any alleged cause of action shall be deemed to have accrued in any and all events not later than the date of any act or failure to act by the Design/Build Entity pursuant to any applicable warranty, the date of any correction of Work or failure to correct Work by the Design/Build Entity, or the date of actual commission of any other act or failure to perform any duty or obligation by the Design/Build Entity or the City, whichever occurs last.

14.4.3 The time period for the applicable Statute of Repose shall commence to run at Final Completion of the Work.

## 14.5 Modifications.

No modifications or Change Orders shall be valid unless in writing and

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

signed by the City and the Design/Build Entity or their respective permitted successors and assigns. The Design/Build Entity and the City agree to make modifications to this Design/Build Agreement if requested by the City's lender(s), provided that such modifications do not adversely affect the costs and/or risks and/or time of performance of the Work.

### **14.6 Meaning of Words.**

Any and all headings used in this Design/Build Agreement are for convenience only and do not modify, define or limit the provisions of it. Words of any gender shall be deemed and construed to include correlative words of the other gender. Words importing the singular number shall include all supplements and/or amendments to any such exhibits or documents entered into in accordance with the terms of this Agreement. All references to any person or entity shall be deemed to include any person or entity succeeding to the rights, duties and obligations of such person or entity in accordance with the terms of this Design/Build Agreement. Where reference is made in this Design/Build Agreement to another Contract Document, the reference refers to that provision as amended or supplemented by the other provisions of the Contract Documents.

### **14.7 Severability.**

If any provision of this Design/Build Agreement is held to be inoperative or unenforceable as applied in any particular case because it conflicts with any other provision hereof or any constitution, statute, ordinance, rule of law or public policy, or for any other reason, then such holding shall not have the effect of rendering any other provision contained herein to be inoperative or unenforceable to any extent whatsoever. The invalidity of any one or more phrases, sentences, clauses or sections contained in this Design/Build Agreement shall not affect the remaining portions of this Design/Build Agreement or any part of it, and they shall otherwise remain in full force and effect.

### **14.8 Whole Agreement.**

This Design/Build Agreement and any and all exhibits, the Design/Build Entity's Proposal, which is incorporated by reference, and the Contract Documents shall constitute the entire agreement between the Parties, related to the subject matter hereof. No inducements, considerations, promises or other references shall be implied in this Design/Build Agreement that are not expressly addressed in this Agreement. By incorporating the Design/Build Entity's Proposal as part of this Design/Build Agreement, the City does not accept any provision of the Proposal that are not in conformance with the criteria of the Request for Proposal.

### **14.9 Record Retention and Audits.**

The Design/Build Entity agrees that the awarding department or their designated representative shall have the right to review and to copy any records and supporting documentation pertaining to the performance of this

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

Agreement. The Design/Build Entity shall keep full and detailed accounts and exercise such controls as may be necessary for proper financial management under this Design/Build Agreement; the accounting and control systems shall be reasonably satisfactory to the City and shall be in accordance with generally accepted accounting standards.

Design/Build Entity shall retain all records, books, correspondence, instructions, drawings, receipts, subcontracts, vouchers, memoranda and other data relating to this Design/Build Agreement for a period of five years after Final Payment under this Agreement, or for such longer period as may be required by law. Design/Build Entity agrees to allow the City auditor(s) access to such records during normal business hours and to allow interviews of any employees who might reasonably have information related to such records, and not withhold relevant information. Further, Design/Build Entity agrees to include a similar right of the City to audit records and interview staff in any subcontract related to performance of this Agreement.

### 14.10 Deliverables.

The Design/Build Entity is responsible for delivery to the City certain drawings, schedules, reports, samples and other documents as described in the Contract Documents.

### 14.11 Waiver.

No waiver of any condition, requirement or right expressed in this Agreement shall result from any forbearance of the City to declare a default.

### 14.12 Brokerage or Contingent Fees.

Design/Build Entity warrants by execution of this Agreement, that no person or selling agency has been employed or retained to solicit or secure this Agreement upon understanding or agreement for a commission, percentage, brokerage or contingent fee, excepting bona fide employees or established commercial or selling agencies maintained by Design/Build Entity for the purpose of securing business. For breach or violation of this warranty, the City shall, in addition to other remedies provided by law, have the right to terminate this Agreement without liability, paying only for the work actually performed, or otherwise recover the full amount of such commission, brokerage or contingent fee.

### 14.13 Computer Software.

Design/Build Entity certifies it has appropriate systems and controls in place to ensure City funds will not be used in the performance of this Agreement for the acquisition, operation or maintenance of computer software in violation of copyright laws.

### 14.14 Independent Capacity.

Design/Build Entity, and agents and employees of Design/Build Entity, in the performance of the agreement, shall act in an independent capacity and

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

not as officers or employees or agents of the City.

### 14.15 Air or Water Pollution Violations.

By signing this agreement, the Design/Build Entity swears, under penalty of perjury, that the Design/Build Entity is not: (1) in violation of any order or resolution not subject to review promulgated by the State Air Resources Board or an air pollution control district; (2) subject to a cease and desist order not subject to review issued pursuant to Section 13301 of the Water Code for violation of waste discharge requirements or discharge prohibitions; or (3) finally determined to be in violation of provisions of federal law relating to air or water pollution.

### 14.16 No Uncertainty Protection.

This Agreement is the product of negotiation and compromise on the part of both Parties and that the Parties agree that, notwithstanding Civil Code section 1654, any uncertainty in this Agreement shall not be construed against the drafter.

### 14.17 PWCR Number.

Deign/Build Entity, in the space provided on the signature page shall provide Deign/Build Entity's public works registration (PWCR) number for City to complete the PWC 100 Form.

### 14.18 Effective Date.

The effective date of this Agreement is the date it is signed on behalf of City provided it has also been signed on behalf of Design/Build Entity.

## EXHIBIT C – DESIGN/BUILD ENTITY’S GUARANTY OF OBLIGATIONS

GUARANTY OF OBLIGATIONS OF DESIGN/BUILD ENTITY UNDER THE \_\_\_\_\_ DESIGN-BUILD PROJECT DESIGN/BUILD AGREEMENT

THIS GUARANTY (“Guaranty”) is made and entered into as of \_\_\_\_\_, 20\_\_\_\_, by \_\_\_\_\_ (“Guarantor”) to and for the benefit of the CITY OF \_\_\_\_\_ (“City”) with reference to the following facts:

- A. \_\_\_\_\_ (“Design/Build Entity”), is about to enter into a certain Design/Build Agreement (the “Agreement”) with the City, and a number of related Contract Documents (as that term is defined in the Agreement) where under the Design/Build Entity is to design and build a Water Reclamation Facility Design-Build Project in \_\_\_\_\_, CA.
- B. For a variety of reasons the Design/Build Entity is a newly formed entity whose sole shareholders are \_\_\_\_\_ (the “Contractor”) and \_\_\_\_\_ (the Architect). Because the City must be assured that the Design/Build Entity has the financial strength and expertise to carry out its obligations under this Agreement, it has required, as a condition of entering into the Agreement, that the Contractor execute this Guaranty where under the Contractor, as Guarantor hereunder, guarantees to the City that it will guaranty the performance of all obligations of the Design/Build Entity under the Agreement, whether physical or financial, all as more particularly herein stated.
- C. All terms used in this Guaranty which are not defined shall have the meanings assigned in the Agreement, the Contract Documents, the Construction meanings assigned in the Agreement, the Contract Documents, the construction documents, and any other documents referred to in the Agreement. For purposes of this Guaranty, the term “Collective Agreements” shall refer to the Agreement, the Contract Documents, the construction documents and any other documents referred to in the Agreement, in the aggregate.

NOW THEREFORE, for a valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the Guarantor, for itself, its successors and assigns:

1. Unconditionally and absolutely guarantees the due and punctual performance of any and all obligations of the Design/Build Entity under the Collective Agreements, and each of them, in accordance with the terms thereof, whether such be obligations to act, or make payments of any nature whatsoever, whether now or hereafter due, as well as the due and punctual performance and observance by Design/Build Entity of all the other terms, covenants, and conditions of the Collective Agreements, and each of them (including, without limitation, the completion of the construction of the Project contemplated by it in accordance with the terms of it and including the payment of all funds required in excess of the City’s commitment to pay for the construction), together with all attorney fees, court costs, and other costs and expenses as shall be paid or incurred by the City in connection with the attempted enforcement of the Collective Agreements, or any of them, or portions thereof, or paid or incurred by the City in connection with the

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

defense by the City of any action, suite, or claim by any third party with respect to any of same, or paid or incurred by the City in connection with the attempted enforcement of this Guaranty. All debts, duties, liabilities, and obligations above described and covered by this Guaranty or intended so to be, are collectively called the "Obligations."

2. Waives diligence, presentment, protest, notice of dishonor, demand for payment, extension of time of payment, notice of acceptance of this Guaranty, nonpayment at maturity, and indulgences and notices of every kind, and consents to any and all forbearances and extensions of the time of payment or performance by the Design/Build Entity under the Collective Agreements, or any of them, and to any and all changes in the terms, covenants and conditions made or granted and to any and all substitutions, exchanges, or releases of any collateral therefore; also waives any right to cause a marshaling of Design/Build Entity's assets or to cause the City to proceed against the Design/Build Entity before proceeding against the Guarantor; also waives any right to require the Department to apply upon any obligation of the Design/Build Entity under the Collective Agreements, or any of them, guaranteed any funds or other property at any time received by or paid to or in the possession of the City; it being the intention that the Guarantor shall remain liable until the terms, covenants, and conditions of the collective Agreements, and all of them, have been fully performed and observed by the Design/Build Entity, notwithstanding any act, omission, or thing that might otherwise operate as a legal or equitable discharge of Guarantor. In connection therewith, the Guarantor expressly waives any and all benefits, which might otherwise be available to the Guarantor under California Civil Code Sections 2810, 2819, 2825, 2845, 2849, 2850, 2899 and 3443.
3. Agrees that the liability of the Guarantor shall not in anywise be released, diminished, impaired, reduced, or affected by:
  - a. The taking or accepting by the City of any security or guaranty for the Design/Build Entity's performance of any or all of the Obligations;
  - b. Any release, withdrawal, surrender, exchange, substitution, subordination, or loss of any security or other guaranty at any time existing in connection with any or all of the Obligations; any partial release of the liability of any other guarantor or guarantors of any nature whatsoever, or under any other instrument had, or to be had, in connection with, or as security for, the Obligations, or the death, corporate dissolution, insolvency, bankruptcy, disability, or lack of City of the Design/Build Entity, the Guarantor, or any other guarantor or any party at any time liable for the payment of all or any part of the Obligations, whether now existing or hereafter occurring;
  - c. Any renewal, extension, modification, and/or rearrangement of the performance or payment of any or all of the Obligations, or the performance of any covenant contained in any instrument had, or to be had, in connection with, or as security for, the Obligations, either with or without notice to, or consent of, the Guarantor or any adjustment, indulgence, forbearance, or compromise that may be granted or given by the City to any party; or
  - d. Any neglect, delay, omission, failure, or refusal of the City to take or prosecute any action for the collection or performance of any of the Obligations or to

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

foreclosure or take or prosecute any action in connection with any lien, right, or security existing or to exist in connection with, or as security of, any of the Obligations; or to take any action hereunder; it being the intention hereof that the Guarantor shall remain liable as principal until the full amount of the Obligations, together with interest, and any other sums due or to become due upon or in connection with any of the same, shall have been fully paid, performed, and observed by the Design/Build Entity.

4. Agrees that it shall have no right of subrogation whatsoever with respect to the aforesaid Obligations, or to any moneys due and unpaid thereon or any collateral security for the same (unless and until any third party, or the City, as the case may be, shall have received payment in full of all sums at any time due under the Collective Agreements, or any of them.) All sums, amounts, performances owing, or to be performed by Design/Build Entity to the Guarantor, as well as all rights, liens, claims, and securities existing and to exist in connection with it, or as security for it, are declared, recognized, and made subordinate to the Obligations and to all rights, titles, interest, and claims of any nature which the Department may have, or under the Collective Agreements, or any of them, of any nature whatsoever.
5. Agrees that this Guaranty may be enforced by the City without first resorting to or exhausting any particular security, Bond, or collateral for the Obligations, or without first having recourse to the assets or estate of the Design/Build Entity or of any other party liable for the performance of the Obligations, or any of them.
6. Further covenants, represents, and warrants that:
  - a. The Collective Agreements, and each of them, were duly authorized and, to the degree required were, executed by the Design/Build Entity and are legal, valid, and binding instruments, enforceable against Design/Build Entity in accordance with their respective terms.
  - b. Guarantor agrees that in the event this Guaranty is placed in the hands of attorneys for enforcement, the Guarantor will reimburse the City for all expenses incurred, including, but not limited to, attorney fees and court costs, as well as all fees incurred for expert witnesses, consultants, witnesses and the like, whether prior to trial, at trial, or on appeal.
7. Agrees that this Guaranty shall inure to the benefit of the City and its successors and assigns and shall be binding upon and enforceable against the Guarantor and its successors and assigns. The laws of the State of California shall be applicable to this Guaranty.
8. Agrees that if any term, covenant, or condition of this Guaranty, the Collective Agreements, or any of them, or the application to any person or circumstances shall, to any extent, be invalid or unenforceable, the remainder of this Guaranty, the Collective Agreements, and each of them, or the application of such term, covenant, or condition to persons or circumstance other than those as to which it is held invalid or unenforceable, shall not be affected thereby and each term, covenant, or condition of this Guaranty, the Collective Agreements, and each of them, shall be valid and be enforced to the fullest extent permitted by law.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

9. Agrees that in the event of any bankruptcy, reorganization, winding up, or similar proceeding with respect to the Design/Build Entity, no limitation of the Design/Build Entity's liability under the Collective Agreements, or any of them, that may now or hereafter be imposed by any federal, state, or other statute, law, regulation, or judicial or administrative determination applicable to such proceedings shall in any way limit the obligation of the Guarantor, which obligation is coextensive with the Design/Build Entity's liability as set forth in the Collective Agreements, and each of them, without regard to any such limitation. In the event any payment by the Design/Build Entity to the City is held to constitute a preference under the bankruptcy laws, or if for any other reason the Department is required to refund such payment or pay the amount thereof to any other party, such payment by the City to Design/Build Entity shall not constitute a release of the Guarantor from any liability hereunder, by the Guarantor agrees to pay such amount to the City upon demands.
10. Agrees that this Guaranty shall be continuing and of full force and effect until the Obligations under the Collective Agreements, and each of them, are fully paid or performed, as the case may be.
11. Agrees that any notice or demand to the Guarantor may be given and shall conclusively be deemed and considered to have been given and received upon the deposit thereof, in writing, in the U.S. mail, duly stamped and addressed to the Guarantor at the last known address of the Design/Build Entity; but actual notice, however given or received, shall always be effective. The last preceding sentence shall not be construed in any way to affect or impair any waiver of notice or demand provided or to require giving of notice or demand to or upon the Guarantor in any situation or for any reason.
12. In any action initiated by the City to enforce this Guaranty against the Guarantor, except as otherwise expressly agreed, the Guarantor shall be entitled to assert, and rely upon, as against the City any contractual defense(s) under the Collective Agreements and common law to which the Design/Build Entity would be entitled thereunder.

The Guarantor has executed this instrument, the day and year first above written,  
\_\_\_\_\_, California.

## EXHIBIT D – PAYMENT & PERFORMANCE BONDS

SEE FOLLOWING PAGES FOR PAYMENT & PERFORMANCE BONDS

### PERFORMANCE BOND

KNOW ALL MEN BY THESE PRESENTS, \_\_\_\_\_ (hereinafter called the “Principal”) as Principal and , \_\_\_\_\_ a corporation organized and existing under the laws of the State of California (hereinafter called the Surety”), as Surety, are held and firmly bound to CITY OF MORRO BAY (hereinafter called the “City”), as Obligee, in the sum of \_\_\_\_\_ Million Dollars, for the payment of which sum well and truly be made, the said Principal and Surety bind themselves, and their respective heirs, subcontractors, contractors, successors and assigns, jointly and severally, thereby by these presents.

WHEREAS, (I) the Design/Build Entity has entered into a Design/Build Agreement (hereinafter called the “D-B Agreement”) with the City for the design and construction of the Morro Bay Water Reclamation Facility Design-Build Project (hereinafter called the “Project”); and

WHEREAS, the Principal has submitted a bid for the work on the Project.

NOW THEREFORE, THE CONDITION OF THE OBLIGATION IS SUCH, that if the Principal shall well and truly perform all of the undertakings, covenants, terms, conditions and agreements of the Contract Documents within the time provided therein and any extensions thereof that may be granted by the Authority, as applicable, and during the life of any guaranty or warranty required under the Contract Documents and shall also well and truly perform all of the undertakings, covenants, terms conditions and agreements of any and all duly authorized modifications of the Contract Documents that may be made, and shall indemnify and save harmless the obligee of and from any and all loss, damage, and expense, including costs and attorney’s fees, from which the said obligee may sustain by reason of failure to do so, then this obligation shall be null and void; otherwise it shall remain if full force and effect.

The said Surety agrees that no change, extension of time, alterations, additions, omissions or other modifications of the terms of the Contract Documents or in the work to be performed with respect to the Project, or in the specifications of plans, or by any change or modification of any terms or payment or extension of any time for any payment pertaining or relating to the Contract Documents, or by rescission or attempted rescission of the Contract Documents, or this Bond, or by any condition precedent or subsequent in this Bond attempting to limit the right of recovery of obligee otherwise entitled to recover under this Bond, or by any fraud practiced by any person other than the obligee seeking to recover on this Bond, shall in anywise affect its obligation on this Bond, and it does hereby waive notice of any such changes, extensions of time, alterations, additions, omissions or other modifications. The Surety agrees that to the extent that payment of sums pursuant to the Contract Documents undertaken by the Surety, and the payment obligation could be construed as an obligation under this Bond or the payment bond issued by the Surety contemporaneously with the issuance of the Bond, such payment shall be treated solely as the discharge of an obligation under the payment bond and shall not reduce or impact on the Surety’s obligations under this Bond.

When this Bond has been furnished to comply with a statutory or other legal requirement in the location where the construction is to be performed, any provision in this Bond conflicting with said statutory or legal requirement shall be deemed deleted herefrom and provisions conforming to such statutory or other legal requirement shall be deemed incorporated herein. The intent is that

**DRAFT DOCUMENT - NOT A PUBLIC RECORD**

this Bond shall be construed as a statutory bond and not as a common law bond.

IN WITNESS WHEREOF, the above bounded parties have executed this instrument under their several seals this \_\_\_\_ day of \_\_\_\_\_, 20\_\_\_\_, the names and corporate seals of the corporate parties being hereto affixed and those presents duly signed by their undersigned representatives, pursuant to authority of their governing bodies.

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

## PAYMENT BOND

KNOW ALL MEN BY THESE PRESENTS:

THAT WHEREAS, the City (herein after called the "City") has awarded a Design/Build Agreement (hereinafter called the "D-B Agreement") to \_\_\_\_\_, the Design/Build Entity (hereinafter called the "Design/Build Entity") for the design and construction of the City Design-Build Project (hereinafter called the "Project"); and

WHEREAS, the Design/Build Entity is required to furnish a payment bond in connection the Contract Documents, to secure the payment of claims of Design/Build Entity laborers, mechanics, material men and other persons as provided by law.

NOW THEREFORE, we the undersigned Principal (Design/Build Entity) and Surety are held and firmly bound unto the Authority obligee in the sum of \_\_\_\_\_ Million Dollars (\$ \_\_\_\_\_ ) for which payment well and truly to be made we bind ourselves our heirs, executors and administrators, successors and assigns, jointly and severally firmly by these presents.

THE CONDITION OF THIS OBLIGATION IS SUCH that if the Principal, or its heirs, executors, administrators, successors or assigns or subcontractors, shall fail to pay any of the persons named in California Civil Code Section 3181, or amounts due under the Unemployment Insurance Code with respect to work or labor performed by any such claimant, or any amounts required to be deducted, withheld and paid over the California Franchise Tax Board from the wages of employees of the Principal and/or its subcontractors pursuant to Section 18306 of the California Revenue and Taxation Code, with respect to such work and labor, then the surety or sureties will pay such amounts in an amount not to exceed the sum specified in this bond, otherwise the above obligation shall be void. In case suit is brought upon this bond, the surety will pay a reasonable attorney's fees to be fixed by the court.

This bond shall inure to the benefit of any of the persons named in California Civil Code Section 3181 as to give a right of action to such persons or their assigns in any suit brought upon this bond.

Notwithstanding the number of claimants on this bond or any underlying law to the contrary, the Sureties shall not be liable under this bond for an amount greater than the aggregate penal sum designated above.

The said Surety agrees that no change, extension of time, alterations, additions, omissions or other modifications of the terms of the Contract Documents, or in the work to be performed with respect to the Project, or in the specifications or plans, or by any change or modification of any terms of payment or extension of the time for any payment pertaining or relating to the Contract Documents, or by any recession or attempted recession of the Contract Documents, or this Bond, or by any conditions precedent or subsequent in this Bond attempting to limit the right of recover of claimants otherwise entitled to recover under this Bond, or any fraud practiced by any person other than the claimant seeking to recover on this Bond, shall in any way affect its obligations on this Bond, and it does waive notice of any such changes, extensions of time, alterations, additions, omissions or other modifications.

When this Bond had been furnished to comply with a statutory or other legal requirement in the location where the construction is to be performed, any provision in this Bond conflicting with

**DRAFT DOCUMENT - NOT A PUBLIC RECORD**

said statutory or legal requirement shall be deemed deleted here from and provisions conforming to such statutory or other legal requirement shall deemed incorporated in it. The intent is that this Bond shall be construed as a statutory bond and not a common law bond.

IN WITNESS WHEREOF, the above bounded parties have executed this instrument under their several seals this \_\_\_\_\_ day of \_\_\_\_\_, 20\_\_\_\_\_, the names and corporate seals of the corporate parties being affixed and those presents duly signed by their undersigned representatives, pursuant to authority of their governing bodies.

**Structural Drawings:**

Plans that indicate the location, type of member, size, and material of each structural element for foundations, floors, roofs, and any intermediate levels. List assumed safe bearing pressures on soils and ultimate strengths of concrete.

Schedules (beam, column, and slab)

Details of all connections, assemblies, expansion joints, and similar items

Structural framing systems for piping, nonstructural elements and fixed equipment

**Plumbing Drawings:**

Floor plans showing complete process and domestic plumbing systems with the following information:

- Location sizes, elevations of water, firewater, sewers, drains, waste, waste vents, and process piping with risers and connections to equipment, drains, and fixtures.
- Locations of meters, valves, cleanouts, etc.
- Fire-extinguishing equipment such as sprinklers and standpipes.
- Location and sizes of natural gas, compressed air, process air piping.
- Single line process diagram for all process piping
- Equipment Schedules

**HVAC Drawings:**

Mechanical floorplans showing complete HVAC systems including

- Air Conditioning systems including refrigerators, water and refrigerant piping, and duct work
- Odor Control and Exhaust ventilation systems showing duct sizes, duct locations, condensate, equipment connections and discharge locations
- Detailed floor plans and sections for all mechanical rooms and equipment
- Air balance schedule indicating the CFM of outside air, supply air, return air, odor control air, and exhaust for all air systems
- Elevations of mechanical equipment to ensure airflows and access to component parts
- Equipment mounting details
- Isometric diagrams of HVAC water systems
- Sequence of operations diagram
- Equipment Schedules

**Electrical Drawings:**

- Transformers and connections
- Feeder and conduit sizes
- Light fixtures, receptacles, switches, and power outlets
- Telephone outlets, conduits, terminal cabinets, and backboards
- Complete fire alarm system including inter connections to SCADA
- Equipment local control panels
- Emergency electrical power system including generator, transfer switches, fuel tanks, and all auxiliaries
- Electrical Details including all mounting details
- Equipment Schedules

**Instrumentation and Controls Drawings:**

- Instrumentation Remote I/O cabinet details
- Controls Details
- Equipment Schedules

Price Proposal Form for  
Design-Build Services of the  
City of Morro Bay  
WATER RECLAMATION FACILITY (WRF) ONSITE IMPROVEMENTS

TO THE PUBLIC WORKS DIRECTOR

COST PROPOSAL

Having carefully examined the Request for Proposal, attachments and related documents the undersigned proposes and agrees to provide to the City of Morro Bay, in accordance with the Performance Criteria Report annexed hereto and made a part thereof, the following materials and labor not to exceed the following guaranteed maximum price at the rates attached hereto (attach all parts and labor rate list):

**BASE BID AMOUNT**

| Item | Qty      | Description                                                           | GMP Total Cost |
|------|----------|-----------------------------------------------------------------------|----------------|
| 1    | Lump Sum | Design-Build of onsite improvements at the Water Reclamation Facility | \$             |
| 2    | Lump Sum | Allowance for Unanticipated EIR Mitigation Measures*                  | \$1,000,000    |

\*This is an allowance for all unanticipated work associated with EIR Mitigation Measure implementation. It has been determined to be \$1,000,000.

TOTAL COST PLUS WITH GUARANTEED NOT TO EXCEED OF BASE AMOUNT:

\$ \_\_\_\_\_

**ADD ALTERNATE:**

| Item | Qty      | Description                                                                               | GMP Total Cost |
|------|----------|-------------------------------------------------------------------------------------------|----------------|
| 3    | Lump Sum | Demolition of existing WWTP per Section 11 of "Attachment A" to the Request for Proposals | \$             |

TOTAL COST PLUS WITH GUARANTEED NOT TO EXCEED OF BASE PLUS ADD ALTERNATE AMOUNT:

\$ \_\_\_\_\_

The price proposals set forth herein shall include any and all applicable taxes. The City reserves the right to reject any and all proposals. The City may make a single award for either the base cost proposal with or without the add alternate. To be considered complete the cost proposal must include the tables on pages 1 through 4 of this of this document. Provide additional pages as required to submit a complete cost proposal.

Life-Cycle Cost Analysis

The Offeror shall provide a present worth life cycle cost for the proposed project. The purpose of the Life-Cycle Cost Analysis (LCCA) is to provide a standardized basis to compare overall costs of proposed project alternatives. The LCCA shall be based on a 30-year life assuming an average flow rate 0.97 MGD, electrical power costs of \$0.12/kwh, natural gas costs of \$0.10/therm, and an annual inflation rate of 2%. The LCCA shall include initial cost, energy costs, operation (not including operator time), maintenance (not including operator time), repair costs, replacement costs, and chemical costs. The LCCA shall include the replacement frequencies, replacement cost, and escalation cost for consumables (i.e. Membranes, odor control media...). The table below is intended to provide a template for the Offeror to develop the LCCA.

| Equipment/<br>System                             | Initial<br>Cost | Replacement | Energy Cost |     |              | Chemical<br>Cost |     |              | Operation &<br>Maintenance<br>& Repair<br>Cost | Total |
|--------------------------------------------------|-----------------|-------------|-------------|-----|--------------|------------------|-----|--------------|------------------------------------------------|-------|
|                                                  |                 |             | Type        | Qty | Cost/<br>Qty | Type             | Qty | Cost/<br>Qty |                                                |       |
|                                                  |                 |             |             |     |              |                  |     |              |                                                |       |
|                                                  |                 |             |             |     |              |                  |     |              |                                                |       |
|                                                  |                 |             |             |     |              |                  |     |              |                                                |       |
| Project 30-year Life-Cycle Total Present Value = |                 |             |             |     |              |                  |     |              |                                                |       |

The Offeror shall also prepare a detailed table of operator manhours required to perform all typical staff operations activities at the WRF, including a breakdown of maintenance, operation, and repair hours per activity for a typical week, month, year, and over the 30-year LCCA period. This should include routine activities as well as those that are less frequent (such as membrane clean-in-place cycles, reverse osmosis clean-in-place cycles, diffuser replacement, pump seal replacement, for example). Include frequency and costs for replacement items such as but not limited to MBR membranes, RO membranes, and fine bubble diffusers. Include any cost escalation factors used in calculations.

In addition to the life-cycle costs above the Offeror shall prepare a 5-year total energy cost, 5-year maintenance cost, and 5-year replacement cost for the entire project based on startup flows and loads for the WRF, assuming 1% annual flow and load increases.

| Description             | Manhours | Consumables/Energy | Totals |
|-------------------------|----------|--------------------|--------|
| 5-Year Energy Cost      |          |                    |        |
| 5-Year Maintenance Cost |          |                    |        |
| 5-Year Replacement Cost |          |                    |        |

PROPOSAL FORM 1

INFLUENT (COARSE) SCREENING  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Influent (Coarse) Screening System. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to manufacturers and models, screen size, dewatering/conveyance type system and layout, construction materials, number of units and capacities per unit, and control features.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for Influent (Coarse) Screening are provided in Section 2.2 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Influent (Coarse) Screening design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 2

GRIT REMOVAL  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Grit Removal systems. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to manufacturers and models, construction materials, number of units and capacities per unit, and control features. The DBE should provide information specific to its proposed design to provide the required minimum performance.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for Grit Removal are provided in Section 2.3 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Grit Removal design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 3

FLOW EQUALIZATION BASIN  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Flow Equalization Basin. Include system descriptions, operations descriptions, and specific information for the equipment proposed. The DBE should provide information specific to its proposed design to accommodate peak flow conditions, including a flow analysis with proposed design flows and configuration for the Flow Equalization Basin. The DBE should provide information regarding the materials of construction, pumps (including number, type, and capacities), mixing system type, equipment manufacturers, odor control provisions, and operational flexibility.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; and capacities. The design criteria for Flow Equalization Basin are provided in Section 2.4 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Flow Equalization Basin designs. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 4

FINE SCREENING  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Fine Screening systems. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to manufacturers and models, construction materials, screen size, number of units and capacities per unit, and control features.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for Fine Screening are provided in Section 2.5 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Fine Screening design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 5

MEMBRANE BIOREACTOR  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Membrane Bioreactor (MBR) system. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to system configuration, manufacturers and models for main pieces of equipment, construction materials, DDW approval for pathogen reduction, design flows, number of units and capacities per unit, design return and waste rates, water quality performance, ancillary equipment, and control features.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for the MBR are provided in Section 2.6 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed MBR design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

Proposed Alternative Treatment Concepts to the MBR system shall provide references for a minimum of three successful full-scale facilities operating in California.

System Description

Operations Description

PROPOSAL FORM 6

AEROBIC SLUDGE DIGESTER  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Aerobic Sludge Digester system. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to materials of construction, volume, aeration system manufacturers and models, and design flow. The DBE should provide information specific to its proposed design to accommodate potential future odor control.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for the Aerobic Sludge Digester are provided in Section 2.7 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Aerobic Sludge Digester design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 7

SLUDGE DEWATERING  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Sludge Dewatering system. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to equipment manufacturers and models, chemicals required including quantity per day/year; number of units and capacity per unit, operating schedule, solids loading rate, and equipment performance.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for the Sludge Dewatering are provided in Section 2.8 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Sludge Dewatering design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 8

REVERSE OSMOSIS  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Reverse Osmosis system. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to system configuration, manufacturers and models for main pieces of equipment, construction materials, design flows, number of skids and capacities per skid (including number of membrane elements per skid), design flux and recovery, frequency and type of cleaning operations including time required for cleaning, chemicals required for cleaning and operation, water quality performance, ancillary equipment, and control features.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for the Reverse Osmosis System are provided in Section 2.9 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Reverse Osmosis System design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 9

ULTRAVIOLET ADVANCED OXIDATION PROCESS  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Ultraviolet Advanced Oxidation Process (UVAOP) system. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to system configuration, manufacturers and models for main pieces of equipment, construction materials, design flows, number of units and capacities per unit, oxidant type and dosages, water quality performance, ancillary equipment, and control features.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for the UVAOP are provided in Section 2.10 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed UVAOP design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 10

CHEMICAL STORAGE AND FEED FACILITIES  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Chemical Storage and Feed Facilities. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to number, type, and materials for storage tank(s); storage area size; feed pump types, models, manufacturers, capacities, and appurtenances; piping materials; and alarms and controls.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; and capacities. The design criteria for Chemical Storage and Feed Facilities are provided in Section 2.11 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Chemical Storage and Feed Facilities design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 11

ODOR CONTROL SYSTEM  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Odor Control System. Include system descriptions, operations descriptions, and specific information for the equipment proposed. The DBE should provide information specific to its proposed design, including but not limited to odorous air treatment type, treatment performance, required chemicals, energy usage, odorous air collection systems and performance.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; manufacturers; and capacities. The design criteria for the Odor Control System are provided in Section 2.12 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Odor Control System design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 12

EFFLUENT PUMP STATION  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Effluent Pump Station. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to pump station capacity, configuration, number of pumps and redundancy, pump manufacturers and materials; and controls.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; and capacities. The design criteria for Effluent Pump Station are provided in Section 2.13 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Effluent Pump Station designs. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 13

RECYCLED WATER STORAGE TANK AND PUMP STATION  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the Recycled Water Storage Tank and Pump Station. Include system descriptions, operations descriptions, and specific information for the equipment proposed. The DBE should provide information specific to its proposed design, including but not limited to tank volume, materials of construction, and design standards; pump station capacity, configuration, number of pumps and redundancy, pump manufacturers, and materials; and controls.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; and capacities. The design criteria for Recycled Water Storage Tank and Pump Station are provided in Sections 2.14 and 2.15 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed Recycled Water Storage Tank and Pump Station designs. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

System Description

Operations Description

PROPOSAL FORM 14

ON-SITE RECLAIMED WATER SYSTEM  
(DESIGN CRITERIA PER SECTION 2 OF THE PCR)

Provide a description of the On-Site Reclaimed Water System. Include system descriptions, operations descriptions, and specific information for the equipment proposed, including but not limited to pump station capacity, configuration, number of pumps and redundancy, pump manufacturers and materials; on-site reclaimed water distribution system design; location of hose bibs; storage design; and controls.

The Performance Criteria Report provides all pertinent design information including, but not limited to: design criteria; mechanical, electrical and I&C requirements; and capacities. The design criteria for On-Site Reclaimed Water System are provided in Section 2.16 of the PCR. The DBE shall review the PCR and provide a statement confirming the requirement of the PCR as being consistent with the design approach utilized for the development of its proposed On-Site Reclaimed Water System design. Should the DBE's proposed design utilize criteria which varies from that identified in the PCR, the Proposer shall describe the variation and provide justification herein.

PROPOSAL FOR THE CITY OF MORRO BAY DESIGN-BUILD SERVICES OF THE

# WATER RECLAMATION FACILITY ONSITE IMPROVEMENTS

---

FILANC BLACK & VEATCH, A JOINT VENTURE

May 8, 2018

City of Morro Bay Public Works Department  
Attn: Rob Livick, Public Works Director  
595 Shasta Avenue  
Morro Bay, CA 93442

**RE: City of Morro Bay Water Reclamation Facility - Onsite Improvements  
Proposal for Design-Build Services**

Dear Mr. Livick,

The enclosed proposal is the culmination weeks of collaboration between dozens of talented design and construction professionals to find the best value solution to the City of Morro Bay's wastewater treatment needs. The technical solution we developed is as innovative as it is effective, affordably addressing the challenging peak flow conditions the City experiences while delivering a state-of-the-art advanced water treatment facility for everyday operations.

In developing our best-value solution for the City, we leveraged every aspect of our industry-leading experience. Our team brings both cutting edge global and local wastewater recycle experience by combining the strengths of J.R. Filanc Construction Company's (Filanc) 65 years of California construction experience with Black & Veatch's global and local wastewater and recycle experience. Our team is also strongly connected the local area, assisting Morro Bay, Paso Robles and Cayucos meet their wastewater and water reuse goals and objectives.

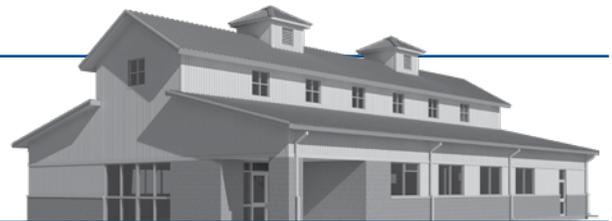

Since the submittal of our qualifying Statement of Qualifications, we have made minor changes to our project delivery team to add differentiating resources. These changes are reflected on our organizational chart shown as Figure 1.1 in Section 1 of this proposal. These changes/additions include:

- **Jorj Long** is replacing Commissioning Manager Mike Heaton, who is retiring. Jorj holds a Grade V Operator's license and worked on the start-up, testing, training, and turnover for the Silicon Valley AWPF. She also worked on several major projects for Orange County Sanitation District. Ron Wade, the recently-retired OSCD Chief Plant Operator declared that "Commissioning and training activities led by Jorj were the best I have ever experienced."
- **Jennifer Enson, PE**, will serve as our Design Quality Manager. She has managed design and procurement on projects totaling more than \$1 billion in construction over the last 10 years. She has more than 20 years of experience in the planning, study, design, and construction of water, recycled water, and wastewater facilities. She recently managed the design of the Northeast Bakersfield Design-Build WTP, a 20-mgd membrane filtration plant for the California Water Services Company.
- **Debbie Burris, P.E., BCEE** has been added to our team so that we can leverage her 23 years of California permitting experience. She was responsible for many sections of the City of San Diego North City Pure Water Project Title 22 Engineering Report. She also provided Design Review, Permitting, Regulatory Compliance including Title 22 Engineering Reports and Supplements for the Groundwater Replenishment System for OCSD and OCWD in Fountain Valley.
- **Dr. Michael Welch**, replacing John Hollenbeck, has been added to our team to support our permitting efforts with the California Regional Water Quality Control. He has 40 years of experience implementing California water projects and has assisted public agencies in evaluating regulatory compliance with state and federal water quality regulations, state and federal drinking water regulations, and state public health regulations. Dr. Welch previously served as an associate engineer with the CRWQB in San Diego.

The Filanc Black & Veatch team, partially illustrated below, looks forward to the opportunity to further dig into the details of this project and work as the City's trusted partner to develop a solution that meets your goals and serves your community for many years to come.

# CITY OF MORRO BAY

**FILANC BLACK & VEATCH CEO/PRESIDENT**  
**Harry Cosmos**

**QUALITY ASSURANCE/QUALITY CONTROL**  
**Richard Kaulen - Safety**  
**Jennifer Enson, P.E. - Design Quality**  
**Tory B Wagoner, P.E. - Construction Quality**

**DESIGN-BUILD PROJECT MANAGER**  
**Gary Silverman, P.E., BCEE, DBIA**

**DESIGN  
MANAGER**  
**Erick Bevington, P.E.**

**PRECONSTRUCTION  
MANAGER**  
**Omar Rodea, P.E., DBIA**

**CONSTRUCTION  
MANAGER**  
**Chad Brown, P.E., DBIA**

**COMMISSIONING  
MANAGER**  
**Jorj Long, EIT**

## KEY MEMBERS OF DELIVERY TEAM

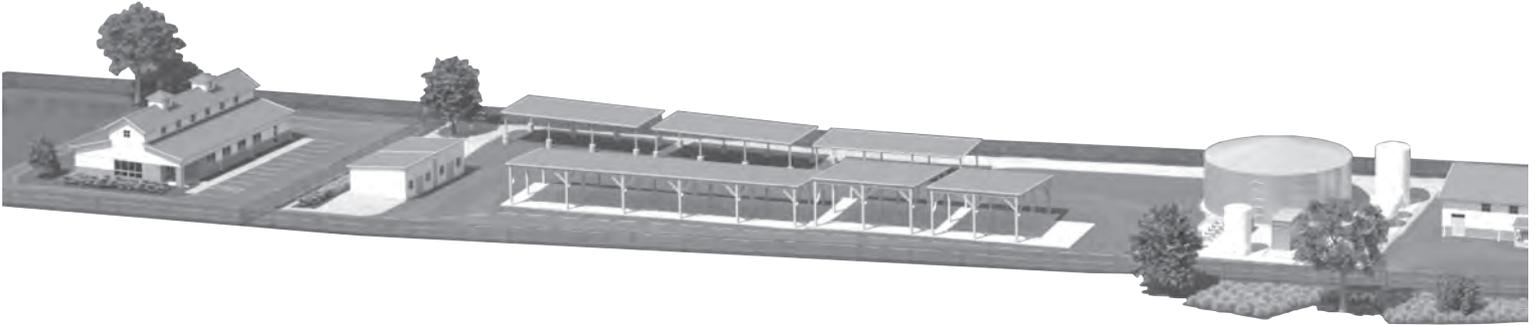

**PROCESS**

**PROCESS MECHANICAL**  
 Kaitie Zusy, P.E.

**PERMITTING**  
 Debbie Burris, P.E., BCEE, D.WRE  
 Michael Welch, Ph.D., P.E.

Very truly yours,

Harry Cosmos, Project Executive  
 Filanc Black & Veatch Joint Venture

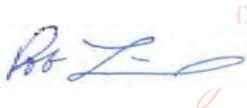

# SIGNED ADDENDUMS

If any equipment warranty failure causes a temporary inability to meet performance guarantees, but the effluent water quality specifications have been maintained, then the Performance and Operational Testing period will not be extended. If any performance guarantee is not met and one or more modifications to any equipment or its operations are necessary to meet the performance standard, then the City has option to extend or restart the Performance and Operational Testing period until after satisfactory completion of the modifications.

Clarifications:

- 1. WRF Access Road:** Improvements to the roadway at the intersection of Highway 1 and South Bay Boulevard are included in the design and construction for the project access road (Performance Criteria Report Figure 5-1). The City will apply for and obtain an encroachment permit from the District 5 Caltrans Encroachment Permit Office for the 19-foot widening and intersection improvement. DB will provide the design support, including drawings, for the permit application. The improvements shall meet Department of Transportation intersection design standards and highway design requirements. DB is responsible for providing information associated with an encroachment exception for this work. Work in the State Highway right of way is expected to be constructed using Department of Transportation/Caltrans Standard Plans and Specifications (most current) and Encroachment Permit Provisions. The encroachment permit application may be downloaded from the following website:  
<http://dot.ca.gov/dist05/permit/index.htm>
- 2. Under what terms will an addendum be issued in response to an Alternative Technology or Management Concepts (ATCs) submitted for review?:** Refer to the Section 2.3.4 of the Request for Proposals, which states: *“If the Owner accepts an Alternative Concept that is contrary to the Performance Criteria Report, the Owner shall issue an Addendum to this RFP altering that portion of the RFP that is inconsistent with the accepted alternative concept.”*
- 3. Site Visits to the Existing WWTP:** Each Proposer may make up to two visits to the existing WWTP. Contact the City’s Utilities Director, Joe Mueller, directly to arrange the visit at [jmueller@morrobayca.gov](mailto:jmueller@morrobayca.gov).

The permit for the WRF will include recycled water requirements. The minimum requirements are as defined by CCR Title 22, Division 4, Chapter 3 Water Recycling Criteria, as applicable for Indirect Potable Reuse: Groundwater Replenishment – Subsurface Application (injection wells). DB shall be responsible for providing a WRF that meets the requirements for IPR using injection wells, assuming a 2-month subsurface response time. The WRF product water shall be non-corrosive and have a minimum Langelier Saturation Index of 0.

- 4. **PCR, Part 2.9 Reverse Osmosis**, design criteria table, RO System Ancillary Equipment – for Optional 3<sup>rd</sup> stage, Item 2: RO High Pressure Pump: Revise criteria to: Horizontal multistage centrifugal or vertical turbine pump.

| Average Dry Weather Flow (ADWF)                         | 0.90     | 0.90                                         | 1.00          | 1.00                                              |
| Peak Dry Weather Flow (PDWF)                            | 2.08     | 2.08                                         | 2.74          | 2.74                                              |
| Peak Wet Weather Flow (PWWF)                            | 5.85     | 7.90                                         | 8.14          | 8.14                                              |

2. **Modeled Hydrographs:** Hydrographs were developed from the City's calibrated sewer collection system hydraulic model, and consist of the flow entering the WWTP from the City of Morro Bay only (i.e., excluding Cayucos flows). Three different scenarios are included. For each scenario, a seven day hydrograph is provided for the Average Dry Weather Flow (ADWF), Peak Dry Weather Flow (PDWF), and Peak Wet Weather Flow (PWWF) condition. Each scenario is described below. The hydrographs will be made available to potential proposers in Excel spreadsheet format through the City's Procore system.

- **Existing Condition:** These hydrographs represent the flow from Morro Bay that is conveyed to the WWTP without any improvements to the collection system. In the case of the PWWF condition, peak flows in certain areas of the collection system are "held back" in the collection system due to undersized sewer mains.
- **Existing Condition with Improvements:** These hydrographs represent the flow from Morro Bay that would be conveyed to the WWTP if improvement projects were constructed to mitigate capacity deficiencies in the collection. In the case of the ADWF and PDWF condition, the hydrographs are identical to the "Existing Condition" scenario. However, for the PWWF condition, peak flows that are currently "held back" in the collected system can now be conveyed to the WWTP, resulting in a higher PWWF that will reach the WWTP.
- **2040 Condition:** These hydrographs represent the flows under future (year 2040) flow conditions. This scenario assumes that the improvement projects included as part of the "Existing Condition with Improvements" have been implemented, and that there are no capacity restrictions in the collection system under year 2040 conditions.

## OVERALL MANAGEMENT APPROACH

# 01

## OVERALL MANAGEMENT APPROACH

Working side-by-side with the City and its consultants, we will collaboratively deliver a new WRF that provides robust and reliable performance at the lowest achievable cost.

The replacement of Morro Bay's aging wastewater treatment facility near the City's waterfront with a state-of-the-art water reclamation facility (WRF) located 1.5 miles inland, is an enormous challenge in terms of project siting, scoping, funding, design, permitting and delivery. With most of the up-front challenges addressed, the City is proceeding to the design, permitting and construction phase using a design-build (DB) delivery model. The collaboration that is the foundation of DB offers unmatched opportunities to create value through innovation.

The Filanc Black & Veatch (FBV) DB team's approach is based on taking full advantage of our combined talents and working side-by-side with the City and its consultants to collaboratively deliver a new WRF that provides robust and reliable performance at the lowest achievable cost.

### PROJECT SUCCESS THROUGH:

- Design-Build collaboration
- Budget-Conscious Innovative Design
- Expert Construction

We have carefully reviewed the RFP requirements and documentation; gathered information through our proprietary meetings with City staff; and conducted additional geotechnical investigations, research, and brainstorming. Together, we have developed a management approach that leverages our previous experience on major lump sum design-build water and wastewater projects in California and throughout the country. We are confident that the management approach described in these pages will successfully address each of the items listed in your RFP.

## PROJECT UNDERSTANDING

Replacing the existing Morro Bay-Cayucos Wastewater Treatment Plant (WWTP) is a major capital improvement project that has required significant planning, public outreach and technical analysis to ensure that the residents of the City obtain the best value for their investment. A major milestone in the planning process was completion of the Morro Bay Water Reclamation Facility Master Plan (FMP) by Black & Veatch Corporation. The FMP advanced the planning of the proposed new WRF and outlined many of the City's goals for it. Through this effort, our team has developed an intrinsic, first-hand understanding of the technical, administrative, environmental and ratepayer concerns associated with the project.

One of the drivers for replacing the existing WWTP is to meet the regulatory requirements of the federal Clean Water Act (CWA) and additional requirements defined by the State of California Regional Water Quality Control Board (RWQCB). The CWA defines the quality of treated wastewater that can be released to the environment. Treated wastewater from existing WWTP is currently discharged to the Pacific Ocean, offshore and north of Morro Rock. The existing plant cannot meet state and federal requirements for discharge to the ocean without significant upgrades. The RWQCB has required the City of Morro Bay to develop a new treatment facility by 2021. Another key factor that has driven the project from an upgrade to a replacement, is the California Coastal Commission's January 2013 direction to relocate the facility to a more inland area that is consistent with Coastal Act policies.

The requirement to build a new WWTP provides the City an opportunity to discontinue the daily discharge of treated water to the ocean and create a new, sustainable and local water resource. The uses under consideration for the water ranged from indirect potable reuse (IPR) through groundwater injection, to agricultural irrigation such as avocado orchards, and general irrigation for parks or golf courses.

The City's goal for the new WRF is to meet all discharge permit and recycled water reuse requirements for IPR through groundwater injection while ensuring economic value with a special emphasis on minimizing rate payer and City expense. To address these goals, our team brings both cutting edge global and local wastewater reclamation experience from the combined strengths of J.R. Filanc Construction Company's (Filanc) 65 years of California construction experience with Black & Veatch's global and local wastewater and treatment design experience. Together, our combined experience brings innovation and affordability to the benefit of the City of Morro Bay.

### OVERCOMING CHALLENGES TO CREATE VALUE

While every major capital improvement project has challenges, the new Morro Bay WRF faces several that are unique, requiring innovative solutions to meet the City's goals and objectives. Relocating a wastewater treatment facility from a low-lying area adjacent to the ocean with direct connection to its outfall presents a myriad of technical and right-of-way challenges in terms of influent and effluent conveyance. Our focus is on those challenges related to the new treatment facility itself. Three key challenges and strategies to mitigate them are presented below and on the following page.

## GOALS FOR MORRO BAY

Given our long relationship with the City in the development of project, we understand your goals for the WRF to be:

- ✓ A high quality plant that reliably produces IPR quality water for aquifer recharge
- ✓ Efficiently handles occasional high volume peaks
- ✓ Designed for efficient operations
- ✓ Minimizes capital cost
- ✓ Minimizes lifecycle cost

### NO COMPROMISE PLANT DESIGN

The primary challenge to the efficient design and operation of the new WRF is managing the variability between typical diurnal flows and peak flows created by storm events. The average daily flow to the plant is about 1 mgd, whereas the peak flows can exceed 8 mgd, albeit infrequently. A typical design approach to handle this peak would be to incorporate additional basin capacity to equalize the flow. However, due to the size of the peak and the infrequency of its occurrence, we've determined that the expense of that approach would be unnecessarily high. Our approach, as described in detail in Section 7, utilizes a standby filtration system to remove suspended solids during high flow events and blend it with treated baseline flows to reliably attain ocean discharge quality standards. We call this concept the Stormwater Adaptive Filtration Equipment (SAFE System). Using SAFE we can minimize both capital and life cycle costs, while allowing us to fully optimize the design and performance of the membrane bioreactor (MBR) based plant for operation under typical flows without any compromises.

### OPTIMIZING USE OF AVAILABLE SPACE

A second challenge for the WRF project is containing the cost of earthwork for construction. The South Bay Boulevard (SBB) WRF plant site, while currently undeveloped, features fairly steep topography with the only comparatively level area for construction along its eastern side. The underlying bedrock is overlain by a thin layer of clay rich colluvium. Through multiple iterations of 3D modeling of cut-and-fill scenarios and construction value engineering, we achieved a site development plan that eliminates the need for costly offsite disposal of the clay rich overburden, import of fill soils and construction of major retaining walls. Our balanced site approach not only minimizes earthwork costs, it creates an adjacent level area suitable for the future installation of a photovoltaic panel field.

### COST CONTAINMENT

As noted, the WRF is an ambitious project facing many challenges, each with the potential to increase costs. Our design approach is founded on the concept of cost containment without compromise in quality or performance. Our approach to collaboration and construction, maximizes the benefits of design-build to facilitate delivery and contain costs. In recent months, we have observed significant upward pressure on pricing in the water/wastewater infrastructure marketplace that may exceed the escalation factors of the RFP over the next year. The old adage that “time is money” certainly applies. Certain mitigation measures are available to potentially limit the impact of rapid price escalation. These include the use of early start packages to lock in early pricing. For example, early packages for major equipment, or site preparation could be authorized. While our experience using multiple GMPs is typically associated with schedule acceleration needs, it can also be used to hedge on price escalation.

## RISK MANAGEMENT

Risk management in the DB process is another area that we approach collaboratively because each party views risk differently. Depending up on Owner preferences and project criteria, the approach can be highly formalized using BV’s @Risk Model, or through a more generally using a Risk Register. Whichever is your preference, we are prepared to work with you to identify, assess, and plan to mitigate potential risks to the achievement of all project goals using the steps below.

- **Step 1 Risk Identification**
- **Step 2 Risk Evaluation, Mitigation & Quantification**
- **Step 3 Model Development**
- **Step 4 Model Output, Analysis & Recommendations**
- **Step 5 Implementation**

As a greenfield project with clearly defined performance criteria, we do not see the WRF project as having risks that are overly challenging to mitigate. The overarching risk to the project is associated with local approval of the project and its funding, which is beyond our ability to mitigate. **Table 1.1** on the following page identifies our view of the Top 5 Risks to your goals and objective and our mitigation strategy for each.

**TABLE 1.1: TOP 5 RISKS TO YOUR GOALS**

| RISK                             | DESCRIPTION                                                                                                         | IMPACT                                                                                       | MITIGATION                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scope Creep                      | Changes to project criteria, materials, processes during design phase                                               | Cost increase and/or schedule delay                                                          | Our detailed design and exhaustive estimating process for this proposal has significantly reduced the design-builder risk for scope creep. Collaboration and thorough Owner review during design will increase project definition. Monitoring and notification of potential change impacts will be performed by DB team to head off potential cost or schedule concerns. |
| Permitting                       | Delays in obtaining key permits to construct or for operations                                                      | Potential schedule delays and/or cost increases to address unanticipated agency requirements | Detailed review of permitting requirements during proposal design phase has minimized potential of significant permitting issues. Engagement of permitting specialists will aid in getting the project permitted.                                                                                                                                                        |
| Coordination with 3rd Parties    | Coordination challenges between DB, conveyance pipeline designer and contractor, Owner or Owner's Representative    | Construction delays, cost increase, inability to perform startup.                            | Include all parties as Stakeholders in project partnering. FBV experience in collaborative DB delivery will ensure complete coordination.                                                                                                                                                                                                                                |
| Local Workforce                  | Potential difficulty in staffing large project in Central Coast region                                              | Delays and/or excessive rework due to limited available workforce.                           | Filanc is signatory to local labor unions that consistently provide trained and qualified staff. As builder of the Cayucos Sanitary District WWTP project that will proceed the WRF, Filanc will have screened available labor to identify the most qualified individuals.                                                                                               |
| Unforeseen Subsurface Conditions | Unsuitable soil or bed-rock conditions not identifiable based on geotechnical investigations performed by Morro Bay | Delays and/or cost increase to address unacceptable soil conditions.                         | FBV performed targeted subsurface investigations during the proposal period in areas of greatest potential impact to our design to mitigate the collective risk.                                                                                                                                                                                                         |

## DIFFERENTIATORS OF THE FILANC BLACK & VEATCH TEAM

The FBV team brings tremendous technical depth and differentiating resources that ensure this project will meet each of its goals. FBV has already collaborated to successfully deliver an advanced water treatment plant over four times as large as the Morro Bay WRF. We are a team of DB experts that know how to work together to remove roadblocks to success. Our team Organization Chart previously presented in the SOQ has been updated to include additional differentiating resources and minor staffing changes since the submittal of our SOQ.

Key members of our management team—Gary Silverman, Chad Brown, and Omar Rodea—are California P.E.s and certified by the Design Build Institute of America (DBIA) as Designated DB Professionals. Proposed DB Project Manager (DBPM) **Gary Silverman**, brings a unique skill set that is specifically evolved for DB delivery. With more than 20 years of experience as a design professional followed by about seven years as a DBPM in construction, he has a complete understanding of the challenges that face each part of our team. With prior experience working as an Owner, he also has a first-hand appreciation of the challenges the City will face. Bringing these perspectives together is the fundamental art of DB. Gary has that experience including the recent completion of a nanofiltration plant for the City of Signal Hill and an UV/AOP treatment facility for the City of Monterey Park.

Construction Project Manager **Chad Brown** has worked almost exclusively on complex DB water and wastewater treatment facilities over the past 20 years. His experience collaborating with designers and owners before, during, and after construction is a true differentiator. Similarly, Preconstruction Manager **Omar Rodea** is uniquely qualified. His role, often overlooked by inexperienced design-builders, is the crucial link between design, estimating and construction. **Erick Bevington**, our Design Manager, has shown true skill in collaboration while leading our design team through the challenging process leading to the development of this proposal.

Designing and building a reliable, high-quality advanced water treatment plant that is affordable in terms of capital and operations expense is also a bit of an art. In developing this proposal, we brought nearly two dozen design and construction professionals together to evaluate potential solutions to the City's water treatment and reuse challenge, looking for the optimal approach. Chief Estimators **Bob Zaiser** of Filanc and **Mike Mackenzie** of Black & Veatch, who collaborated on a \$190M wastewater DB project for the U.S. Marines at Camp Pendleton, were deeply engaged to ensure that value decisions were made at each opportunity. Following award, our team will review our proposed design in detail with the City to begin the close collaboration needed to finalize the design to your satisfaction.

Startup and commissioning of complex water treatment facilities is also a challenge. Here again our team possesses unique capabilities. Design Manager **Erick Bevington** worked closely with **Marco Palomera** of Filanc to commission the Silicon Valley Advanced Water Purification Center in San Jose, one of the state's most complex plants of its kind. Coupled with beginning-to-end involvement of Filanc's affiliated electrical contractor, Big Sky Electric, we are confident that the startup and commissioning of the Morro Bay WRF will be well planned, efficient, and successful.

Filanc is currently serving as the Construction Manager at Risk (CMAR) for the Cayucos Sanitary District Sustainable Water Project. The benefit of this experience to Morro Bay is that we will have an established local workforce and a cadre of proven subcontractors ready to engage on the WRF project. The sequence of both projects is perfectly aligned to seamlessly move resources to ensure efficient delivery.

The FBV team is excited by the opportunity to further dig into the details of this project and work as the City's trusted partner to develop a solution that meets your goals and serves your community for many years to come.

## KEY SUBCONTRACTORS ADD VALUE THROUGH EARLY ENGAGEMENT SUBCONTRACTORS ON TEAM

A DB best practice that we fully embrace is the early engagement of key subcontractors to help create value through collaboration. Being part of the process also ensures that our subcontractor partners fully understand the project, its challenges and their roles in its successful completion. This commitment and buy-in dramatically reduces miscommunication and disagreements during construction, creating a more efficient and successful project delivery process.

The FBV team possesses tremendous resources and capabilities to self-perform most of the design and construction work needed to deliver the WRF. These capabilities allow us to tightly control the critical path of construction to ensure efficient delivery. In our qualifying SOQ, we identified three Designated Subcontractors that will be key contributors to the project; **Ashley + Vance Engineering**, **Big Sky Electric** and **Fraser Seiple Architects**. Each has contributed in their area of expertise to the development of this proposal and is ready help us deliver the project.

### ASHLEY + VANCE ENGINEERING (A+V)

---

**Ashley + Vance Engineering (A+V)** is a central coast civil and structural engineering firm headquartered in San Luis Obispo. A+V provides our team an understanding and appreciation of the local development environment to facilitate design, permitting, and construction of the WRF. We selected A+V based on their work quality and their collaboration with Filanc on design of Cayucos Sanitary District's Sustainable Water Facility. A+V's role will be to support civil and structural design needs and to provide permitting support.

### BIG SKY ELECTRIC

---

A critical aspect of treatment facility DB construction is the role of the electrical contractor—DB allows the contractor and electrical designer to collaborate to develop high performing, constructible and cost-effective solutions to power and control complex treatment equipment. **Big Sky Electric** specializes in electrical construction for water and wastewater treatment infrastructure and is a consistent partner with Filanc and Black & Veatch in its DB projects. Together, we have successfully completed projects totaling over \$200M in value, many using DB delivery. The principals of Big Sky have worked with Filanc for more than 20 years on projects including the West Basin Phase IV Water Reclamation Plant and with Black & Veatch on the City of Santa Monica Charnock Well Field AWTP. Both projects featured MF, RO and UV light disinfection among other advanced treatment technologies that will be part of the Morro Bay WRF. Big Sky will serve as electrical contractor for the project.

## FRASER SEIPLE ARCHITECTS

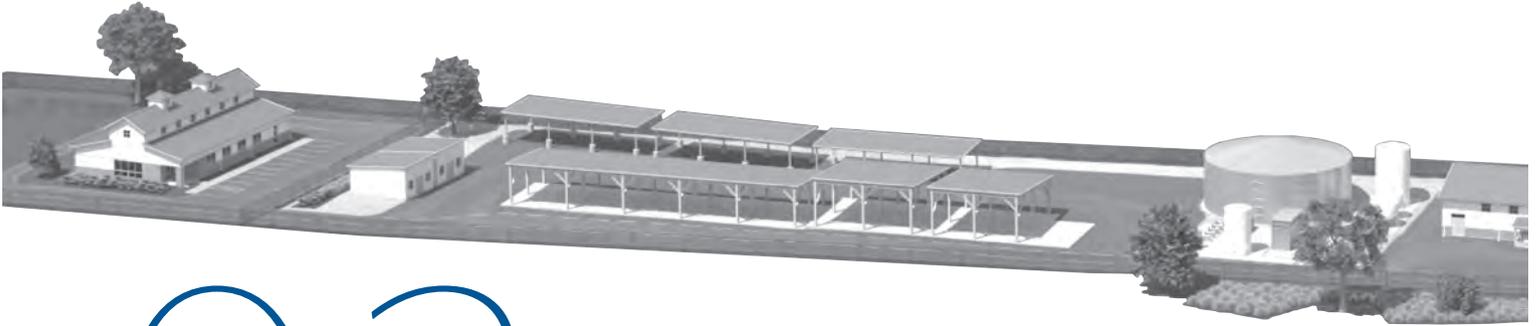

**Fraser Seiple Architects** is a full service architectural firm practicing throughout California and internationally. The firm's experience extends across a wide variety of project types and client types, and all work is approached with an orientation to careful management, technical competence, and design excellence.

## SUBCONTRACTOR PROCUREMENT PLAN

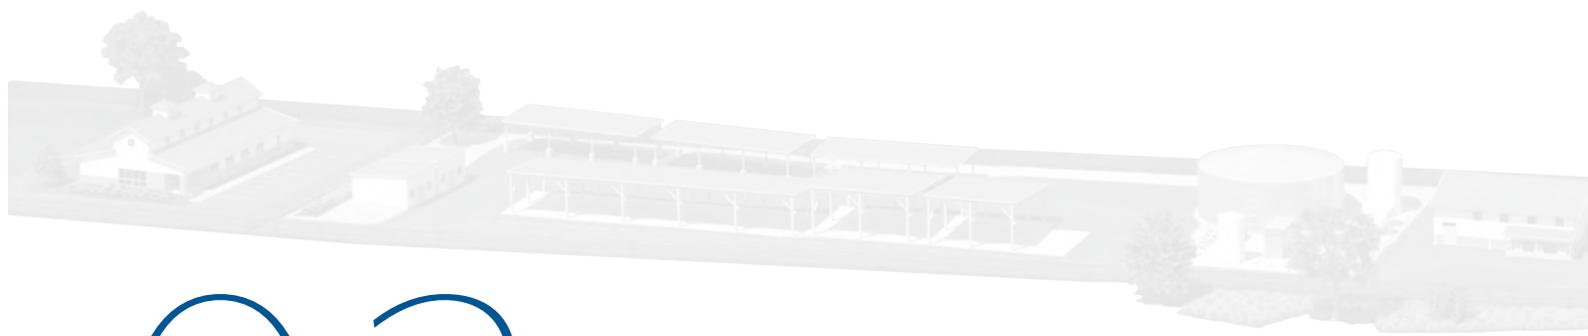

Given our team's deep roots in regional construction surrounding the City of Morro Bay, we carry longstanding relationships with local contractors. It is through these relationships that we are able to leverage a web of knowledge and provide cost competitive solutions from quality subcontractors. We have developed relationships with the local subcontractor market and understand how to ensure there is a capable workforce to construct this project. Beyond the civil and structural support from A+V and architectural design from Fraser Seiple, we do not anticipate the need to subcontract additional design services. We expect to self-perform structural excavation, concrete, piping, and process mechanical construction. We will seek subcontracting support for site grading, shoring, rebar, and coatings. We will also subcontract most architectural trades for the site buildings as well as paving and landscaping.

# 02

## QUALITY ASSURANCE/ QUALITY CONTROL

# 02

## QUALITY ASSURANCE/ QUALITY CONTROL

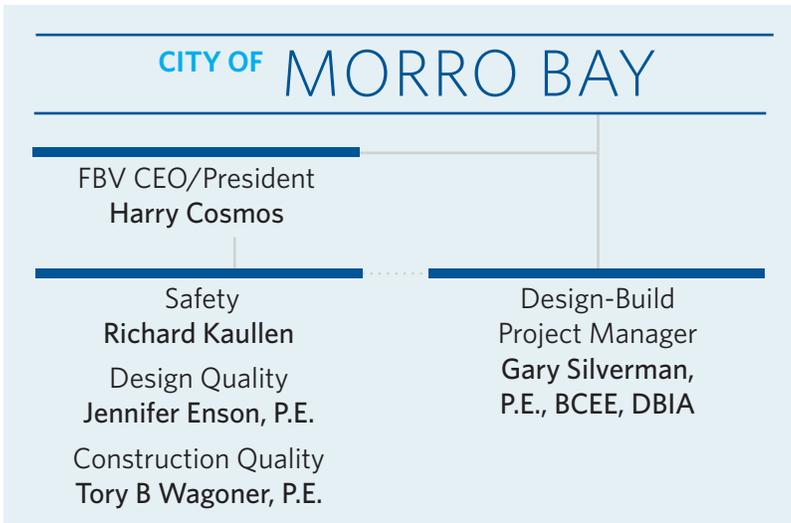

---

Our systems, processes, and procedures will aid us in delivering the WRF on time, safely, within budget, and with lasting quality.

The FBV team understands the need to build quality into all that we do to deliver a project on time, safely, within budget, with impeccable quality. These factors are implicitly linked, with quality being a driving force behind all aspects of a successful project. We have systems, processes, and procedures to help us maintain the standards that you expect. Quality is a process that merits diligent performance, management, feedback, and improvement.

### **QUALITY CONTROL TEAM & APPROACH**

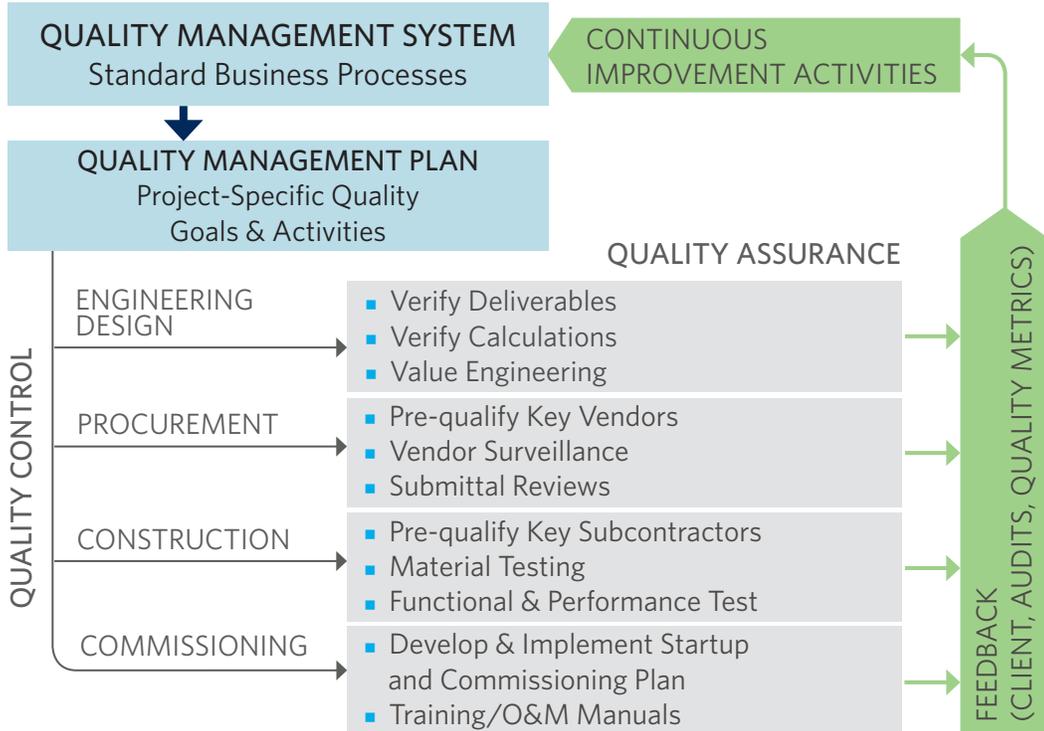

Our established design-build Quality Control Program addresses all aspects of quality from design through construction and startup. Under the direction of our Project Executive, Design and Construction Quality Control Managers not involved in the day-to-day management of the project, prepare and implement Quality Control Plans in their specific areas of responsibility. Documentation of quality reviews, inspections and corrective actions are recorded and maintained in our cloud-based Procore Project Management system, available to City representatives for review.

As shown on this excerpt from our Organization Chart previously presented in the SOQ, quality management is separate and independent from the Project Manager and reports directly to Project Executive, **Harry Cosmos**. Quality Management is a distinct unit consisting of a Design Quality Manager (DQM) and a Construction Quality Manager (CQM). **Jennifer Enson, PE** will serve as the DQM for the project and **Tory Wagoner, PE** will serve as the CQM. This Quality group has the authority to stop work until the work is brought into conformance with the Contract Documents.

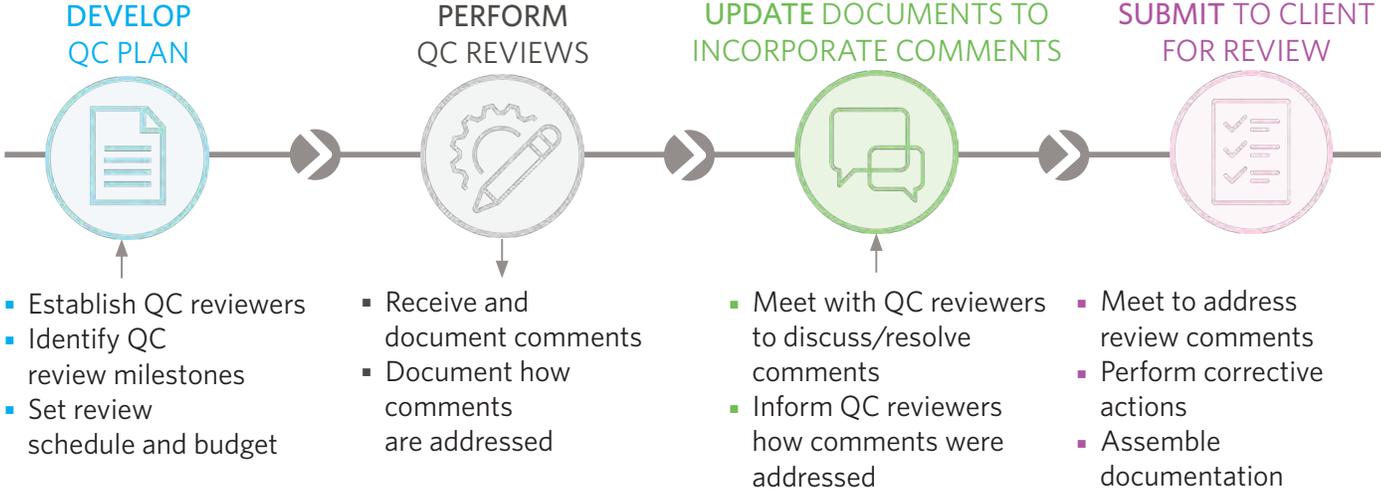

We recognize that designing and building a high-quality project requires both Quality Assurance (QA) and Quality Control (QC). As illustrated in the organization chart, primary responsibility for QA rests with those responsible for delivery of the work product. For this project, Engineer of Record, **Erick Bevington, PE**, will be responsible for the QA of our design work and **Chad Brown, PE** will be responsible for QA of construction.

**QUALITY PLANNING**

**FIGURE 2.1:** OUR INDUSTRY LEADING QUALITY ASSURANCE AND QUALITY CONTROL PROCESS IS BUILT ON DETAILED PLANNING, COMMITTED FOLLOW THROUGH AND CONTINUOUS IMPROVEMENT THROUGH FEEDBACK

FIGURE 2.2: DESIGN QUALITY CONTROL PROCESS

DESIGN QUALITY

As a full-service globally recognized design engineering firm, Black & Veatch employs a comprehensive design QA/QC methodology on each of its design projects in accordance with its Quality Management System (QMS). The Black & Veatch QMS is a system of planned processes and activities and formal documentation based on ISO 9001:2008 Quality Management Systems. It addresses all elements of the standard, to achieve client requirements, codes, standards, contracts, drawings, and objectives that are applicable to the project.

The QMS is a systematic process of monitoring and evaluation of the project to provide and maintain quality of the delivered products. QA activities and roles are identified as the project is scoped and are implemented throughout the project as deliverables are prepared. QC activities consist of independent reviews for technical, coordination, and readability needed to provide the detailed design for the project. For further discussion of our approach to Design Quality, please refer to Section 5.

Jennifer Enson, PE | DESIGN QUALITY MANAGER

Jennifer Enson, PE has more than 20 years of experience in the planning, study, design, and construction of water, recycled water, and wastewater facilities. Over the last ten years, she has managed procurement and design on projects totaling more than \$1 billion in construction including the Orange County Water District Groundwater Replenishment System.

CONSTRUCTION QUALITY

QA during construction will be the responsibility of Construction Manager, Chad Brown. Prior to construction, he will lead the development of detailed construction work packages for each discipline of work and include applicable construction specification sections, activity-specific quality considerations, a material list, material delivery dates, labor crew size, required construction equipment, drawings, and lay and lift drawings.

## Tory Wagoner, PE | CONSTRUCTION QUALITY MANAGER

Tory Wagoner, PE, has 20 years of experience in the construction industry serving as a project manager and construction quality manager. He is certified in Construction Quality Management for Contractors by USACE/NAFVAC.

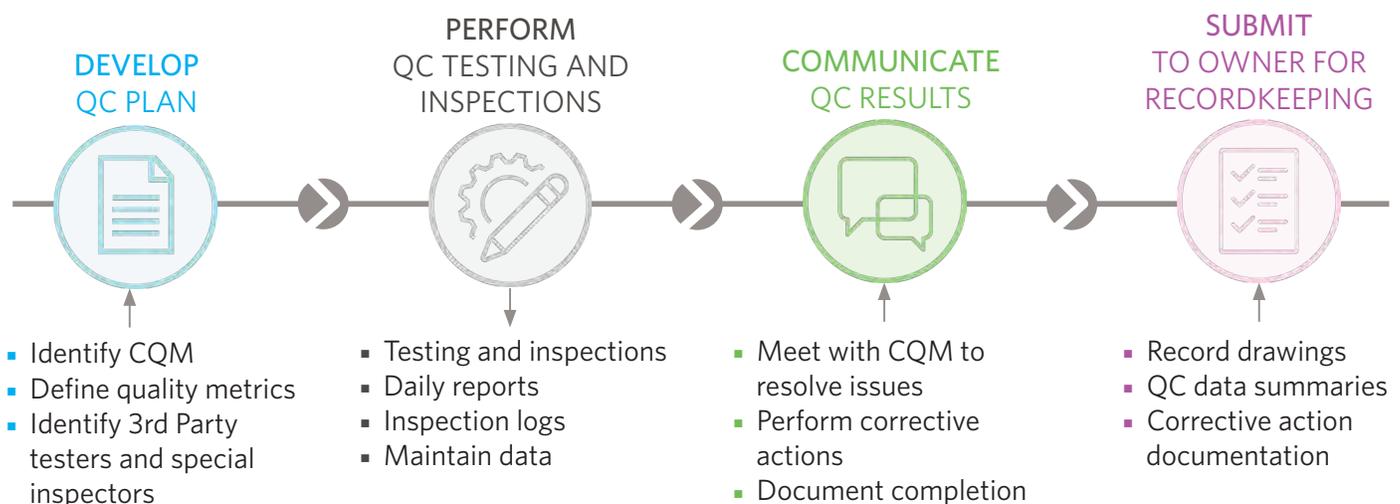

The packages will serve as the manual of construction that explains “How to Execute” each definable feature of work (DFOW). Means and methods, number of craft, estimated man-hours, and type of construction equipment will be evaluated to develop the best project plan. Communication is key to any construction effort. Creation of these work packages increases clarity and focus on each DFOW, improves safety, communication, and maximizes quality and productivity. Working with Superintendent, **Marco Palomera**, Chad will coordinate all third-party special inspections and testing with the City.

Tory Wagoner will serve as the CQM responsible for maintaining all construction QC reports and data. He will provide weekly updates to Project Executive Harry Cosmos and DBPM Gary Silverman who will monthly, review all construction quality issues with the City. Tory will conduct field inspections when construction is under way. The CQM is the key person involved with the day-to-day QC of construction activities in the field. He is responsible for, and has the obligation to stop work in areas that have not met requirements.

The CQM’s responsibilities also include:

- Organizing, conducting, and reporting on the QA/QC status to the Project Executive and Manager
- Collecting and reviewing subcontractor’s quality control plans
- Auditing logs and submittal packages sent to the City
- Reviewing as-built drawing packages
- Ensuring proper documents and project revisions are used during all phases of construction by all affected trades and subs
- Collecting jobsite photos of the ongoing construction progress

**FIGURE 2.3: CONSTRUCTION QUALITY CONTROL PROCESS**

**COMMITMENT TO SAFETY**

FBV maintains a solid safety program that helps us consistently deliver work safely. We place the highest importance on the safety and health of our people, clients, and the public during the performance of our work. For our employees, it means everyone goes home at the end of the day without incident. For our clients it results in fewer delays and lower costs. As a standard of practice, we work with clients to meet project-specific safety considerations in addition to industry best practices and regulatory standards.

Our safety and health programs, policies, and procedures incorporate best practices and lessons learned based on our understanding of regulatory and legal considerations as well as our experiences from all over the globe. Black & Veatch is a member company of the Construction Industry Institute (CII) and has incorporated much of its research into formal policies and procedures. Filanc has an extensive record of safe construction spanning many decades and resulting in numerous local and national awards. Our well-established approach is based on proven safe work practices and innovative methods that improve communication and eliminate complacency about safety.

Our safety goals for all projects include:

- Zero injuries at the workplace including subcontractors, Owner personnel, delivery personnel and visitors
- Zero injuries to the public
- Zero environmental issues

During project planning, our Corporate and Site safety personnel, Construction Manager, Superintendent and CQM develop a site-specific health and safety plan to identify and address safety, health, and environmental concerns that may arise in the performance of work. Our project safety plan includes provisions for all potential people onsite, and all people onsite will be given a briefing on the safety protocol and provided the necessary PEP. This site-specific safety plan will include the following methods to ensure safe work practices are continuously observed by our team and all subcontractors.

- Training and inspections, record-keeping, and oversight of all aspects of safety
- Orientations for all tradespeople to cover each site’s unique concerns, including thorough discussion of rules for working on-site
- Regular monitoring by our corporate safety officers for continuous recommendations and improvement
- Required submission and approval of all subcontractor safety programs and ongoing confirmation of compliance
- Accurate record-keeping of all work hours and reportable incidents

**FILANC**

**THE TABLE OF CONTENTS ABOVE IS FROM A PREVIOUS HEALTH AND SAFETY PLAN PREPARED BY FILANC TO IDENTIFY AND ADDRESS SAFETY, HEALTH, AND ENVIRONMENTAL CONCERNS.**

- Regularly scheduled audits conducted with project management and field supervisory staff
- Establishment of a first-response team who is prepared and ready to act in the event of any emergency
- Assurance that all Activity Hazard Analysis (AHA) documentation is kept up-to-date

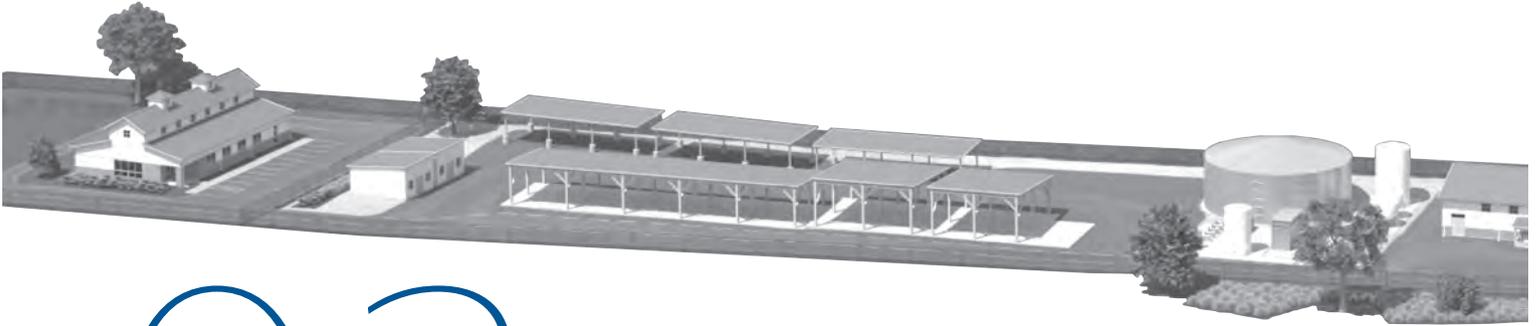

**ESTABLISHING A CULTURE OF SAFETY**

Part of our tireless dedication to our culture of safety is the direct involvement of our entire team, from executive management to the craft workers in the field. Project executives will provide oversight of safety performance for the Project, giving personal attention to the cause and subsequent rectification of any safety issue.

Safety will not be sacrificed for production but rather considered an integral part of quality control, cost reduction, and job efficiency. As such, all superintendents will be keenly aware of the safety performance demonstrated by the employees under their supervision. Each employee has the responsibility to work in a safe manor. If they see something that is not safe, they have a responsibility to report it to their supervisor, and if it poses a risk to them, not to expose themselves to the hazards. This is also reinforced through the site-specific safety orientation and twice-weekly toolbox talks.

## PROJECT CONTROLS AND COST TRACKING

# 03

## PROJECT CONTROLS & COST TRACKING

---

FBV employs robust, best-in-class project control and document management measures to fully inform the City of our progress.

As industry leaders in major facility design and construction, the FBV team employs robust, best-in-class project control and document management measures. From notice to proceed to final close out, the City will be fully informed of our progress in terms of cost, percent complete and schedule performance. By delivering the project as a team, with full participation and buy-in from all participants, we will virtually eliminate miscommunication, quickly resolve potential concerns and deliver a high-value, high-performance facility that the residents of Morro Bay can count on for decades to come.

### **SCOPE, COST & BASELINE SCHEDULE DEVELOPMENT**

To prepare this proposal, we reviewed the RFP performance criteria and vetted various design concepts with the City in our proprietary meetings to define the project scope and our approach. That understanding is reflected in our initial design, schedule, and proposed GMP to construct the Morro Bay WRF project.

Following our selection and Notice to Proceed (NTP), we will transition to the Preconstruction Phase. The primary activities to be completed during preconstruction will be completion of the design, development of subcontractor bid packages, developing the baseline schedule and establishing our accounting framework.

**DBPM Gary Silverman** will lead the team, supported primarily by **Design Manager Erick Bevington**, **Preconstruction Manager Omar Rodea** and **Construction Manager Chad Brown** throughout the life of the project. As DBPM, Gary Silverman will have overall responsibility for budget and schedule management. However, day-to-day responsibility for management of the design budget and schedule will be held by Erick Bevington. Similarly, Construction Manager Chad Brown will be responsible for management of the construction budget and schedule.

**Preconstruction Service Manager Omar Rodea** will lead the creation of the accounting framework for the project working with our management, estimating, accounting and procurement teams. This process will include further developing the Work Breakdown Structure (WBS), establishing cost codes and assigning budgets informed by the GMP breakdown from our estimating team. A Schedule of Values (SOV) will also be prepared and submitted to the City to serve as a basis for progress payments. The SOV may be adjusted from time-to-time as the subcontracting plan is finalized.

The construction budget will be managed within ViewPoint, our accounting management system, to facilitate logging of self-performed direct labor, payment of local subcontractors and suppliers, compliance with state prevailing wage and subcontractor Public Works Contractor Registration and certified payrolls in accordance with CA SB 854. We will collaborate with the City's construction management staff to ensure that our invoicing procedures are consistent with any grant or loan payment application the City may need to prepare. In addition, our project management and accounting personnel will monitor the utilization of small, minority or disadvantaged businesses in accordance with requirements that may apply based on the requirements of the funding agency.

Weekly review of project schedule and budget status will be conducted by **Construction Manager Chad Brown**. Budget performance evaluations relative to schedule will be performed monthly by Chad and DBPM Gary Silverman for internal reporting of Estimated Cost at Completion (ECAC) and to accompany monthly invoices to the City. Quarterly "Deep Dive" accounting reviews will be performed by Filanc Black & Veatch JV executive staff to uncover potential concerns and enact corrective actions, as needed. In addition, at key design milestones, we will update the project cost estimate to confirm that scope changes can be accommodated within the GMP.

Chad Brown was a key contributor to the development of the initial schedule presented in Section 6 of this proposal. As Construction Manager, it will be his responsibility to lead the development of the contractual Baseline Schedule. The schedule will be developed in Oracle Primavera P6 and cost-loaded to facilitate

cash flow projections and reporting. Development of the Baseline Schedule will be a collaborative effort between our design, estimating, and construction management staff as well as the City and its representatives. Chad will lead the development of the project schedule sequencing and logic and will be supported by P6 scheduling software expert Marsha Peterson.

When the baseline schedule is near completion, we will host a workshop with the City and key project stakeholders to verify that we have appropriately accounted for project constraints, permits, agency review durations, etc. Incorporating updates resulting from this workshop, the baseline schedule will be submitted for review and approval prior to the start of major construction work activities.

The approved project schedule will be updated each month until the project is complete. Each schedule update will be built upon a copy of the previous month's schedule so that progress can be tracked and verified over time. The actual start and completion dates of construction activities will be documented within our daily reports and look-ahead schedules — these dates will then be documented within the monthly project schedule update(s).

The projected completion (remaining duration) for in-progress activities — i.e. those activities started but not yet complete — will be confirmed by the project's superintendent, subcontractors, and/or our material and equipment suppliers. With this information input within the database, Primavera P6 will calculate the forecasted start and completion date for all remaining work activities, including the substantial completion date and the project completion date based upon critical path methodology.

A printed copy of each month's schedule update will be submitted to the City. Additionally, a PDF copy of the schedule update and the P6 (.XER) schedule data file will be provided along with a schedule narrative to assist the City in its review of the update. The narrative will include a summary of the month's progress, a description of the Critical Path, and highlight any notable items important to the completion of the project, such as the progress of permits, delivery of equipment, and the identification of any potential or anticipated issues so that they may be resolved prior to impact. Special reports and/or filters can also be provided at the City's request.

THIS PAGE INTENTIONALLY LEFT BLANK

### DOCUMENT MANAGEMENT

To facilitate communication, collaboration, and accurate record keeping, all project information will be maintained in Procore, our cloud-based project management platform. City staff, construction management, and other designated personnel will be provided rights-based internet access to Procore. The system will contain information such as plans, specifications, requests for information (RFIs), purchasing control register (PCR), submittals, potential change order log, change orders, schedule, daily reports, permits, photographs, meeting minutes, and agendas. Because Procore is our standard project management platform, there will be no charge for the City to access information. In addition, should the City or its consultants require training or support in the use of the system, our **Procore Administrator Cat Shea** will be readily available.

### CatShea | PROCORE ADMINISTRATOR

My day job is to serve as an internal resource to help our design, construction management and client staff make the best use of our Procore Construction Management platform. I develop new tools, audit projects, serve as a “help desk” and train staff. As the Procore Administrator for the Morro Bay WRF project, my goal is to help the entire project team communicate at the highest level.

**FILANC** | J.R. FILANC CONSTRUC... PN-2017-136 - Morr... | TOOLBOX Home | FAVORITES Directory Documents Home | ? NS

#### PROJECT HOME

**WELCOME**

Welcome to the Morro Bay Water Reclamation Facility Project Procore Site.

This site is hosted by Filanc Black & Veatch as the central hub of this exciting design-build project. Through Procore we will facilitate collaboration, document distribution and record keeping.

If you have any questions on how to use this system, please contact Cat Shea our Procore Administrator.

---

## COLLABORATION AND INTEGRATION

# 04

## COLLABORATION & INTEGRATION

**PERSPECTIVE:** Design-build delivery succeeds when needed skills and perspectives are truly integrated to form a high-performing team.

**RESPECT:** Teams succeed when each member respects the perspectives and contributions of the other.

**COMMITMENT:** Filanc Black & Veatch is fully committed to lead the integration and collaboration of the Morro Bay WRF project team with a “project-first” focus while respecting the contributions and perspectives of all stakeholders

### CREATING A COLLABORATIVE ENVIRONMENT

Through experience gained from working with clients like the City of Morro Bay, our integrated DB team has developed a philosophy founded on the following tenets:

- By partnering with the City, we will adopt your goals and vision for the project, and then work tirelessly to ACHIEVE IT.
- Provide objective, documented proof that all contract requirements have been met or exceeded.
- As an integrated member of the project delivery team, be fully open, honest, and transparent in all dealings with you and your representatives, and with our own subconsultants, subcontractors and vendors.
- Demonstrate our commitment and investment to the local economy through our employment and buying practices.
- Foster an integrated environment where cooperation among operations, maintenance, design, construction, and start-up staff results in facilities with higher value than can be attained through other project delivery models.
- Establish and maintain a collaborative environment in which City staff, your representatives, and our employees can grow professionally, expand their skills, and have an enjoyable project experience.

## COLLABORATIVE PARTNERING & INTEGRATION

We have gotten off to a great start in meeting your goals by assembling a terrific team to address the needs of the WRF project. Our design and estimating personnel have spent countless hours assessing and reassessing best value approaches to solve your treatment needs. Our focused proposal effort is clear indication that this team is poised to deliver an exceptional project that provides the residents of Morro Bay an affordable, yet state-of-the-art, facility in an enjoyable and frictionless manner.

Establishing internal teamwork is only the first step in a successful DB project. Fully engaging the City, its staff and consultants is the next critical step in the process. During the proposal phase, we approached the Proprietary Meetings with you like we would a design workshop after award. Our objective was to present our ideas and seek your feedback, including preferences and concerns. Based on our limited interaction to date, we are confident that the combined WRF delivery team will function at the highest level.

Once we are selected as your design-builder, collaboration and integration efforts will really take off. We have suggestions on how to proceed, but we are flexible and prefer to develop our approach collaboratively with the City and its consultants. We typically advocate a series of team-building workshops, meetings, and activities aimed at co-developing our technical approach to the project while encouraging and developing teamwork. These workshops and “over-the-shoulder” reviews will be identified in our baseline design schedule.

To get the project off on the right foot and to provide an early roadmap for executing the work, we advocate formal partnering for the project. We have decades of experience participating in formal and informal partnering to facilitate collaboration with all project stakeholders. We typically develop a Partnering Charter to memorialize our commitments to each other and set mutual goals for the team to meet to consider the project a success.

---

### Gary Silverman, PE, BCEE, DBIA | PROJECT MANAGER

The past seven years as a design-builder with a construction firm has been an eye-opening experience. With more than 20 years of prior experience as a designer, Owner, and regulator, I now have a full 360° perspective of DB project delivery. Drawing on the benefits from my experience to enhance collaboration is what makes my role of DB Project Manager most rewarding.

## Erick Bevington | DESIGN MANAGER

Early in my career, I was a field engineer on the 45-mile, \$180M Lake Nacimiento aqueduct project providing construction phase support. I observed the importance of collaboration between and design and construction first-hand. As Design Manager for the Morro Bay WRF, I am committed to fostering collaboration at all levels and look forward to working in the Morro Bay area again!

### COMMUNICATION PLAN

As part of our overall Project Management Plan, we will prepare a Project Communication Plan. **Gary Silverman**, our proposed DB Project Manager, will be the primary FBV team member responsible for managing the communication and coordination processes with the City and its consultants. Together, we will utilize various forms of verbal and written communication during execution of the project. We will utilize Procore to record, store and disseminate documents and images generated by project participants including:

- Telephone conversation reports
- Meeting minutes
- Action item and decision logs
- Conference call notes
- Emails
- Progress reports
- Technical memoranda and written reports
- QA/QC documentation
- Drawings and specifications
- Construction management documents
- Project management documents
- Submittals and shop drawings
- Requests for Information (RFIs)
- Progress photos

### CONFLICT RESOLUTION

One of the many reasons we prefer to deliver work by DB is that through early integration and collaboration, the chances for significant conflict is greatly reduced. In our experience, DB projects proceed more smoothly, with significantly fewer change orders and disputes and have better outcomes. For the rare instances that require conflict resolution, our policy is to resolve all disputes expeditiously at the lowest possible level. We resolve issues in a fair, reasonable and informal manner using “win-win” negotiations to ensure all parties are satisfied.

We typically include the development of a dispute resolution matrix as part of our partnering efforts at the outset of the project that carries over into our Project Communication Plan. As part of our partnering approach, we will align our team members with their appropriate counterparts for resolving problems and conflicts. This alignment means individuals from the City and FBV will be assigned a counterpart from the other organization for resolving issues on the project. As issues and challenges are identified, assigned parties will work together to resolve them as they arise.

### CO-LOCATION

The successful delivery of the project will be driven by teamwork, collaboration, and the effective integration and management of many components. Close collaboration will be essential to keep the project progressing on schedule and within budget. FBV is committed to co-locating key staff with City staff on or near the project site. Co-location promotes partnering, collaboration, accountability, innovative solutions and ideas, timely decisions, and ownership of project objectives by all stakeholders.

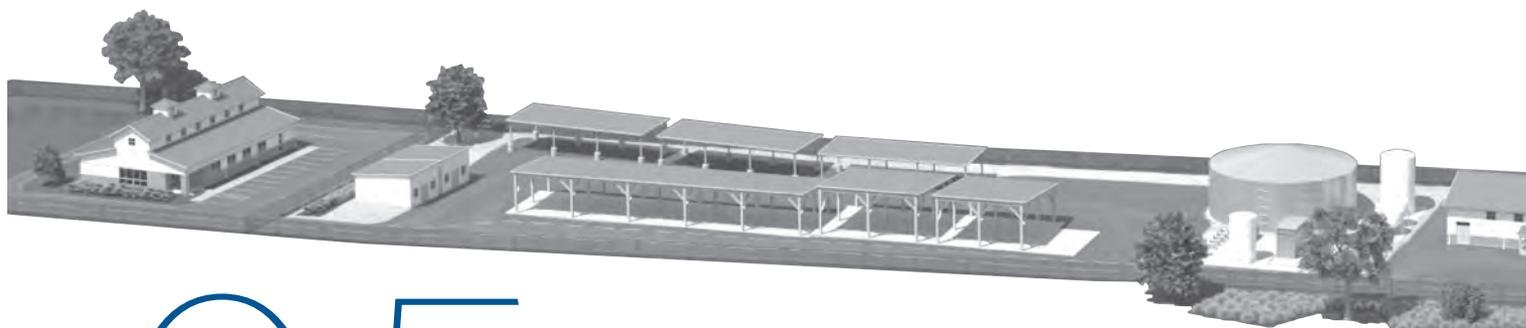

In addition, co-location of design and construction personnel with shared tools and databases will streamline communication and enhance problem-solving and decision-making as the team works through day-to-day challenges. In the end, Morro Bay receives a design that has benefited from the integrated perspectives of all team members. Working together day-to-day enables key team members to be responsive to the project needs, including schedule, budget, design and construction issues, and operational concerns.

We are happy to consider using the potential office space available for co-location. Other options we will consider include:

- Mobilizing construction trailers to the site that have offices and meeting space, as well as connectivity for collaboration tools and resources sharing. This can accommodate design and construction team members, as well as city staff, and places the team directly on site during design and construction, which provides additional benefits.
- Renting available space in downtown Morro Bay to house key team members. This option can augment the City offices or the mobilized trailers if additional capacity for team members is needed. It can also be a long-term solution if this level of facility is desired for the duration of the project.

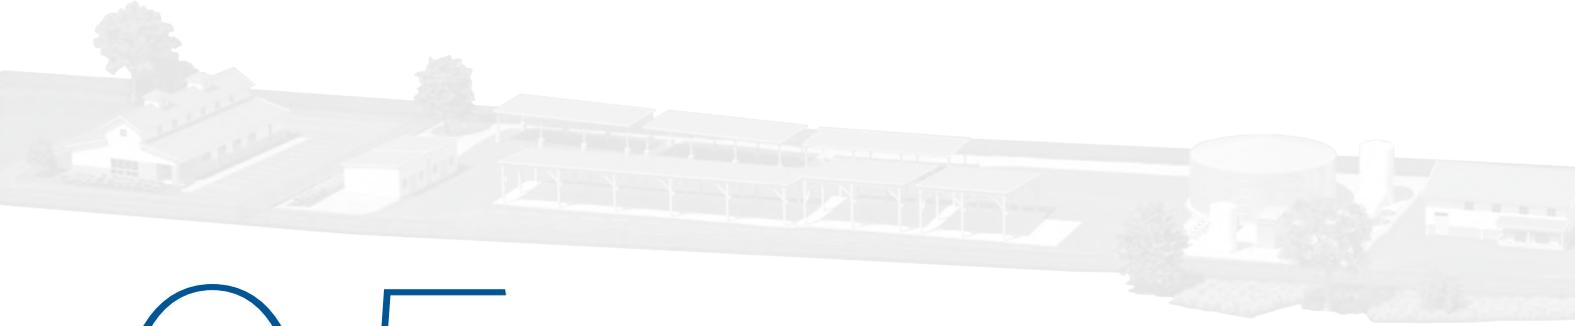

It is important for every team member in a DB project to recognize that every decision they make impacts budget and schedule. Therefore, seamless execution comes through careful planning and intentional collaboration. Our team will capitalize on the integrated nature of DB practices to manage the team and the process in a manner that is efficient and well-defined.

# 05

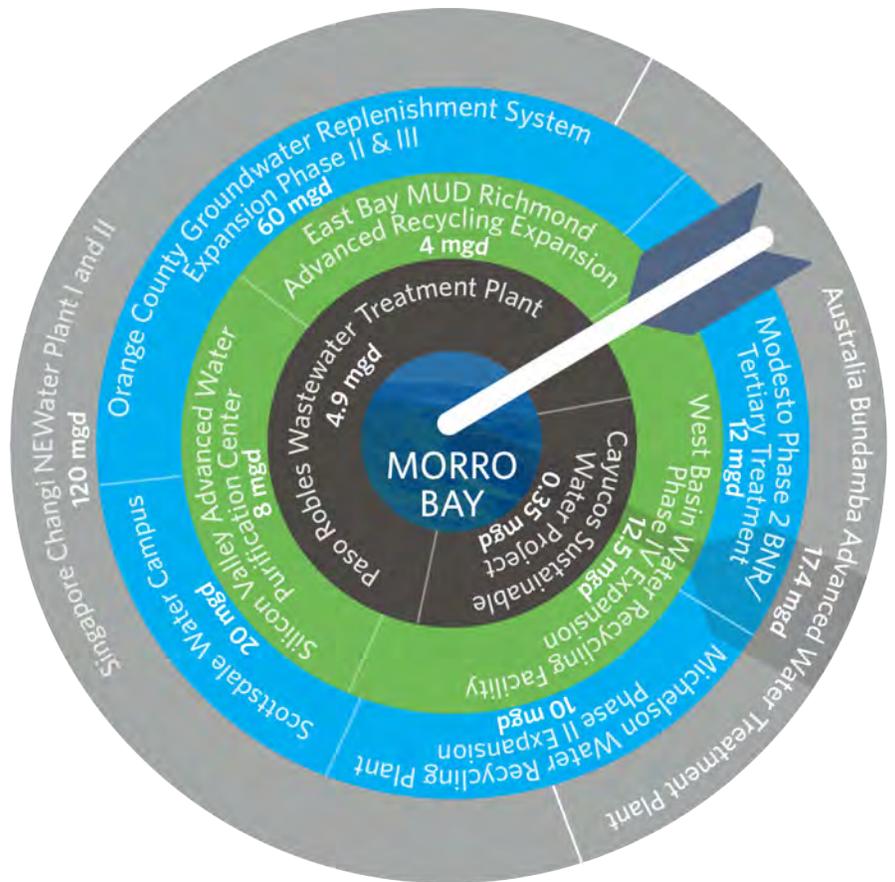

## DESIGN DEVELOPMENT AND MANAGEMENT

# 05

## DESIGN DEVELOPMENT & MANAGEMENT

Together, the FBV team has designed and constructed more than 268 mgd of recycled treatment facilities globally and locally. We have leveraged this experience to offer Morro Bay a state-of-the-art facility that also meets the City's affordability goals.

---

The FBV DB team will successfully deliver this project through teamwork, collaboration, communication with stakeholders, and the effective integration of design, construction, and operations.

## APPROACH TO DESIGN, USING DESIGN TOOLS & MANAGING THE PROCESS

The successful delivery of this project will be driven by teamwork, collaboration, and the effective integration and management of many components. From design to construction to operations to communication with stakeholders - working together is the key benefit of DB. Communication within the team is encouraged to maximize the integration and collaboration of all team members, including Morro Bay staff and consultants. While frequent and open communication often occur as a result of co-location and collaboration, regularly scheduled meetings will maintain the flow of critical information and provide updates on schedule and budget throughout the life of the project.

DB Project Manager Gary Silverman and Design Manager Erick Bevington are responsible for design development of the project. They will work with Morro Bay and the team to progress the design forward for construction-ready documents and will be responsible for communicating design decisions and information to the entire team.

The project design is currently at 30% and our internal design development process has integrated operations, commissioning, estimating, construction, permitting, and quality control professionals. It is critical to the project's success that we continue to involve Morro Bay and these key team members as the design is finalized. In addition to regularly scheduled project meetings, we will hold focused workshops to ensure our team has thoroughly considered alternatives and options before the design is finalized.

---

### Gary Silverman, PE, BCEE, DBIA PROJECT MANAGER

Gary has devoted his 35-year career to the water/wastewater industry in leadership roles as a design consultant, an owner and a contractor. He gained valuable perspective from this experience, enabling him to hone a management approach based on proactive communication and consensus building. Quality work, innovative problem solving, and customer satisfaction are common features of Gary's projects. He has led many alternative delivery projects as either DB Project Manager or Design Manager. In these roles, Gary has been uniquely positioned to drive team integration, enabling Owner's like the City of Morro Bay to realize the true value of DB project delivery, including having a little fun along the way.

---

### Erick Bevington, PE DESIGN MANAGER, ENGINEER-OF-RECORD

Erick has led the design team and disciplines in developing our proposed design. He has led multi-discipline teams on WWTP projects up to 330 mgd, and also has field experience that enhances his leadership in this role. Erick was the engineering manager for construction and startup of the Silicon Valley Advanced Water Purification Center (working with Filanc), and was on-site in the central coast community for three years during construction of the Nacimiento Water Project. This combination of experience provides him the ability to evaluate design decisions based on treatment goals, as well as the context unique to wastewater treatment along the coast.

FIGURE 5.1

## PHASE 1 & 2 DESIGN MANAGEMENT PROCESS

Partnering with Morro Bay will be integral to meeting critical path milestones (blue) and maintaining delivery of this project in accordance with the schedule and budget.

### FINALIZE DESIGN APPROACHES & CONCEPTS

#### PHASE 1: NOTICE TO PROCEED/PROPOSAL DESIGN UPDATE

- Partnering workshop
- Set-up collaboration center
- Design intent meeting
- Update design schematic
- Update Revit 3D model
- RO energy recovery and acid addition study
- Update design schematic
- Finalize and begin implementing permitting strategy
- Update schedule and budget

### FINALIZE CONSTRUCTION BUDGET

#### 60% DESIGN DEVELOPMENT

- Update design
- Review specifications
- Continue permitting meetings with agencies
- Value engineering
- Review 3D Revit model for operations functionality / design input
- Update schedule and budget
- Value engineering
- Constructability workshop
- Plant operations and commissioning strategy meeting
- Draft start-up plan

### FINALIZE DESIGN IN ACCORDANCE WITH FINALIZED CONSTRUCTION BUDGET

#### 90% CONSTRUCTION DRAWINGS

- Update and finalize design
- Review 3D Revit model for operations functionality / design input
- Finalize specifications
- Continue permitting meetings
- Update schedule & budget
- Workshop
- Final start-up plan

#### PHASE 2: MOBILIZATION

- Begin construction
- Permit drawing set
- Review shop drawings
- As-builts
- O&M/start-up meetings
- Training plan

We use a variety of software during design to develop and manage aspects of the project:

- **BIM+ Lifecycle Design** - Our team developed this design using Building Information System Plus software called Revit. The model can be used from day 1 of the project and provides many efficiencies for design, allowing disciplines to work concurrently on designs that contribute to the overall 3D model. Changes are populated throughout the platform so the team is always working with current, and up-to-date information.
- **Timberline** - Cost model development, estimating, and GMP development provides the ability to track cost models and trends, and identify the impact of design options prior to a final decision.
- **Primavera P6** - Integrated schedule development
- **Drones** - Our procedures include photo documentation of pre-construction conditions and construction progress. We have also had great success in capturing difficult to obtain photos and inspection data.

## APPROACH TO VALUE ENGINEERING

To build on the value engineering (VE) that our team has already instituted during design development during the proposal stage, we will continue to hold VE and constructability sessions to ensure the final design is of the highest quality and provides the best value for Morro Bay. We will engage a mix of team members to ask questions that probe alternative thinking and challenge engineering designs. The goal is to drive the group toward design decisions that are cost effective, safe to build and operate, provide long-term life cycle benefits, and meet the capacity and regulatory compliance objectives of the project. Constructibility and VE sessions are conducted in a workshop setting with key team members from design disciplines, preconstruction, construction, commissioning, Morro Bay, external stakeholders, and your program manager and consultant(s).

## MANAGING QUALITY CONTROL & QUALITY ASSURANCE

In Section 2, we described our approach to quality management for the project through the design and construction phases. For design, we identified the roles of Design Manager Erick Bevington, responsible for Quality Assurance (QA) and Jennifer Enson serving as Design Quality Manager (DQM) responsible for Quality Control (QC). Following our selection, they will develop a project-specific Design Quality Plan (DQP) as a key component of the overall Design Management Plan. Thirty days prior to Notice to Proceed (NTP), the DQP will be submitted to the City for review and approval.

The DQP will identify a Technical Advisory Committee (TAC) with appropriate technical expertise to provide independent input to assure that design will proceed based on proper assumptions and sound decisions. The TAC will support Jennifer and provide additional input at all stages from the schematic design step through the 60% milestone through 90% construction documents, through as-built drawings at completion of construction. The DQP will define a schedule and scope for design quality control (QC) reviews, corrective action procedures, and communication protocols with the City. It will also document the City's critical success factors for how design quality is defined or monitored.

## DESIGN CHALLENGES

**TABLE 5.1**

| CHALLENGES IN DEVELOPING THE DESIGN                                                                                                                          | SOLUTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| High peaking factor                                                                                                                                          | FBV proposes an innovative and cost-effective treatment process to address high flows due to storm events, while reliably meeting ocean discharge limitations. Our solution is based on the use of disk filters to treat storm flows. The combination of disk filtration, with an MBR system results in a state-of-the-art facility that improves treatment over the current WWTP from both an operational and effluent water quality perspective.                                                                                                                                                                                                                                                          |
| Unknown mineral water quality can impact RO system design and operation resulting in reduced flux rates and lower production rate and increased energy costs | <p>FBV leveraged our past experience designing six other recycled treatment facilities in California to:</p> <ul style="list-style-type: none"> <li>■ Review three years of Morro Bay’s drinking water source quality and estimating the average concentrations of key inorganic parameters present in Morro Bay’s drinking water over a range of source water blending conditions</li> <li>■ Determine wastewater concentration factors from other recycle facilities with similar source water and estimated the ratio of RO feed water concentrations for both pre and post drought conditions</li> <li>■ Apply wastewater concentration factors to estimate feed water quality for RO system</li> </ul> |
| Efficient site layout to minimize costs                                                                                                                      | <p>FBV developed a site layout that:</p> <ul style="list-style-type: none"> <li>■ Balanced the cost of reducing excavation against placing compacted fill</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Challenging site layout due to hilly terrain                                                                                                                 | <ul style="list-style-type: none"> <li>■ Eliminated the need to import fill material</li> <li>■ Reused excavated material on-site for fill material</li> <li>■ Spreads unused excavated material on site and eliminates need for hauling materials</li> <li>■ Minimized retaining walls</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                          |

The findings and documentation of the QC review process will be presented internally to Project Executive Harry Cosmos and DBPM Gary Silverman as independent confirmation that they are taking place and that corrective actions, if any, are implemented. On a monthly basis, Gary will review the results of our design quality management process with the City. All QA/QC documentation and reporting information will be stored and made available to the City via our Procore project management system.

## MANAGING THE PERMITTING PROCESS

Permitting for DB projects requires a proactive plan to ensure all the benefits and value of DB can be leveraged, and mitigate the unforeseen regulatory conditions creating delays. Our permitting approach includes:

- Early engagement with agencies (meeting with them ahead of time to discuss the project and getting feedback on the submittal requirements and process)

## KatieZusy, PE

PROCESS MECHANICAL

Katie led design of the UV disinfection and cloth media filtration systems and plant hydraulics for a Title 22 reuse project for Irrigation for the Paso Robles Tertiary Treatment Facilities. She attended design workshops, client meetings, and the HAZOP meeting. Kaitie attended weekly construction meetings and coordinated engineering services. She will lead the process mechanical design for the Morro Bay WRF. She has worked with Erick Bevington on WWTP projects up to 330 mgd.

## SandeepSathyamoorthy, PH.D.

PROCESS ENGINEER

Sandeep is an expert on treatment and removal of emerging contaminants. He has worked on DB projects for recycled treatment facilities, including MF/UF and RO design, in CA and throughout the U.S. As a Process Innovation Leader within Black & Veatch, he has led process design for this project. He has developed solutions, such as the SAFE System, that keep the project affordable without compromising any state-of-the-art technology.

- Developing a permitting matrix so things do not fall through the cracks
- Using existing well established relationships and developing new relationships with agencies and reviewers
- Continually checking in on the status of the reviews and addressing any comments/concerns immediately
- Tracking the status of each permit with the matrix

By meeting with regulatory agencies early and informing them of the project schedule, they will have an opportunity to provide us with their requirements for issuing the permit. It is imperative to keep communication open until the permit is awarded to ensure the project schedule is not negatively impacted. All requirements, contacts, and actions will be tracked on the matrix to ensure timely response and management of each critical item.

### SAFE SYSTEM PERMITTING

FBV proposes an innovative and cost-effective treatment process to address high flows due to storm events, while reliably meeting ocean discharge limitations. Our solution is based on using disk filters to treat storm flows. The combination of disk filtration with an MBR system results in a state-of-the-art facility that improves treatment over the current WWTP from both an operational and effluent water quality perspective. The proposed FBV treatment process will address both dry- and wet-weather sanitary wastewater and stormwater flows in an economical fashion that is also protective of the environment, mitigates odors, and reduces overall energy costs, thus achieving many of the City's goals. We call this the Stormwater Adaptive Filtration Equipment (SAFE System).

The SAFE System is a well-established treatment solution for storm flows. Treatment facilities across the U.S. have been incorporating this technology to cost-effectively treat high flows while also protecting the environment and meeting regulatory requirements. The SAFE System is considered an enhanced high rate treatment (EHRT) system due to the pile cloth media filter. This cloth results in a filtered effluent that meets the secondary permit standards without using chemicals. **Figure 5.2** shows where EHRT treatment solutions are being used across the U.S.

One SAFE System has been successfully implemented and operational in California for Linda County Water District, California. The SAFE System has been successfully permitted in California for discharge to a sensitive body of water as the Linda County WWTP discharges into the Feather River which is a critical water supply for California and is aggressively monitored for water quality protections.

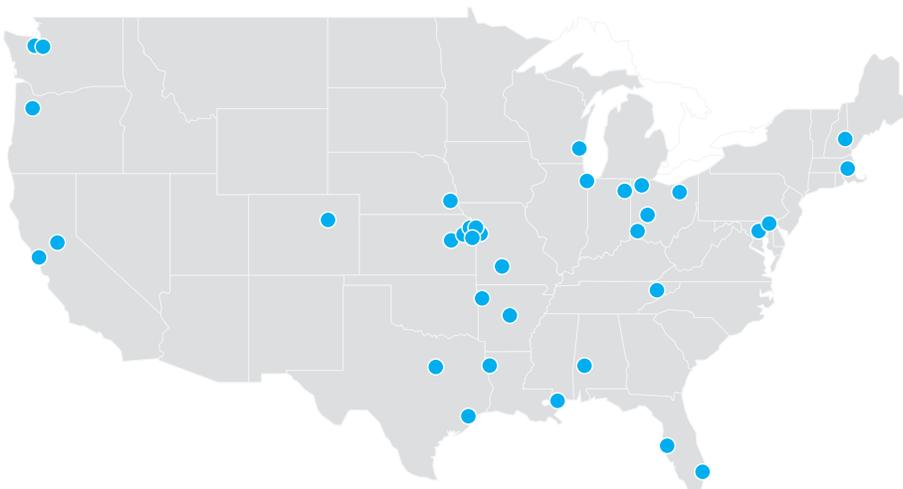

We recognize that a focused effort for permitting the SAFE System will be necessary to ensure a successful permitting process. Communication with the Regional Water Quality Control Board early in the process is a key component of our approach. The proposed FBV approach contemplates the NPDES permitting process by considering all elements of State and Federal regulation. We will provide a biological treatment process for nominal dry weather flows (governed by 40 CFR Part 133) and the SAFE System for high flows (governed by 40 CFR Part 122 which specifies auxiliary treatment). The combination of our biological treatment and the SAFE System will comply with numerical effluent limitations and criteria that are fully protective of the receiving water body. The SAFE System is intended to stabilize and ensure effectiveness of the biological treatment process while providing treatment for all sanitary wastewater and stormwater flows in a regulatory-compliant manner.

FBV will assist the City in obtaining a NPDES permit and associated approvals for the proposed treatment process in sequential fashion composed of two essential steps:

- 1) The preparation of a technical memorandum by our wastewater treatment and permitting expert **Dr. Michael Welch**. We will work closely with the City to achieve consensus on the specifics of this memorandum.
- 2) A stepwise consensus-building program based on the technical memorandum for all relevant project and permitting stakeholders.

The technical memorandum will demonstrate how the treatment process meets regulatory requirements, and will rely on FBV knowledge of treatment processes, water quality, and our National and Regional knowledge of facility permitting precedents and case-studies. This technical memorandum will form the basis of the Fact Sheet development and associated findings that support the NPDES permit.

Based on the technical memorandum, we will also prepare and conduct a step-wise series of presentations and briefings intended to build support and consensus for the proposed technical approach. The process will start with City and Regional Board staff, move on to local environmental groups, and conclude with Regional and State Board members and EPA staff. The goal of this process is to ensure that environmental, social, and affordability concerns are simultaneously met with an effective and reliable treatment plant that complies with all state and federal technology-based and water quality-based standards.

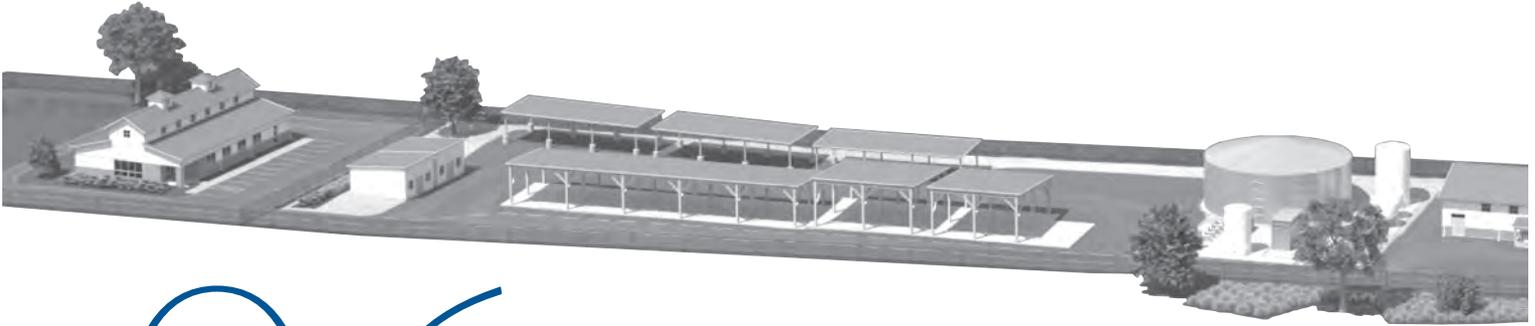

**FIGURE 5.2**  
Locations where  
EHRT has currently  
been permitted for  
treating high flows.

THIS PAGE IS INTENTIONALLY LEFT BLANK

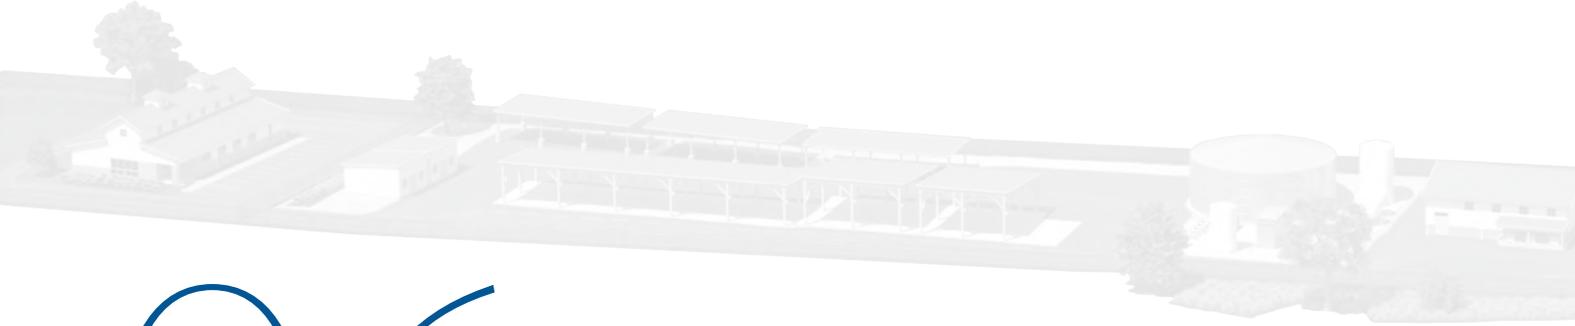

**TABLE 5.2: A PERMITTING MATRIX ENSURES NOTHING FALLS THROUGH THE CRACKS. THE BELOW PERMITTING MATRIX IS AN EXAMPLE FROM FBV'S RECENT PROJECT FOR PARKER WATER & SANITATION DISTRICT AND IS SIMILAR TO THE PROCESS WE WILL USE FOR MORRO BAY.**

| AGENCY  | TYPE OF PERMIT                              | AGENCY CONTACT                                               | PURPOSE/NEED                                                                                                                                                                       | SUBMITTAL REQUIREMENTS                                                                                                                                                                                                                                                                                                                 | TIMEFRAME                                                                                                                                                | ANTICIPATED FEE                                                            | RESPONSIBLE PARTY    | STATUS      | REMARKS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## PROJECT SEQUENCING AND SCHEDULING

# 06

## PROJECT SEQUENCING & SCHEDULING

The Filanc Black & Veatch design-build team will deliver the WRF efficiently by executing the work while considering permitting requirements and stakeholder interests. Our combined experience enables us to proactively identify and tackle schedule challenges.

The FBV team is comprised of veteran design-builders. We know how to deliver complex projects efficiently and effectively to avoid pitfalls that commonly lead to schedule delays. We will employ and integrate a variety of tactics to ensure a smooth DB experience for all stakeholders, including the following:

- Early design packages to support equipment procurement and permitting
- Continuous collaboration to define and maintain alignment for the life of the project
- Early negotiation of purchase orders and submittal processing to minimize the risk of equipment fabrication delays
- Parallel work activity and early start dates for activities focused on the critical path
- Use of breakout schedules, including 3-month and 3-week lookahead schedules, for planning work
- Proactive development of workplans for definable features of work to ensure the proper labor and materials are ready to go
- Proactive development and implementation of startup plans
- Early and regular interaction with regulatory agencies to facilitate timely permitting

Our proposed Primavera P6 schedule is provided in Appendix 3. **Figure 6.1** on the following page is a summary schedule highlighting major milestones. As shown, we have a plan to reach final contractual completion, plus the required 6-month post-commissioning phase, before the end of 2021. The City will benefit from this 3- to 6-month acceleration through cost savings from a shorter construction duration, sooner beneficial occupancy, and timely permit compliance. This plan is possible due to our efficient approach to executing work and is based on assumptions identified in **Table 6.1**.

Our approach comfortably achieves a 3- to 6-month early completion.

### APPROACH TO DESIGN SEQUENCING

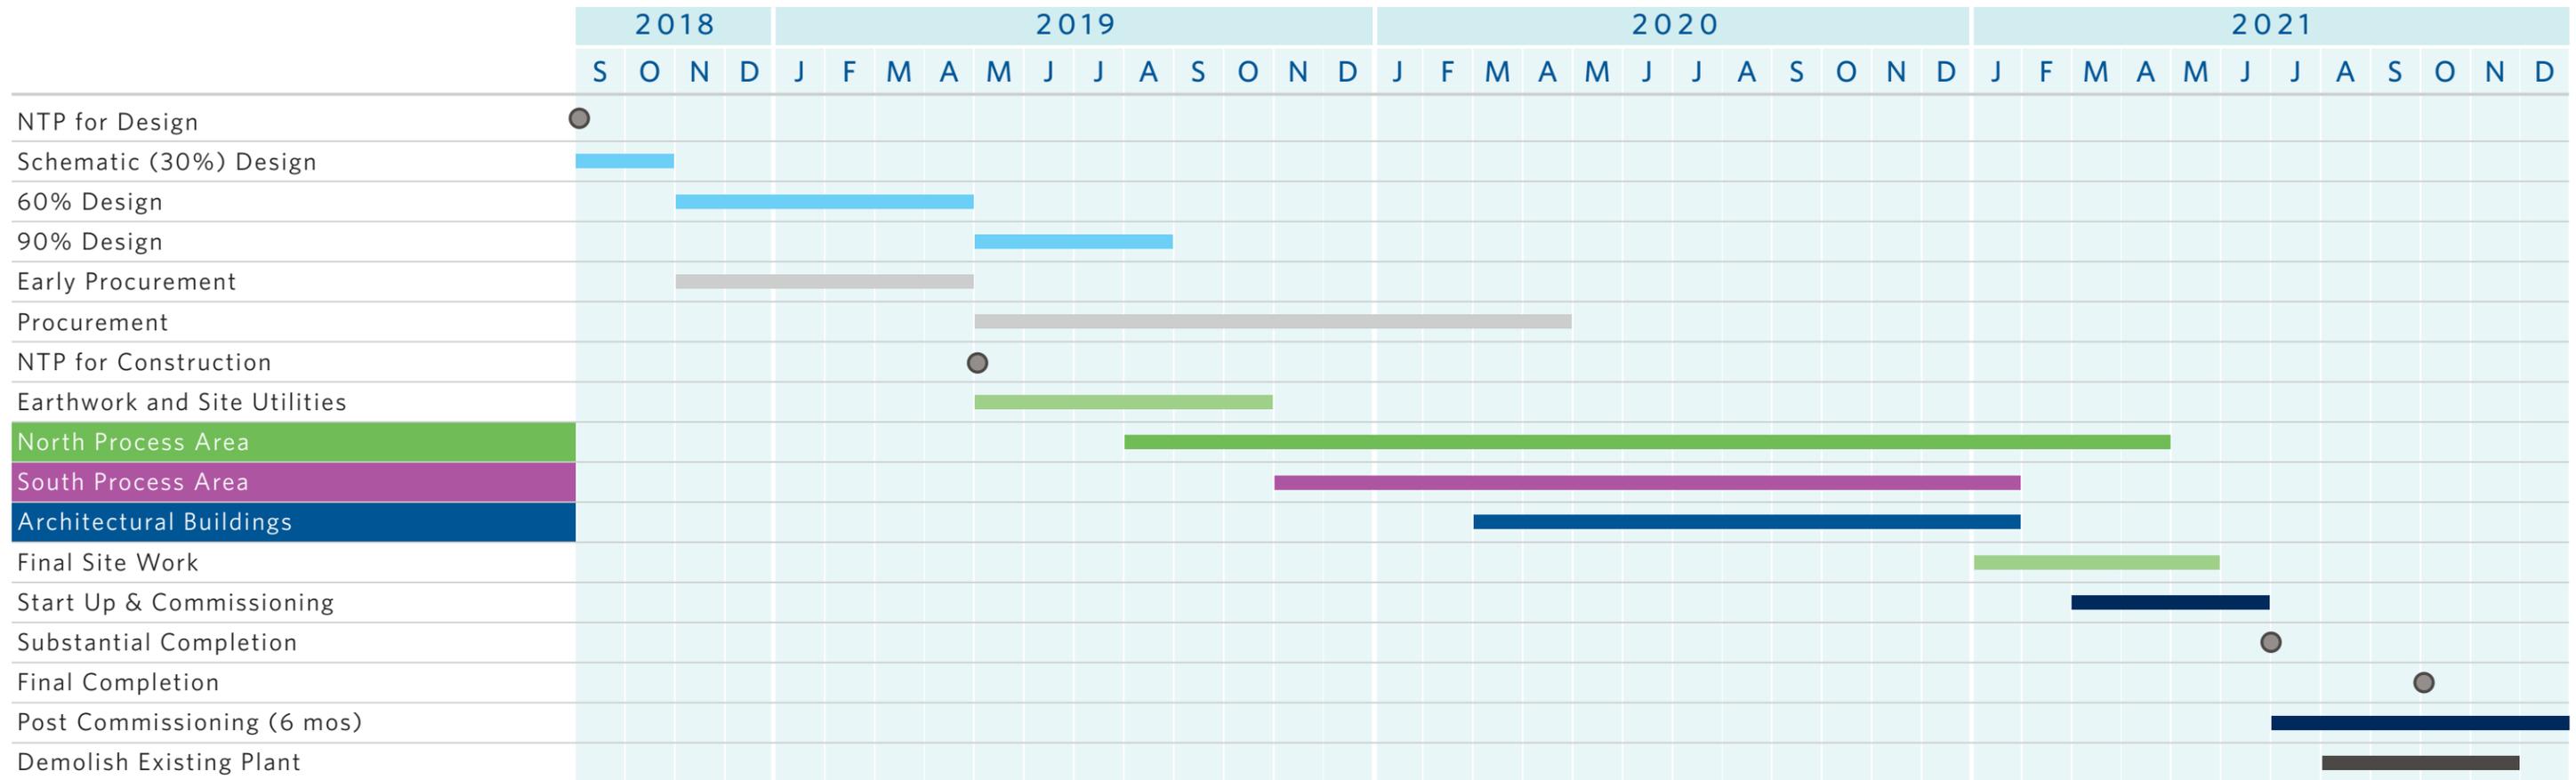

Following NTP, we will begin with a Schematic Design as called for in the Proposal DB Agreement. This will be a Basis of Design Report detailing design criteria for each building and process component and includes drawings at a nominal 30% completion level for all disciplines. This period, anticipated to last two months, will be highly collaborative, taking full advantage of the DB process. It will be the first opportunity for our team to interact with yours to refine and reach consensus on the technical approach defined in this proposal. We anticipate multiple face-to-face meetings and workshops to gel our collective ideas. At the conclusion of this phase, it is important for project efficiency that we move forward as one team in pursuit of a common vision.

The Schematic Design process will focus particularly on decision making and design details associated with the MBR, the core of the treatment process and a critical path item, enabling us to quickly go to market to select the MBR equipment vendor. This is important because MBR equipment from alternative manufacturers differs significantly in size and orientation. Making an early selection enables submittal information to be used as a basis of the design of the BNR/MBR structure, saving time and costly rework.

Another early task keyed off the Schematic Design milestone is development of an earthwork design that can be used as part of a grading permit application. Timely receipt of the grading permit is critical to initiate work immediately after construction NTP. Included in the grading permit package will be plans for erosion control, vegetation and landscaping, and dust control. The latter may also require a permit from the Air Pollution Control Board for control of asbestos fibers that naturally occur in serpentinite rock on the southern end of the site. We will also prepare a Storm Water Pollution Prevention Plan (SWPPP) prior to construction.

The next set of priorities in design development is to engage with the market for other major equipment, including the RO, UV, headworks, dewatering equipment and auxiliary filters. This will be useful for locking in pricing to manage escalation risk and to prevent delays in fabrication and delivery of critical components. Once we have competitively selected each vendor, we will begin to negotiate terms and conditions, often a protracted, time-consuming process, enabling early execution of purchase orders (POs). We will employ a strategy to structure the POs conditionally, with initial authorization to produce submittals only (and associated payment upon receipt, if required). Receiving and approving critical submittals early allows us to provide adequate time for fabrication and manage timing of deliveries to suit the schedule and avoid delays.

**FIGURE 6.1: SUMMARY SCHEDULE WITH MAJOR MILESTONES**

**TABLE 6.1: SCHEDULE ASSUMPTIONS**

- |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ol style="list-style-type: none"> <li>1 There will be no more than two Notices to Proceed (NTP).</li> <li>2 The first NTP will be on or about September 4, 2018, and will allow design, preconstruction services and some early procurement.</li> <li>3 The second NTP, based on the City’s receipt of funding, will be for construction on or about April 29, 2019. We will not mobilize to the site before this NTP.</li> <li>4 Design submittals will include a Schematic Design (30 percent), 60 percent design, 90 percent design and as-built drawings.</li> <li>5 Construction can commence after receipt of the second NTP, a grading permit, and approval of design for early construction activities.</li> <li>6 The 6-month post-commissioning phase starts after Substantial Completion.</li> <li>7 Final Completion and demolition of the existing treatment plant occurs during the 6-month post-commissioning phase.</li> <li>8 The City of Morro Bay, rather than SLO County, will be the permitting authority for local permits, such as the grading and building permits.</li> </ol> | <ol style="list-style-type: none"> <li>9 The anticipated environmental mitigation measures do not restrict year-round construction activity; however, some biological monitoring will be required during certain seasons.</li> <li>10 Design progress meetings will be held biweekly in City offices.</li> <li>11 Construction meetings will be held weekly in on-site project field offices.</li> <li>12 The Engineer of Record on the DB Team will review and approve all material submittals.</li> <li>13 The City will provide review comments to the Schematic Design 2 weeks after submittal and to the 60% and 90% designs 3 weeks after submittal.</li> <li>14 The City will review and approve a preidentified subset of submittals, and those reviews will occur concurrently with the DB Team’s review.</li> <li>15 During startup, the City will provide activated sludge to seed the new biological treatment facility. Water produced during this phase can be discharged to the ocean outfall.</li> </ol> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Completion of the 60% design package is targeted to coincide with construction NTP, or eight months after initial NTP. The 60% package will be sufficiently complete to enable immediate mobilization for early construction activities. This will primarily be mass grading work, lasting about three months, followed by major backbone yard piping and electrical duct banks, structural excavation and foundations for the BNR/MBR and Aerobic Digester facilities.

Getting design off the critical path as soon as possible is one of our DB best practices. It aids construction sequencing and avoids trade stacking.

Our goal is for enough construction to be released from the 60% package that design is no longer on the critical path. The subsequent 90% design, essentially a complete package short of final City comments, will be finished about four months after 60% design milestone, or about one year from initial NTP. We assume a final design submittal is not necessary. Rather, a comprehensive set of as-built drawings will be issued following substantial completion to serve as the ultimate design record.

During the initial eight-month design period, we will establish a biweekly progress meeting that will be held regularly, or as mutually agreed. Additional in-depth design workshops or major submittal reviews will be scheduled, as needed. As discussed in Section 4, it is our belief and experience that frequent in-person collaborative team interaction early in the process is vital to overall project success. It prevents misunderstanding and rework.

## APPROACH TO CONSTRUCTION SEQUENCING

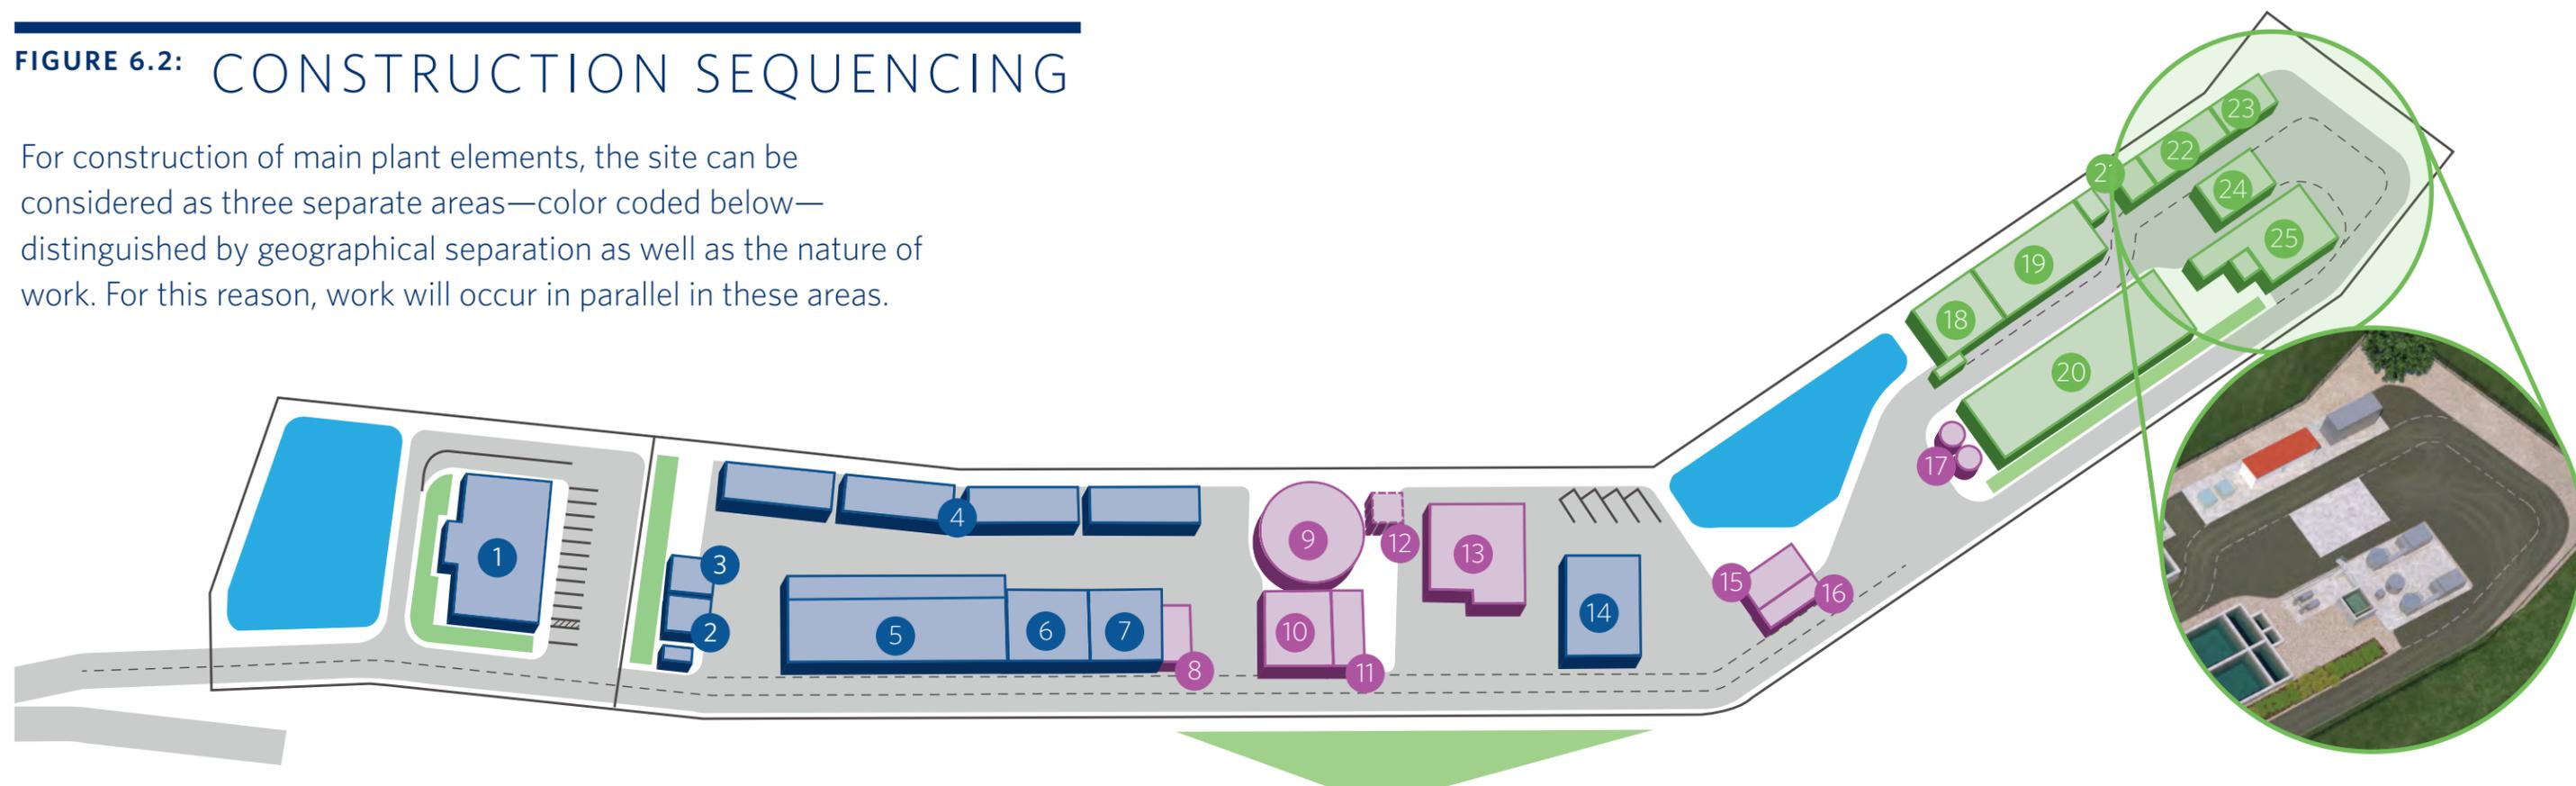

Our approach to sequencing construction is to focus on critical path activities while sub-critical work is executed in parallel. As graphically represented in **Figure 6.2** on the following page, the site is oriented to enable simultaneous work in separate areas without interference. Sitewide clearing and grubbing will occur first followed by mass grading, taking about three months to transform the site topography for the design hydraulic grade. While it will require substantial cuts and fills, our approach is engineered to be a balanced site, saving cost and time.

Next, the backbone yard piping on the eastern edge of the site, the duct backs on the western edge of the site, and major deep cross drains will be constructed. These will be initially installed only in the south  $\frac{3}{4}$  of the site, as the northern section will involve deep excavations that will not permit early utility work.

We will conduct a weekly on-site construction meeting with the City and its representatives. This meeting will have a standard agenda, including review of the three-week lookahead schedule, present pay applications, resolve field issues and concerns, and discuss other matters of routine business to promote effective communication and coordination in the field. In addition, we anticipate the need for periodic (as-needed, but perhaps monthly) higher-level management meetings to discuss big picture scope, schedule, or contractual matters.

## FIGURE 6.2: CONSTRUCTION SEQUENCING

For construction of main plant elements, the site can be considered as three separate areas—color coded below—distinguished by geographical separation as well as the nature of work. For this reason, work will occur in parallel in these areas.

### ARCHITECTURAL STRUCTURES

- 1 Operations Building
- 2 Water Supply Storage
- 3 Collection Supply Storage
- 4 Outdoor Storage Aisles
- 5 WRF Parking Canopy
- 6 Water Vehicles Equipment Storage
- 7 Collection Vehicles Equipment Storage
- 14 Maintenance Building

### SOUTH PROCESS AREA

- 8 Wash Rack
- 9 Recycled Water Tank
- 10 Effluent Pump Area
- 11 SAFE System
- 12 Calcite Remineralization
- 13 RO/UV Building
- 15 Chemical Area
- 16 Chemical Unloading
- 17 RO Feed Tanks

Slab on-grade mechanical installations, including the RO/UV building, SAFE System/Effluent Pumping facility, Effluent Storage tank and Chemical Unloading facility. The RO/UV building will be built first to be available when equipment is ready for delivery. Mechanical work in the RO/UV building will require intensive effort to assemble, set, plumb, wire and program equipment.

### NORTH PROCESS AREA

- 18 Dewatering Area
- 19 Aerobic Digester
- 20 Membrane Bioreactor (MBR)
- 21 Incoming Utility Transformers
- 22 Electrical Room
- 23 Emergency Generator
- 24 Vector Receiving Station/Washdown
- 25 Headworks Area

BNR/MBR and Aerobic Digester are deep, cast-in-place concrete structures requiring extensive excavation, subgrade preparation and concrete work. Construction of this area is at the core of the critical path. We will begin work as soon as mass grading in this area is complete. Crews will be dedicated to this area until complete, anticipated to be approximately 21 months. We will begin construction of the BNR/MBR structure first, which will require an excavation over 20 feet deep.

Once the floor slab is placed, excavation will continue for adjacent, and nearly as deep, Aerobic Digester. After placing walls and backfilling area, work will shift to subgrade preparation and on-grade slabs for headworks, electrical and dewatering facilities. As equipment is delivered, it will be installed in their respective locations and piping and conduit will be run to each.

## THE FILANC BLACK & VEATCH DIFFERENCE

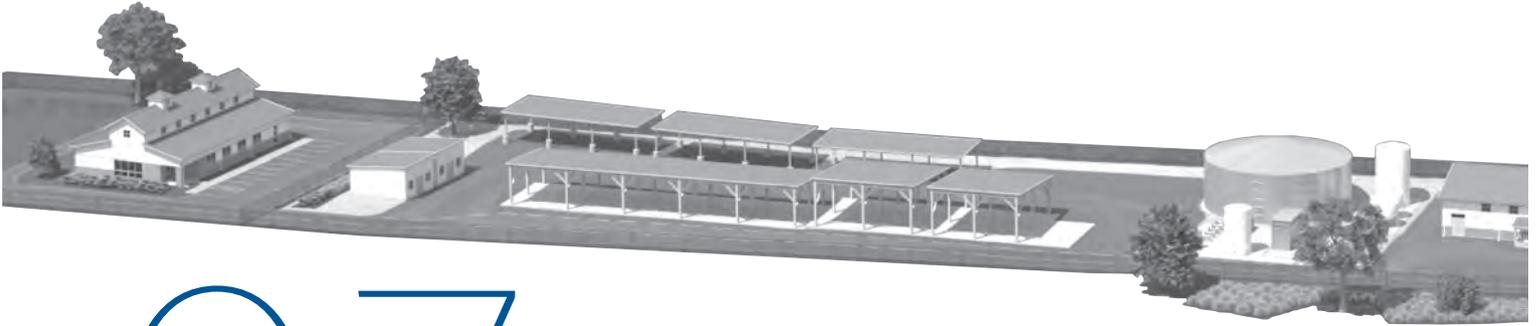

The WRF project will benefit from our team’s employment of a dedicated scheduler. **Marsha Peterson**, who provides fully-dimensioned scheduling services for Filanc, will support our team by producing and updating the schedule so it can be relied on as an effective management tool. Marsha is a recognized expert in multiple CPM scheduling platforms, including Primavera P6, and she teaches classes in CPM scheduling at UCLA. As part of the schedule update process, Marsha provides a “reality check” to verify the updated model reflects the reality of the project. When reality deviates from the plan, she is adept at facilitating re-planning the project or analyzing time impacts to demonstrate those deviations.

As further benefit to the City, our team will inherently be able to reduce schedule risk to the project because we are a self-performing general contractor. Including exclusive electrical contractor **Big Sky**, we can self-perform nearly 80% of the construction scope. By self-performing, it is much easier to manage and control the critical path. We are more able to be flexible with directing crews to tackle work as daily field situations dictate. Also, if a subcontractor fails to perform for any reason, we will likely be able to step in and continue that work without undue schedule impact.

The FBV team will be able to reduce schedule risk to the WRF project because we are a self-performing general contractor.

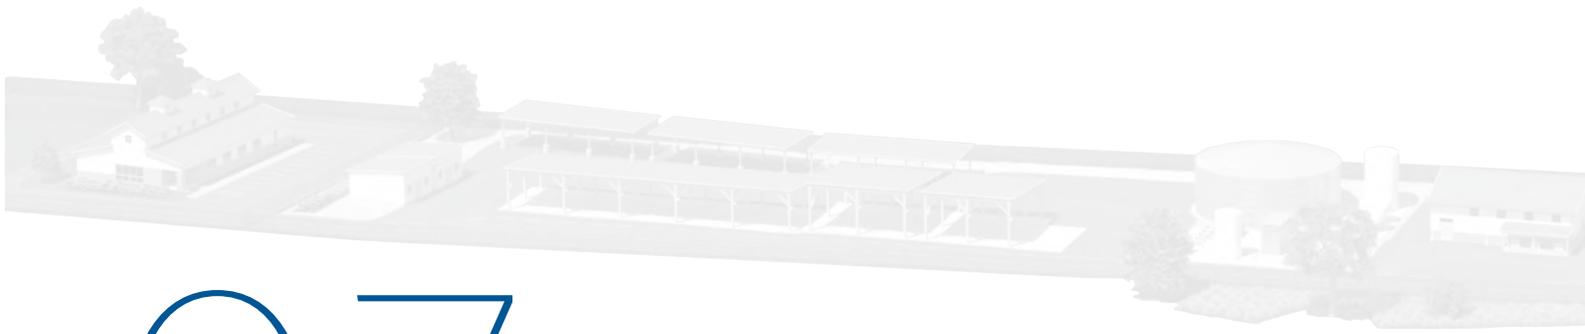

Lastly, the City of Morro Bay will significantly benefit from the work Filanc is currently doing as the Construction Manager at Risk (CMAR) for the Cayucos Sanitary District. The Cayucos project schedule is ahead of the Morro Bay schedule. Therefore, we are gaining valuable knowledge about local resources and skilled labor availability. As work proceeds, we will know even more about who can really perform and whether we would want to bring them to your project. Timing-wise, crews could move seamlessly from one project to the other. As both projects are wastewater treatment facilities, we will have a strong data base of equipment vendor offerings and pricing.

# PROPOSED DESIGN

# 07

## PROPOSED DESIGN

FBV's unmatched experience results in a new WRF for Morro Bay with NO COMPROMISES that:

- ✓ Minimizes Capital Cost
- ✓ Achieves Regulatory Compliance
- ✓ Facilitates Potable Reuse
- ✓ Maximizes Energy Efficiency
- ✓ Minimizes O&M Cost and Complexity
- ✓ Provides Reliability
- ✓ Expedites Schedule
- ✓ Delivers Quality

The City of Morro Bay's RFP did an excellent job of defining the critical process and performance requirements for your new WRF. In this section of our proposal, we present our proposed design to cost-effectively incorporate those requirements into a treatment facility your staff will be proud to own and operate. We look forward to the opportunity to work collaboratively with you to perfect that design and build the plant that you envision.

To prepare our proposal, we brought together our team of water reclamation facility design, construction, procurement, and operations and maintenance experts to develop a proposed design that delivers your objectives.

Our proposed design results from a collaborative approach within our team and with your staff. Our team's efforts included numerous in-person design charrettes, focus meetings, and coordination efforts to brainstorm concepts, vet ideas, and gel approaches—the same approach we will use to develop the final design with you. Our proposed design also benefited greatly from our proprietary meetings with you—by giving us additional input to help us refine our efforts and by allowing us to make sure it is in keeping with your goals and desires.

We also conducted field work at the South Bay Boulevard site to help confirm assumptions needed to optimize our grading plan and reduce construction risks.

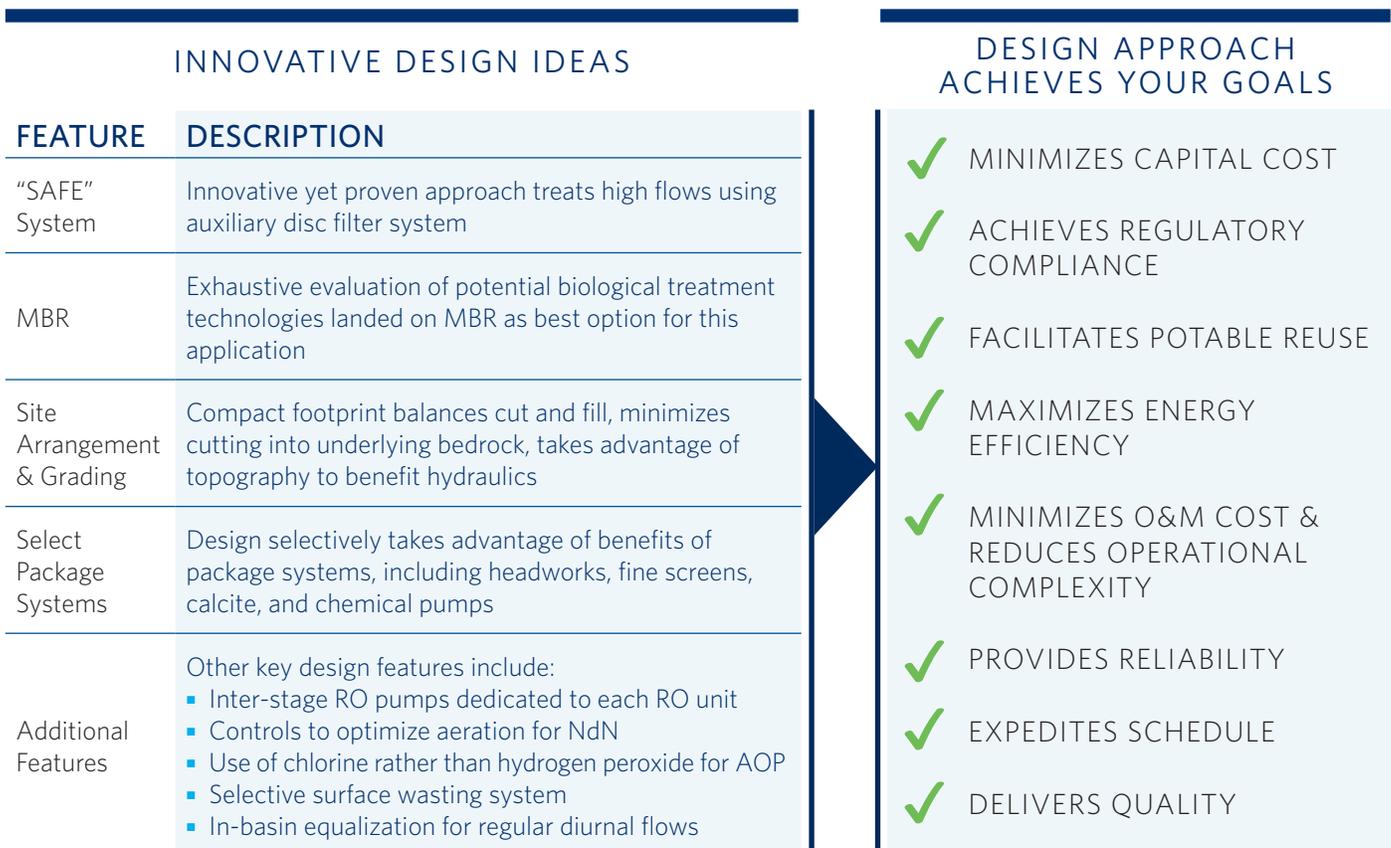

The rigorous approach we followed to develop our proposed design resulted in the preparation of nearly 100 engineering drawings that provide a basis for the guaranteed maximum price (GMP) and life cycle costs we present in our Cost Proposal. These drawings are presented in Appendix 6 and the detailed life cycle cost analysis is shown in Appendix 5..

As a supplement to the drawings, we also completed the 14 proposal forms from Attachment E of the RFP. We augmented these with six additional forms to document our designs for Electrical, Instrumentation & Control, Civil/Site, Structural, Architectural, and Post-Treatment. All of these forms are provided at the end of this Section 7.

### 7.1 KEY BENEFITS OF FBV’S PROPOSED DESIGN

During development of our proposed design, our focus was on creating a design that most cost-effectively meets your project objectives, moving the City toward water independence in concert with replacing your aging infrastructure. We took full advantage of the collective water reclamation facility design, construction, procurement, and operation and maintenance expertise of our team to develop a design that delivers on your vision with No Compromises to cost performance, quality, reliability, durability, or operations friendliness. **Figure 7.1** below provides a summary of some of the innovative approaches of our proposed design.

**FIGURE 7.1: SUMMARY OF INNOVATIVE IDEAS & KEY BENEFITS OF THE FBV PROPOSED DESIGN**

The discussions that follow in this section of our proposal complement the design described and illustrated in the forms and drawings by highlighting the key features and benefits of our proposed design solutions.

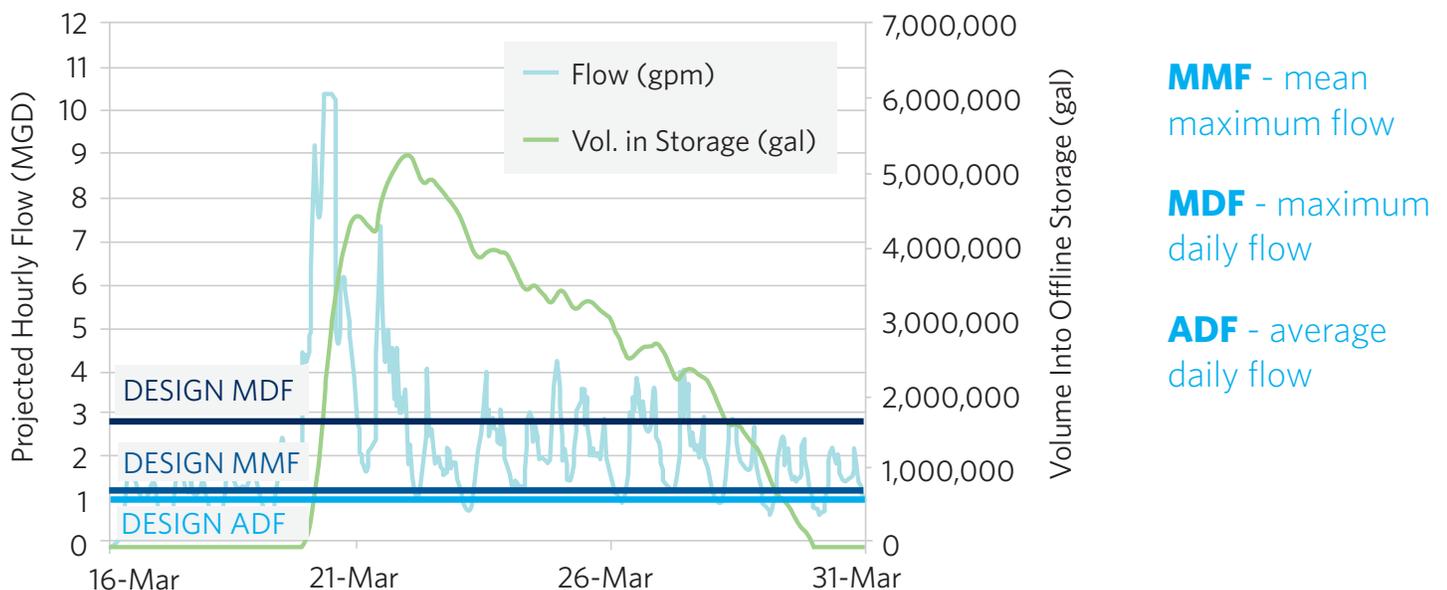

## 7.2. FLOWS & LOADS

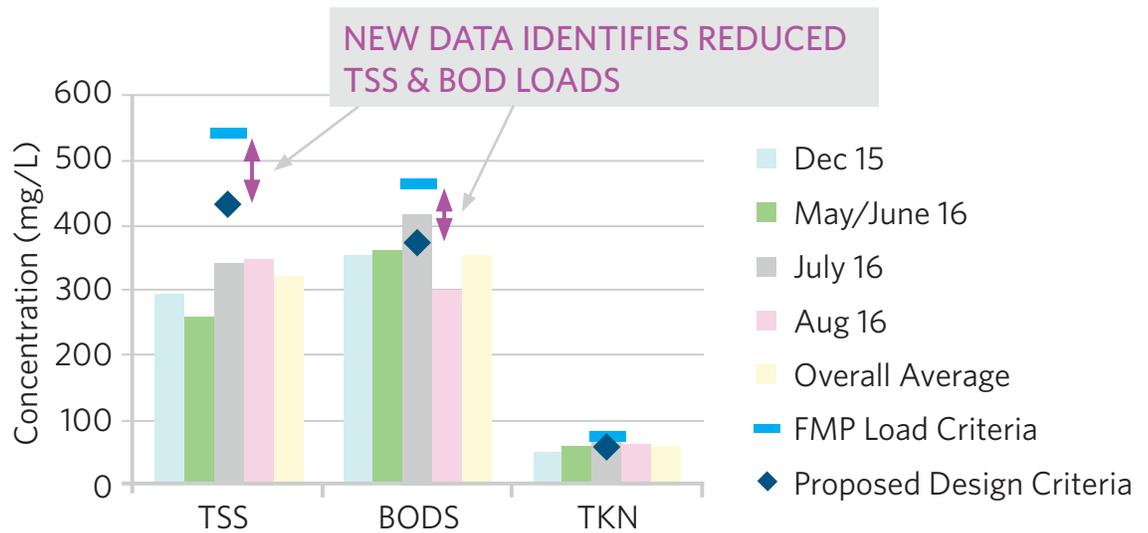

As we learned from our analysis of 20 years of flow data in the Facility Master Plan (FMP), the City periodically experiences extremely high peak flows. The cost and complexity of the WRF will be driven by the design solution to manage these peak flows that your new plant will have to handle. **Figure 7.2** below presents an example of flow data from a representative time period.

In the FMP, and as reflected in your RFP, the proposed solution to this was to provide a large influent flow equalization basin to manage the flows. This was a good planning level approach that provided a conservative process design, plant footprint for space planning, and overall project cost for budgeting.

The FMP also provided an analysis of water quality constituent loads to provide planning level values for TSS, BOD, TKN, and others. This yielded a conservative treatment process conceptual design for space planning and cost estimating. The FMP went on to recommend that the City perform additional sampling. The results of that sampling were provided to us with the RFP.

**FIGURE 7.2: EXAMPLE OF MORRO BAY PEAK FLOW DATA & ANALYSIS OF FLOW EQUALIZATION STORAGE NEED**

**FIGURE 7.3: REFINEMENT OF LOAD DATA**

With new data available, FBV analyzed the new load information and revisited the high flows and water quality requirements, all to identify opportunities to refine our design approach.

**Figure 7.3** above shows an analysis of the new load data alongside the preliminary criteria from the RFP. As shown, the new data supports significantly lower load criteria for TSS and BOD. This affords a significant opportunity to refine the design to reduce sizing of treatment unit processes and optimize both your capital and O&M costs

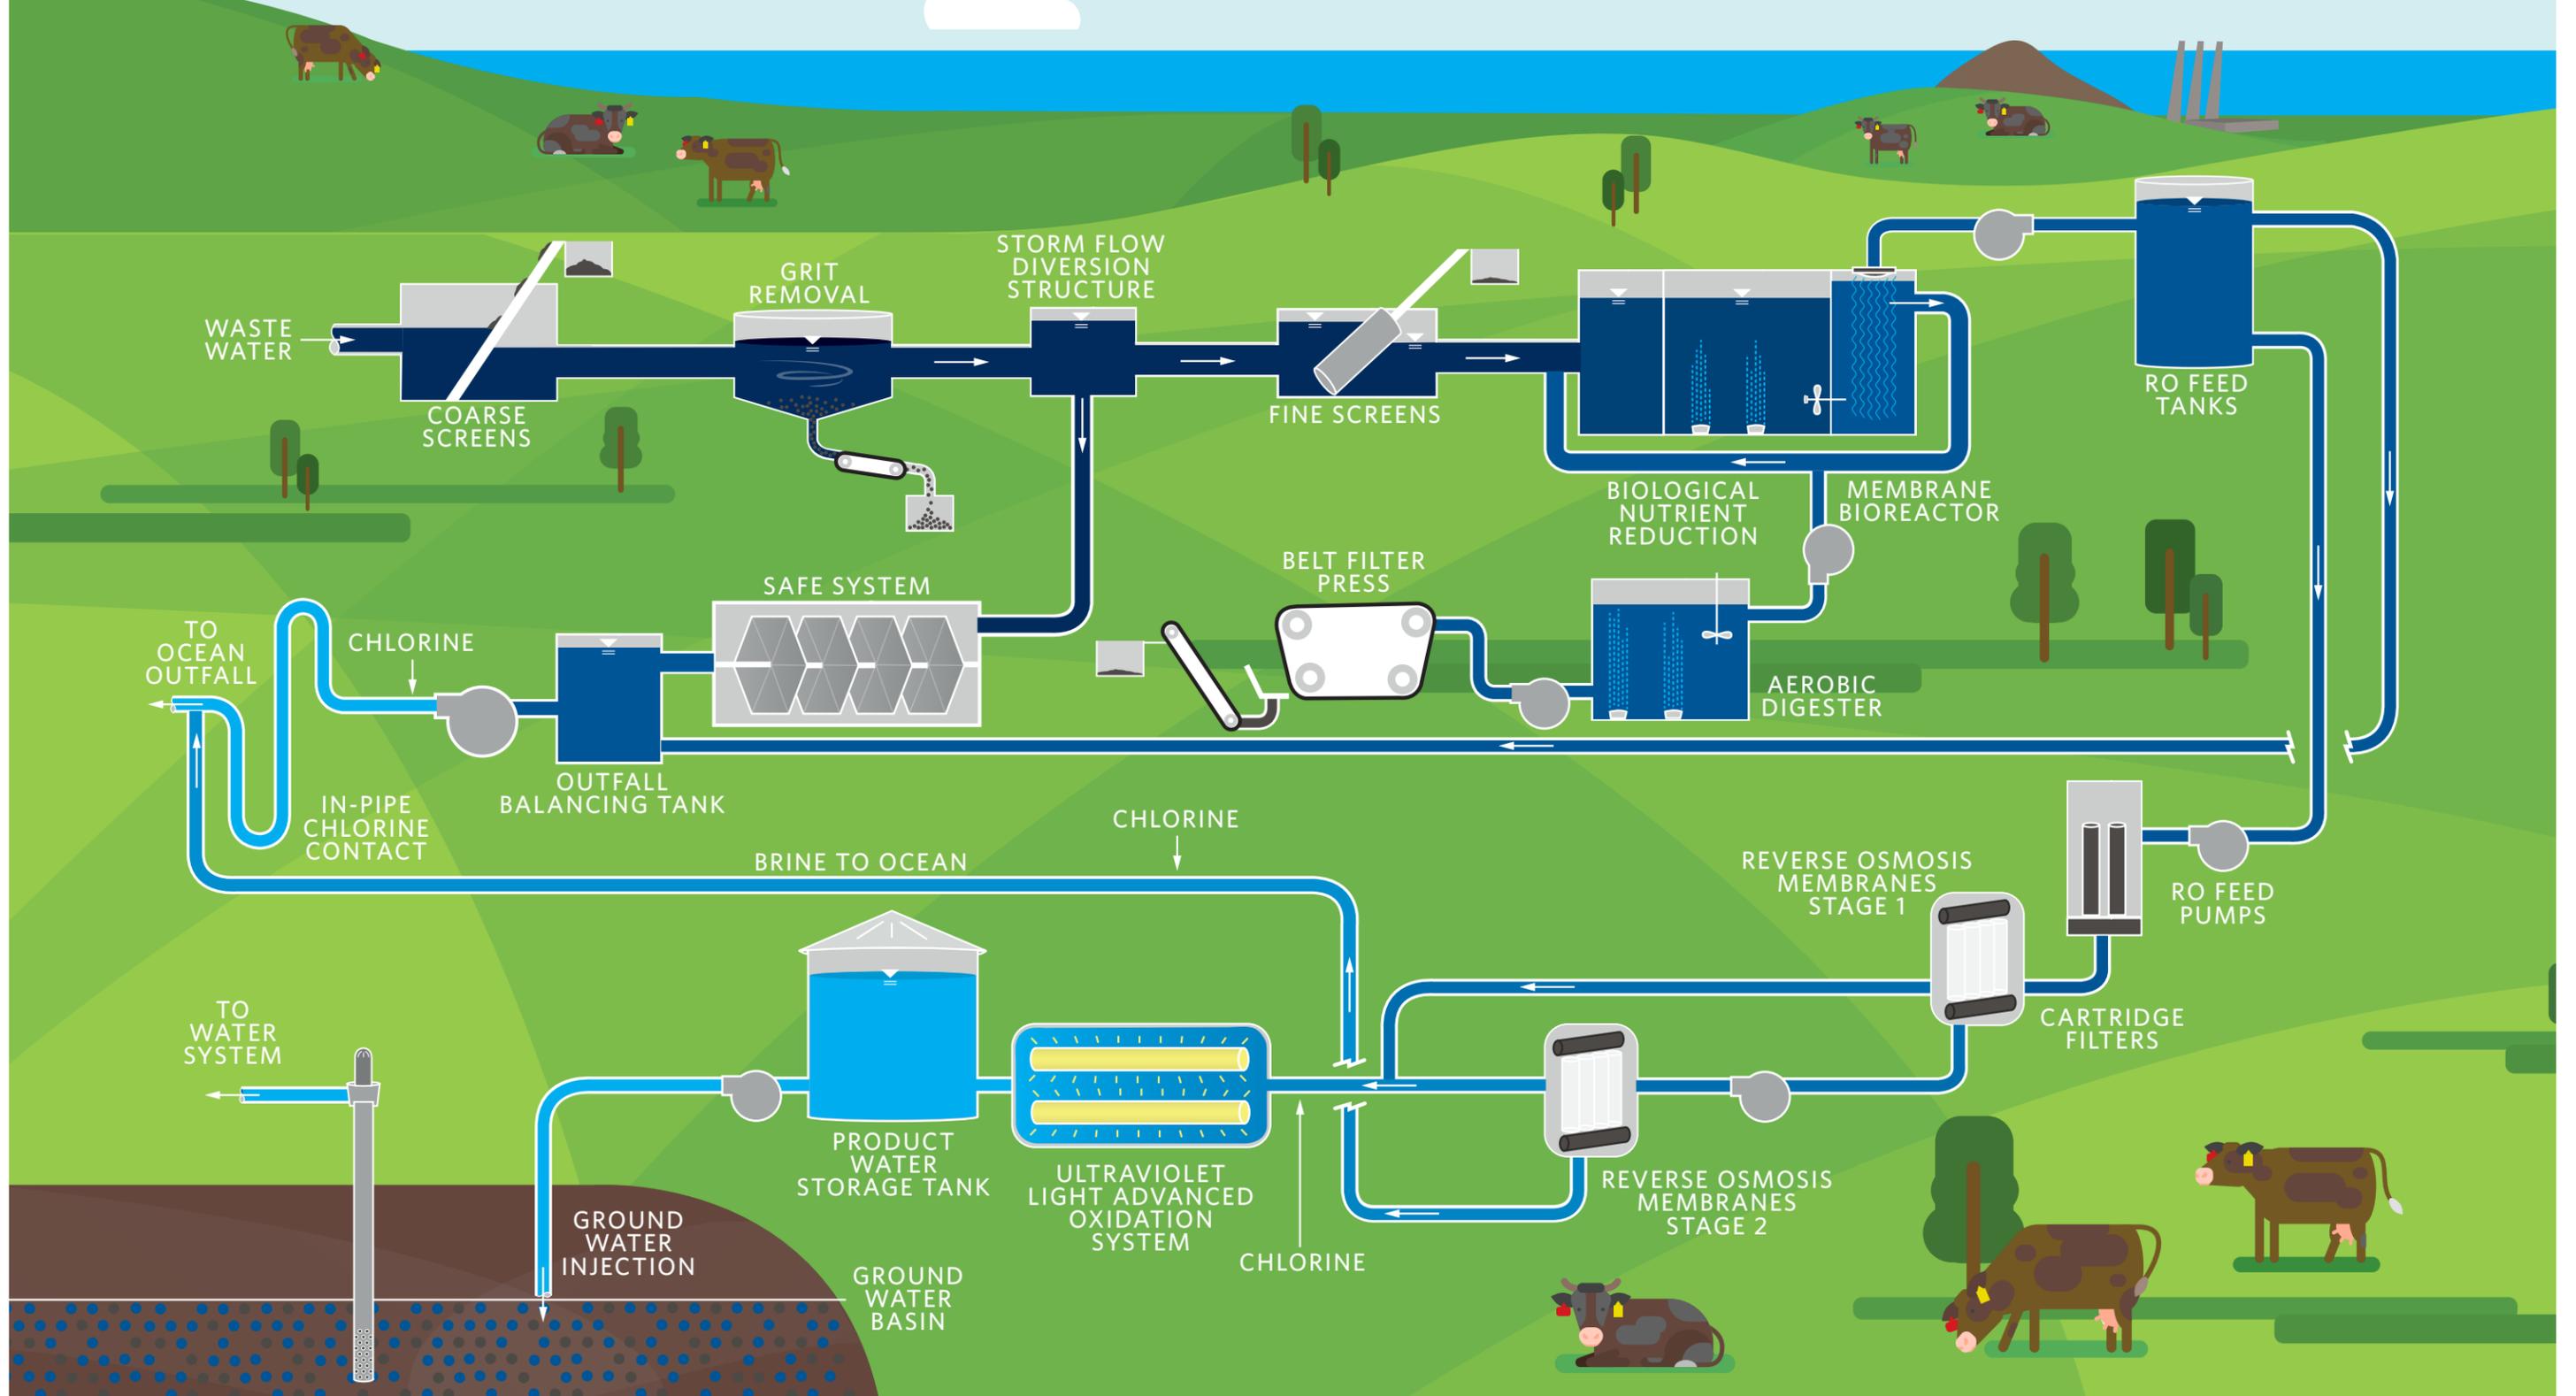

### Refined water quality data results in reduced process sizing, reduced capital and O&M cost

#### PROPOSED TREATMENT PROCESS SOLUTION - OVERVIEW

Morro Bay's new WRF must meet dual water quality objectives. First, it must provide a consistent and high quality advanced water treatment (AWT) for groundwater injection and indirect potable reuse. Second, when discharging to the ocean, the WRF must meet strict effluent discharge limits established by its NPDES permit.

To develop our proposal, the FBV team of experts took the opportunity to evaluate every aspect of the project to achieve an overarching goal: to meet these objectives in a cost-effective manner, while providing a durable, easy to operate and maintain facility. Our refinement of the influent water quality analysis, described in the prior section, will contribute to achieving that goal. Resulting from our efforts and our collaborative proprietary discussions with you, our proposed design is founded on the treatment process solution shown in **Figure 7.4** on the following page, and Drawing 00-G-003 in Appendix 6. The associated hydraulic profile is also included as Drawing 00-G-004.

FIGURE 7.4: PROCESS FLOW DIAGRAM

The biological treatment process, the central component of the WRF, is highlighted by the following beneficial features:

### BNR-MBR

Our team analyzed a comprehensive set of alternatives and vendors from a performance and cost perspective. We selected Biological Nutrient Removal (BNR) with Membrane Bioreactors (MBRs) as the appropriate core treatment technology for Morro Bay. We arrived at this approach because MBRs provide a range of benefits:

- Provides flexibility to meet diverse effluent water quality requirements
- Provides filtration ahead of reverse osmosis (RO) reducing complexity and O&M needs by eliminating an additional unit process
- Has more compact footprint overall
- Provides least life-cycle cost (capital & O&M)

### AUXILIARY FILTRATION - "SAFE" SYSTEM

To optimize the WRF while meeting your water quality objectives, we are proposing an innovative approach that addresses the issue of high flows described earlier. We will provide an auxiliary filtration system we are calling the Stormwater Adaptive Filtration Equipment, or "SAFE" System. The SAFE System provide a number benefits:

**Innovative SAFE System approach reduces BNR-MBR by 30%, saving capital and O&M cost**

- Reduces cost, space, and operations and maintenance complexity associated with a large flow equalization basin.
- Allows size of BNR-MBR to be reduced by 30%, greatly reducing construction and operational costs
- Protects compliance with permit requirements
- Meets regulatory requirements for secondary treatment standards without using chemicals

Details about our design approach to these and the other WRF unit processes are presented through the remainder of this section of our proposal.

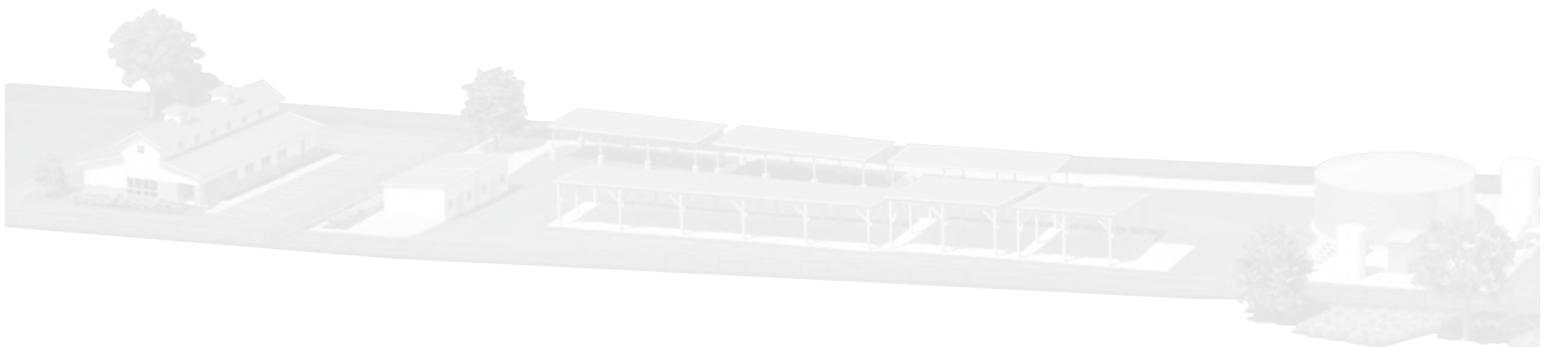

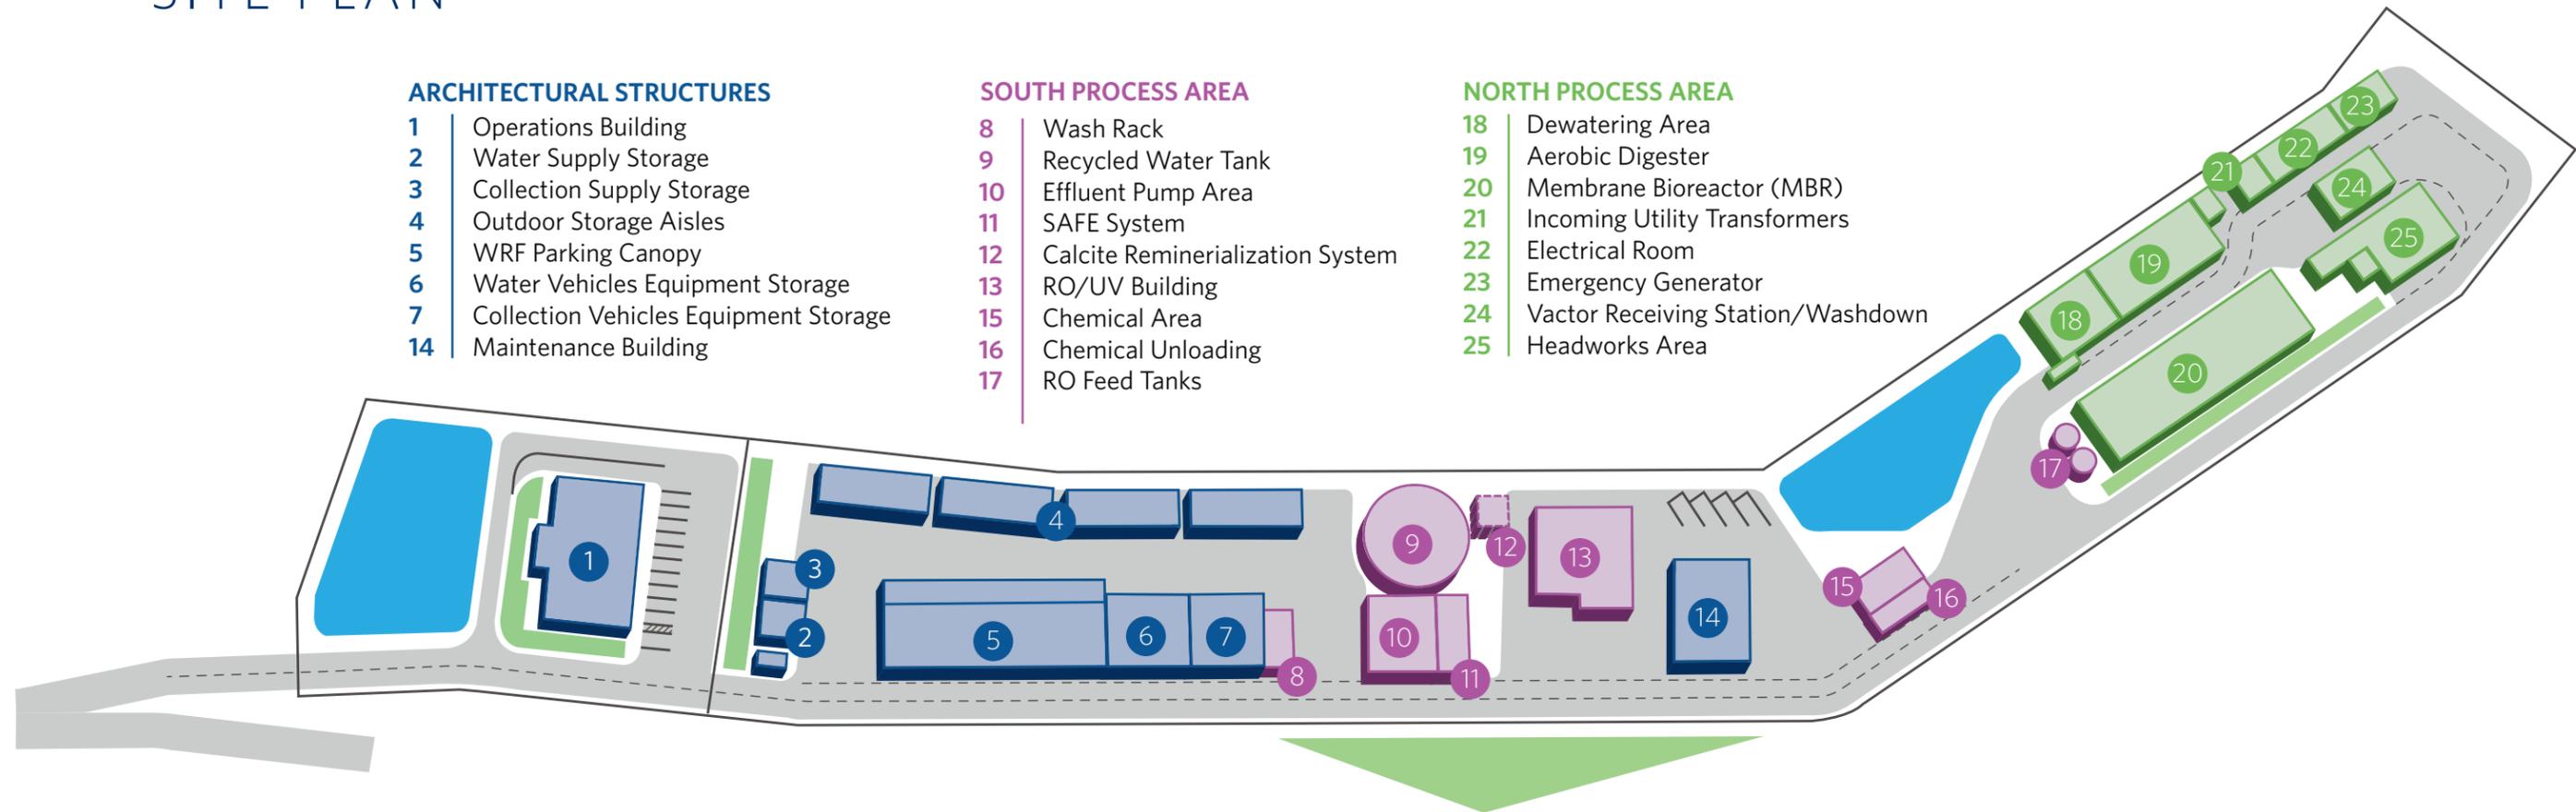

FIGURE 7.4: SITE PLAN

7.4 SITE PLAN

The South Bay Boulevard (SBB) site provides a blank slate for the new WRF. To develop a grading and site plan for the project, our team focused on several goals:

- Minimize construction cost
- Provide expeditious construction schedule
- Provide hydraulically advantageous profile by minimizing elevation of the headworks and minimizing pumping between processes
- Incorporate 60-foot wide utility easement
- Provide unconstrained access to all areas of the site to enhance O&M activities
- Position key process elements in close proximity to one another to facilitate O&M
- Incorporate drainage BMPs to address stormwater regulations

Figure 7.4 provides an overview of our Proposed Design, depicting overall site grading and the arrangement of the facilities on the site. Additional detail is provided in the drawings in Appendix 6. Grading plans and sections are provided on Drawings 10-C-102 and 10-C-301. Drawings 10-C-101, and 13-C-101 though 103 provide details about the facilities arrangement, as well as process piping, site utilities, and electrical power supply.

GRADING

One of the key challenges of the SBB site is the topography. Developing the site plan required careful balancing to cost-effectively provide a site that has good access to all areas of the plant, places key process elements in close proximity to one another, is conducive to plant hydraulics, minimizes expensive import or export of materials, and minimizes the extent of retaining walls.

Our Proposed Design does all of this and provides a best-value to the City by:

- Minimizing Site Footprint. To do this, we spent considerable effort to optimize the arrangement of the various facilities and individual building footprints. We provided access roads and space for operations and maintenance activities but made efficient use of space. Within evaluation of the treatment process, we evaluated how each unit process and how the process train as a whole would impact site development costs, and vice versa.
- Geotechnical Evaluation. Our experts carefully reviewed the RFP and Yeh & Associates geotechnical report provided along with the RFP. The site is comprised of surficial materials, including unsuitable expansive clays, underlain by bedrock materials. The Yeh & Associates report recommended 2H:1V slopes for both excavation and compacted backfill slopes. We performed our own field reconnaissance by digging test pits under supervision from another local geotechnical engineer to confirm the findings. For our Proposed Design, we have elected to employ the Yeh & Associates recommendations in lieu of the 3H:1V mentioned in the RFP performance criteria, as it saves significant cost to the project.

## Compact site provides best value with:

- **Balanced cut/fill**
- **Minimal retaining walls**
- **Beneficial hydraulics**

- Balancing Cut and Fill. Our proposed design balances the excavated bedrock volume (excluding the unsuitable surficial expansive clays) with compacted backfill volume to reduce the need for import of structural backfill. To achieve an economical grading plan and facilitate an effective hydraulic profile, the site is long and narrow, generally following the adjacent creek alignment, and inclusive of the environmental buffer to the creek and the 60-foot wide utility access easement. Minimizing the width of the site perpendicular to the existing hillside slopes minimized required cut and fill volumes. Excavation is predominantly on the southern half of the site, compacted fill for most of the northern half of the site, with a small area of excavation again at the far northern end. The grade runs downhill from north to south, as it generally does in its existing condition, minimizing grading and providing fall between treatment processes to minimize pumping. Excavated bedrock will be processed on site to the extent possible and only the shortfall of material, if any, will be made up with imported material. Excess spoils will be spread on site west of the WRF facility, such as in the draw uphill of the northern end of the plant site, or on the southern face of the hill south of there.
- Minimizing Retaining Walls. The proposed design largely eliminated the need for retaining walls on the project. A couple of short walls are included to accommodate transition slopes, but these are limited in extent.

## SITE PLAN FEATURE SUMMARY

By implementing the aforementioned approach, we were able to minimize the cost of the grading and site work for the WRF as well as minimize operational and maintenance costs for the WRF. The resulting site plan in **Figure 7.4** offers other valuable features worth noting.

- The southern end of the site includes a 24-foot wide access road that will accommodate two-way traffic. To the north, the road becomes a one-way counterclockwise loop to provide good vehicular access and O&M work space while minimizing additional grading cost. Access roads provide WB-50 sized truck maneuverability.
- Roads (asphalt) and parking (concrete) areas will be paved.
- Areas are provided for landscaping for visual screening and aesthetic appeal.
- The access road along the eastern side of the site will serve as corridor for wet utilities (recycled water and plant effluent lines, chemical duct bank, RO concentrate disposal). The access road on the western side of the site will accommodate major electrical duct banks. This arrangement enhances constructability and ability to route piping and ducts efficiently to where they are needed. Potable water and fire water loops run the full perimeter of the site.
- The operations building is placed near to plant entrance to provide ease of access without entering the process areas of the site. This also blocks the process areas from view from South Bay Boulevard and Highway 1, enhancing aesthetics. The operations building will be a pre-engineered building made of materials suitable for a coastal environment and made to resemble a barn to blend with the local surroundings. The maintenance building and RO/UV building will also be made architecturally compatible with the surrounding area.

## 7.5. HEADWORKS

Our proposed design connects to the influent force main at the designated location near Highway 1 and extends it to the headworks facility at the far north end of the site. We will coordinate with the influent pipeline designer regarding the appropriate pump selections for the new pump station so that the pumped flow is efficiently delivered at the proper hydraulic grade.

Based on an analysis of alternatives, we are proposing a packaged headworks system. To provide redundancy, we propose two parallel packaged headworks systems sized for the peak wet weather flow of 8.14 mgd (1 duty, 1 standby) as shown in **Figure 7.5**. Each system will include coarse screening with a washer/compactor, a screw-auger conveyor with a bagging attachment, and a vortex grit separator with washer/classifier and conveyor. This redundancy exceeds the requirement of the RFP while being more cost effective since it allows use of the standard package system configuration.

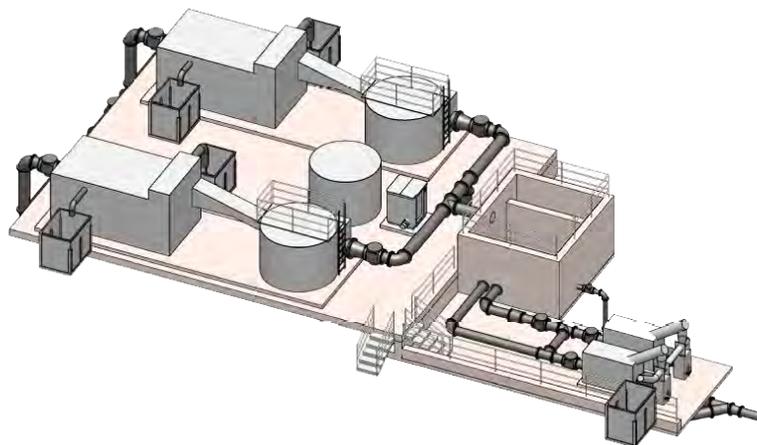

After an extensive comparison with a custom system comprised of concrete channels and basins with corrosion protective coatings, we determined that a stainless steel system would have equal longevity to concrete and provide the benefit of added redundancy. Based on cost estimating and bidding of alternatives, we found that the cost to design and construct a custom system with a single set of components is similar to that of a package system with dual units. We can provide a custom system if desired by the City at no additional cost, but without the redundancy benefit.

The channels and tanks of the headworks will be fully covered, and odor control will be provided by a packaged bio-filter tower with a centrifugal blower.

**Dual packaged headworks provides full redundancy and similar life expectancy as single custom system**

The headworks also includes fine screening as separate 316 stainless steel package systems. Two fine screen packages are provided for redundancy (1 duty, 1 standby) and are each sized for the maximum daily flow of 1.88 mgd. A splitter box is included in the headworks area to divert flows greater than 1.88 mgd to the SAFE System, allowing us to reduce the size of the BNR-MBR and other downstream facilities.

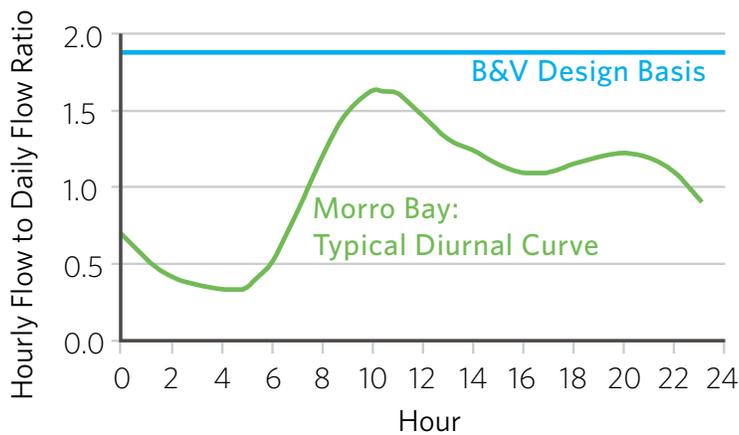

Each fine screen package is comprised of 316 stainless steel tanks with 2 mm stainless steel drum screens and a washer/compactor and conveyor. Solids from the course screening, fine screening, and grit removal will be conveyed to roll-off dumpsters sized to require pickup no more than once per week.

**FIGURE 7.5: PACKAGED HEADWORKS & SPLITTER BOX FACILITIES**

## 7.6. BNR-MBR FACILITY

As noted earlier, we have selected BNR-MBR as the preferred technology for the biological treatment process of the WRF. BNR-MBR offers several overall benefits for potable reuse applications including small foot print, high quality effluent, and ability to automate operation. From a water quality perspective, MBRs provide excellent pretreatment for RO, affording the ability to reduce cost and complexity. MBRs also provide a barrier to pathogens with industry demonstrated reductions of 5-7 log removal of total and fecal coliform and 2-4.6 log removal of indigenous coliphage. Recently DDW has unequivocally confirmed MBR will be granted pathogen reduction credits when used as part of an AWT process for potable reuse.

**FIGURE 7.6: TYPICAL DIURNAL FLOWS WILL BE TREATED IN THE BNR-MBR PROCESS WHILE HIGHER FLOWS WILL BE MANAGED USING THE SAFE SYSTEM**

Our team’s innovative WRF design also includes the use of our proposed SAFE System auxiliary filters to manage high flows. This approach eliminates the cost, space consumption, and operational complexity of a large flow equalization basin. The SAFE System also allows for a significant reduction of the size of the BNR-MBR facility, reducing both capital and O&M costs. The SAFE System is described in detail in Section 7.7. Here we focus on the resulting implications for and benefits to the BNR-MBR process design.

Figure 7.6 shows the typical Morro Bay diurnal pattern based on our analysis of 5-years (2010 – 2014) of hourly flow data. It shows that on a typical day, the highest hourly flow is less than the 1.88 mgd max day flow capacity of our BNR-MBR facility. Therefore, under normal conditions

all flow will be treated in the BNR-MBR process. By not treating the full peak flow in the BNR-MBR system, we achieve:

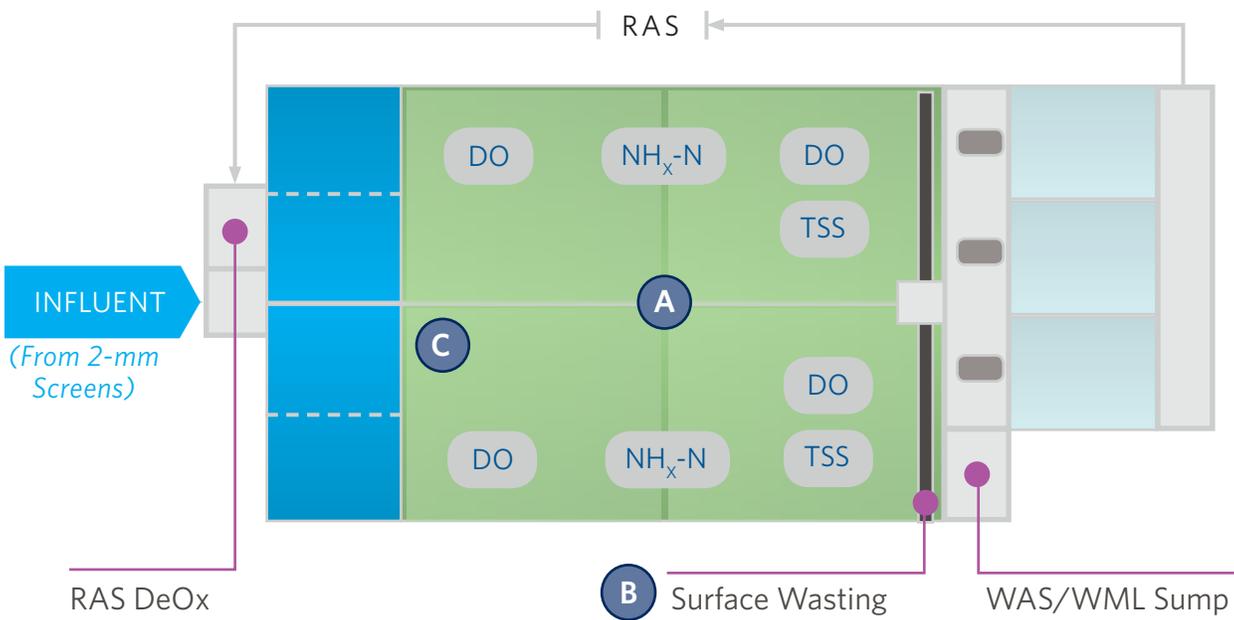

- A 30% reduction in the required membrane filtration area. This not only reduces the capital cost of our solution but also directly results in significant operating cost savings.
- Better sludge retention time (SRT) management in the BNR process with limited high-flow, low-BOD/TKN loading entering the biological process.

**BNR-MBR with SAFE System optimizes footprint, capital and energy cost, and simplifies operation**

To prepare our proposal, we evaluated critical needs for the BNR-MBR process as part of the whole WRF process train. Supported by our integrated process modeling and professional experience, we have developed a BNR-MBR facility built on four pillars: process robustness, operational flexibility, system sustainability and low life cycle costs. Figure 7.7 illustrates a process focused layout of the BNR-MBR facility. Key benefits of our design are indicated by the lettered items in the figure and described on the following page.

- a. **Effective Aeration Design Saves Money.** To minimize the aeration requirement and reduce the energy cost of treatment, Black & Veatch has designed numerous plants that achieve very high total nitrogen (TN) removal by effectively combining Simultaneous Nitrification-Denitrification (SND) with anoxic zones. Our proposed design integrates both ammonia based and dissolved oxygen (DO) based aeration control in the MLE configuration through a tapered fine bubble aeration grid. In this approach, the measured ammonia concentration in the aerobic zone is used to manage aeration and maximize SND during the course of the day. As shown in **Figure 7.7**, this results in an aeration energy savings of 15%-20%.
- b. **Improved Membrane Operation through Selective Surface Wasting.** Our design concept incorporates scum and surface wasting in the aerobic zones of the BNR basins. Surface wasting is a commonly-used operational tool in activated sludge plants to improve sludge volume index (SVI) through removal of poorly settling organisms. When using MBRs, selective surface wasting improves the removal of lighter floc and enmeshed

Proven BNR-MBR design details greatly reduce O&M costs through 15% energy reduction and extended membrane life

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**FIGURE 7.7: OUR TEAM'S SUSTAINABLE APPROACH TO BNR-MBR DESIGNS RESULTS IN A 15% ENERGY SAVINGS OVER CONVENTIONAL PROCESS DESIGNS**

colloidal material recycled from the solids handling process. Recent research suggests links between the recycling of light colloidal material and exacerbated membrane fouling. Integrating surface wasting upstream of the MBR basins will reduce the City's O&M cost by extending membrane life and reliability, easily paying for itself on a life cycle basis.

- c. **Operational Flexibility with In-Basin Equalization.** We have incorporated in-basin equalization in the BNR tanks to provide staff operational flexibility during high and low flow periods. In addition, for a marginal cost increase, this design feature will enable more effective use of the membranes and limit operations at very low flow or fluxes for extended periods of time.

### PROPOSED BNR-MBR DESIGN

As detailed in Proposal Form 5 found at the end of this section, and illustrated in the Appendix 6 drawings, we propose two parallel BNR process trains. These are sized to treat the maximum monthly flow with full redundancy (one train out of service) or a maximum daily flow of 1.88 mgd with both trains operating. Flows greater than 1.88 mgd will be diverted to the SAFE system via a splitter box located at the headworks.

The BNR basins will be a cast-in-place concrete structures with an 18-foot side water depth. In-basin equalization is provided from 1.5 feet of that depth, amounting to approximately 27,000 gallons, to help manage high and low flows. Process air is provided from single-stage, high speed turbo blowers (1 duty, 1 standby). Three MBR trains are provided with two membrane cassettes per train, sized to meet the RFP-specified design flux rates. The MBR area will be covered by a canopy for protection from the environment and a monorail system will be incorporated for cassette removal.

### FBV RECENTLY COMPLETED PRE-PURCHASE OF EQUIPMENT FOR THE 26 MGD MBR PROJECT FOR RIVERSIDE

consistently stays abreast of ongoing technology improvements and market trends so that we can bring the most recent knowledge and effective solutions to the City. Each MBR membrane system has unique characteristics. For the plant to be built and operate as planned, it is imperative to have effective and well managed collaboration between the MBR system supplier, our team's process and facilities design and your engineering and operations team.

### MBR SYSTEM PROCUREMENT CONSIDERATIONS

As part of developing our proposed design, evaluating O&M costs, and pricing the work, we evaluated several potential hollow-fiber systems. A key objective is to select an MBR system supplier that provides the City with a reliable system, proven expertise and implementation experience. Early selection of the MBR system supplier will enable Morro Bay and the FBV team to optimize the detailed design around the selected system supplier.

There are over a half-dozen well-reputed MBR system suppliers in the marketplace (see **Table 7-1** on the following page for some of the hollow fiber system manufacturers). Our team has first-hand operational knowledge with many of the suppliers' equipment and

**TABLE 7.1: COMPARISON OF SELECTED HOLLOW FIBER MBR SYSTEMS & WARRANTIES BID ON MORRO BAY'S PROJECT**

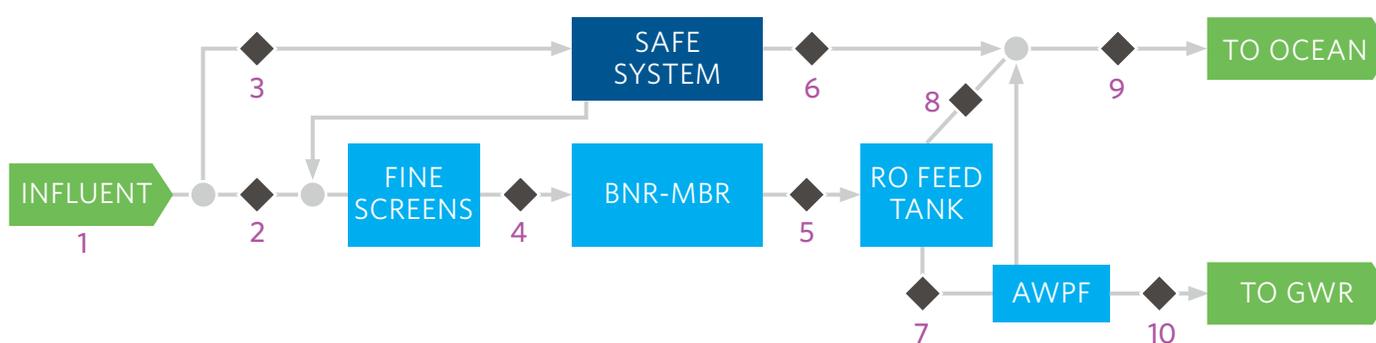

| MANUFACTURER | NO. OF NORTH AMERICAN INSTALLATIONS | MEMBRANE WARRANTY & EXTENDED WARRANTY                  | KEY MANUFACTURER DIFFERENTIATORS                                            | MEMBRANE CARTRIDGE REPLACEMENT COSTS  |

**7.7. SAFE SYSTEM**

As presented previously in Section 7.1, historical and anticipated future peak flows in Morro Bay are many times greater than average daily flows, owing primarily to wet weather events. Rather than building expensive basin capacity and treatment capability throughout the process train for high flows, we offer a significant innovation that reduces costs and simplifies operations while maintaining compliance with your waste discharge permit requirements. Our proposed design includes our SAFE System, providing auxiliary filtration system to treat high flows, thereby dramatically reducing the size of downstream processes.

Figure 7.8 is a flow balance diagram that shows how the SAFE system is engaged at flows greater than 1.88 MGD. The BNR-MBR and downstream processes will have capacity to treat at least the maximum monthly flow (MMF).

**FIGURE 7.8: SAFE SYSTEM FLOW BALANCE DIAGRAM**

|     | FLOW (MGD) |      |      |      |      |      |      |      |      |      |
|-----|------------|------|------|------|------|------|------|------|------|------|
|     | 1          | 2    | 3    | 4    | 5    | 6    | 7    | 8    | 9    | 10   |
| ADF | 0.97       | 0.97 | 0    | 0.97 | 0.97 | 0    | 0.97 | 0    | 0.19 | 0.78 |
| MMF | 1.16       | 1.16 | 0    | 1.16 | 1.16 | 0    | 1.16 | 0    | 0.23 | 0.93 |
| MDF | 2.74       | 1.88 | 0.86 | 1.94 | 1.94 | 0.80 | 1.16 | 0.78 | 1.81 | 0.93 |
| PHF | 8.14       | 1.88 | 6.26 | 2.32 | 2.32 | 5.82 | 1.16 | 1.16 | 7.21 | 0.93 |

A portion of the maximum daily flow (MDF) and the majority of the peak hourly flow (PHF) is managed using the SAFE system.

### SAFE SYSTEM OPERATION

The RFP Performance Criteria Report set the required maximum RO feed flow as the maximum monthly flow, or 1.16 mgd. When the AWT facilities are operating at full capacity and influent flow to the WRF is between 1.16 and 1.88 mgd, the excess MBR permeate flow will be diverted to the ocean outfall. We calculated that this is the minimum flow that must be maintained through the BNR-MBR facility to meet ocean discharge limits in conjunction with the SAFE system. It could be a greater diversion if the AWT facilities are operated at a lower flow, or offline altogether, for any reason. These outfall flow conditions are normal occurrences and achieved through an overflow of the RO feed tanks whenever the plant inflow exceeds the RO feed pumping rate.

During a wet weather event, when flow is greater than 1.88 mgd, the storm-induced excess goes to the SAFE system through a passive overflow weir in a splitter box upstream of the fine screens. The flow filtered by the SAFE system is blended with the BNR-MBR excess permeate in the Outfall Balancing Tank described in Section 7.10.

Our team evaluated the expected quality of the ocean discharge comprising three streams: wet weather flow filtered by the SAFE system, excess MBR filtrate not directed to the Advanced Water Purification Facility (AWPF) and RO concentrate. As shown in **Figure 7.7**, the TSS of a daily composite sample of the blended effluent from these flow streams will be below the monthly average requirement under all conditions and well below the weekly average requirement. For example, if the influent flow is 2.5 mgd and the AWPF runs at its capacity of 1.16 mgd, the blended outfall TSS is approximately 21 mg/l, less than the 30 mg/l limit. The outfall water quality improves when the AWPF is not running since the MBR permeate that would have gone to the AWPF will instead go to the outfall, thereby providing a more diluted blend. It is important to recognize that regardless of flow, whenever the SAFE system is in use there will always be an MBR permeate flow stream available for blending.

### SAFE SYSTEM DESIGN

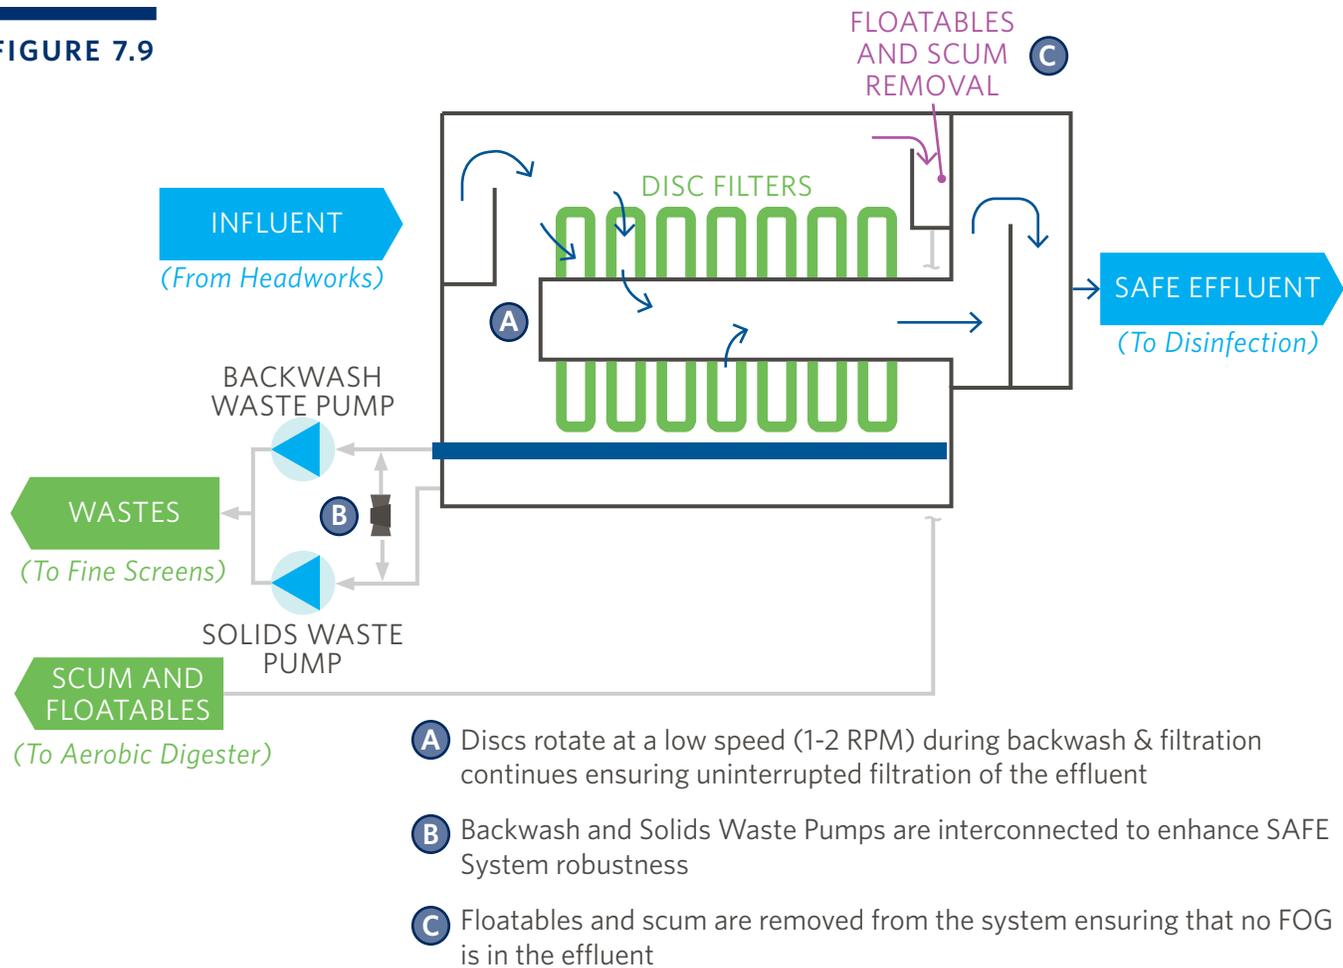

Following an evaluation of potential treatment technologies for the SAFE system, our team has determined that disc filtration is an effective technology for the City to consistently achieve the ocean discharge effluent TSS and BOD5 requirements. Disc filters provide a physical filtration barrier with a nominal pore size of 5 mm for filtration of the screened influent. **Figure 7.9** on the following page is a schematic diagram of the key features of our proposed disc filtration system. With this approach, 100% of the flow sent to the ocean outfall is filtered.

The unit we propose is sized at 6.26 mgd and consists of cloth media discs for BOD removal and filtration of suspended solids.

---

There are several types of EHRT solutions such as the Actiflo®. The SAFE System is the optimal EHRT system as it does not use chemicals, is lower in energy consumption, requires less maintenance, and is simpler to operate.

FIGURE 7.9

It will be pre-engineered in a 304 stainless steel tank and installed on a concrete slab on grade. The tank will be covered to protect the filters from sunlight and other exposure during the long periods between use.

After each use, the tank will be drained, and the system will be ready for the next high flow event. Backwash pumps provided with the system will route waste flow back to the headworks, thereby requiring an increased capacity of the fine screens and BNR-MBR facilities, as accounted for previously in **Figure 7.8**.

### REGULATORY CONSIDERATIONS FOR THE SAFE SYSTEM

An important aspect of the project will be to ensure that the effluent discharged to the ocean from the WRF meets the Final Effluent Limitations in the City's NPDES permit. As described previously, with the proposed design comprised of the BNR-MBR process and SAFE system, the WRF will consistently achieve the target effluent quality goals. Our evaluation of the City's NPDES Permit indicates that the effluent from our proposed process design meets the definition of secondary treatment in 40 C.F.R.133.102. We are confident that the Regional Board will acknowledge the innovative approach we have taken to cost effectively address wet weather flows while achieving a high-quality ocean discharge.

We have provided a detailed permitting strategy for the SAFE System in Section 5 and discuss where it has currently been permitted.

## 7.8. REVERSE OSMOSIS

Based on our experience with advanced water treatment facilities throughout California, we know that the composition of feed water with respect to general parameters (temperature, pH, turbidity, etc.), inorganic constituents (e.g. dissolved ions, metals, silica etc.) and organic constituents can have a significant impact on the design, performance, and O&M requirements of RO systems. We also know that sparingly soluble salts can lead to RO scaling/fouling, greatly impacting O&M costs due to the need for frequent cleaning, increased chemical costs and offline time, and reduction in operating recovery and increased energy use.

To develop our proposed design, our water quality and process experts took a systematic approach to estimating the RO feed water quality for the WRF. This included evaluating source water quality data and estimating wastewater concentration factors using a BioWin model. BioWin modeling was also used to support our BNR-MBR design. The source water quality evaluation included a range of blends among Morro Bay's water supply sources, including State Water Project and well water. Wastewater concentration factors looked at pre-drought and post-drought scenarios.

We utilized this data to optimize feed pressure pumping, sustainable recovery, and pre-treatment requirements. We also optimized RO system O&M costs with respect to energy and chemicals. These findings contributed to optimization of the downstream UV/AOP process as well.

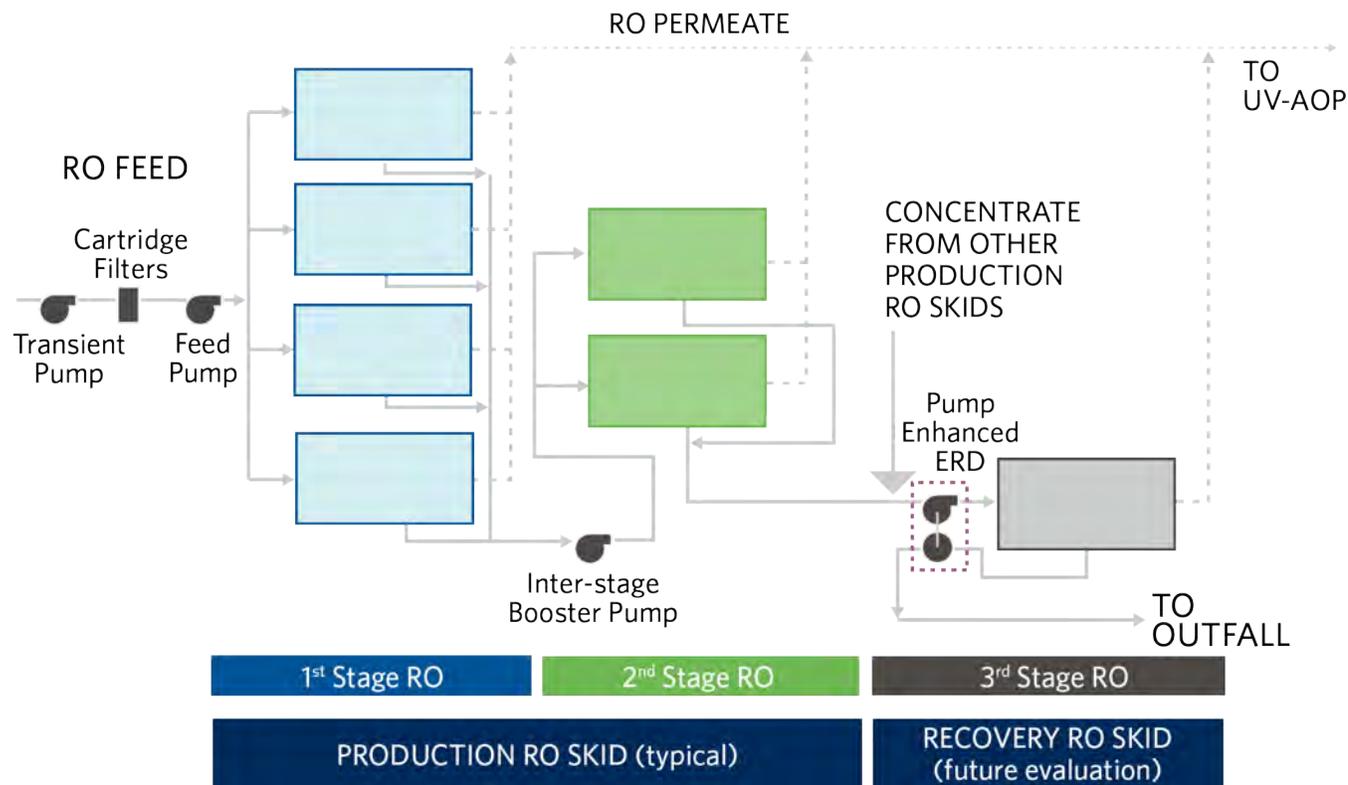

### RO SYSTEM DESIGN

The MBR permeate pumps will fill two parallel RO feed tanks having a total capacity of 30,000 gallons. From there, three parallel high pressure vertical turbine pumps will feed three cartridge filters and then three 2-stage RO units, with one feed pump dedicated to each train. This three train (3 duty, 0 standby) design allows operation over a wide range of permeate capacities (0.31 to 0.93 mgd) to meet diurnal variations in available RO feed flow and to meet annual permeate flow requirements of 825 AFY. The flexibility afforded by this design will allow the City to maintain production during all feed flow conditions.

Our RO design is based on a conservative 80 percent design recovery based on our preliminary feed water quality analysis. By targeting a conservative recovery, the City benefits from the eliminated need for acid pretreatment, lower feed pressure requirements, and reduced cleaning frequency and need for specialty cleaning chemicals.

Note that our system does have the flexibility to range between 75 and 85 percent recovery should there be changes in feed water quality. The City could consider increasing recovery in the future at modest cost compared with the capital and operating cost of a third stage. Figure 7.10 on the following page illustrates the RO design.

FIGURE 7.10: RO SYSTEM

A further benefit of our RO design is the incorporation of dedicated inter-stage boost pumps for each RO unit. This allows precise control of the flux between stages over a range of operating conditions to reduce pressure and scaling. We also performed a cost-benefit evaluation of energy recovery devices, but they did not add value. Thus, our proposed design includes a 2-stage RO design that provides lower life cycle cost than a system with an independent 3<sup>rd</sup> stage equipped with feed water pH suppression and an energy recovery device. During final design, we will work with you to perform a detailed evaluation to optimize the solution, looking at UV/AOP.

### RO FEED WATER QUALITY DETERMINATION

The composition of feed water with respect to general parameters (temperature, pH, turbidity, etc.), inorganic constituents (e.g. dissolved ions, metals, silica etc.), and organic constituents can have a significant impact on the design, performance, and O&M requirements of reverse osmosis (RO) systems. Our team's experience with the design, operation, and evaluation of RO systems used for water reuse in California has shown sparingly soluble salts such as calcium carbonate, calcium phosphate, silica or silica metal salts can lead to RO scaling/fouling. This occurrence often leads to the need for frequent cleaning, resulting in increased chemical costs and offline time and reduction in operating recovery.

Leveraging our experience with the design and operation of numerous California AWT facilities, our water quality and process experts took a systematic and comprehensive approach to estimating the RO feed water quality for the Morro Bay WRF.

Our experience results in the following benefits:

- Establishes a basis of design for the RO system, with respect to feed pressure pump sizing, sustainable recovery and pre-treatment requirements to ensure the system meets the required permeate quality and production requirements.
- Allows a realistic estimate of RO system O&M costs with respect to energy, chemical pre-treatment and cleaning chemicals.
- Provides a basis for estimating RO permeate quality via standard RO manufacturer modeling tools that was then used as the basis of design for the downstream treatment processes including the UV AOP and remineralization systems.

**Step 1:** We reviewed three years (2014-2016) of Morro Bay's drinking water source quality as published in the Annual Consumer Confidence Reports including surface water from the State Water Project and the City's well water. This information was used to estimate the average concentrations of key inorganic parameters present in Morro Bay's drinking water over a range of source water blending conditions. The analysis included estimating Morro Bay's drinking water quality based on source water blends of 87% State Water: 13% well water and 96% State water: 4% well water. The treated well water quality was estimated based on a nominal 95% rejection of inorganic constituents by RO and a 35% bypass.

**Step 2:** Wastewater concentration factors for key inorganic constituents were determined using historical RO feed water quality from the nearby Silicon Valley Advanced Water Purification Center and potable drinking quality from the Santa Clara Valley Water District's annual water treatment plant operation and compliance data. A range of wastewater concentration factors we estimated by taking the ratio of RO feed water concentrations (pre-drought and post-drought) and potable water concentrations.

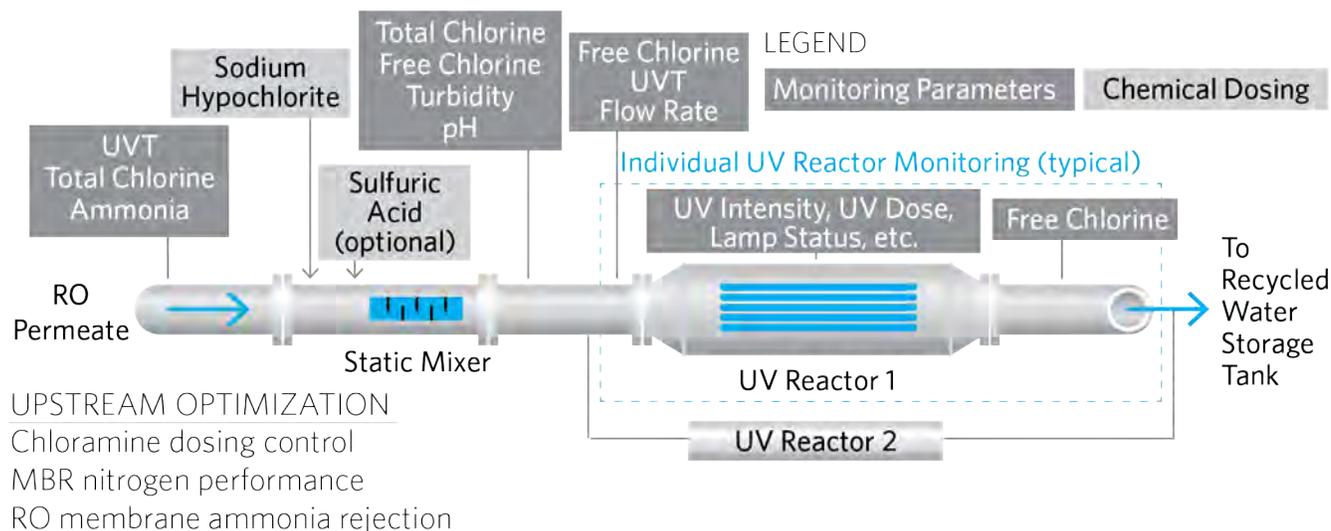

**Step 3:** The wastewater concentration factors determined in Step 3 were applied to the Morro Bay drinking water source quality for inorganic constituents estimated Step 1. The results of this analysis represent the estimated Morro Bay RO feed water quality as summarized in Proposal Form 8. The typical values are based on concentration factors associated with pre-drought and high blend of State Water, while the maximum values are based on post drought and lower blend of State Water. Values shown for general parameters and nutrients are based on review of Morro Bay's historical and specialized wastewater sampling data and BioWin modeling conducted as part of the MBR design.

## 7.9. UV/AOP & POST TREATMENT

A schematic of our proposed design for the UV/AOP system is depicted in **Figure 7.11** on the following. The UV/AOP system is expected to meet or exceed the RFP performance criteria. We evaluated our proposed system and found that it can be expected to achieve greater than 0.7 log reduction of 1,4-Dioxane (greater than the RFP minimum 0.5 log) and greater than 0.84 log reduction of NDMA. We have direct experience with DDW permitting of systems treating 1,4-Dioxane, so will follow the same process we have in the past to help obtain that permit.

Our proposed UV system will consist of two low pressure, high output (LPHO) UV reactors, each capable of treating a flow range of 0.31 to 0.93 mgd (1 duty, 1 standby). After evaluating both alternatives, we chose chlorine as the oxidant, rather than hydrogen peroxide. A UV/chlorine system has a potential to be more efficient for both energy use and oxidant dose.

FIGURE 7.11: UV/AOP SYSTEM

Chlorine also has other process applications onsite, eliminating the cost and complexity of building and maintaining dual chlorine and hydrogen peroxide systems. Finally, chlorine avoids significant residual quenching costs associated with UV/H<sub>2</sub>O<sub>2</sub> for applications such as WRF that require downstream free chlorine disinfection to meet DDW's pathogen reduction requirements.

Due to the corrosive nature of the AOP effluent, post-treatment stabilization is required to protect the downstream product storage and conveyance systems. For your WRF, we evaluated using either liquid lime with carbon dioxide or calcite contact filters with sodium hydroxide. After preliminary evaluation of both cost and operational considerations, our proposed design utilizes the calcite system. Calcite contactors provide a cost effective, low-maintenance, approach to achieve stabilization goals, and calcite can be provided with required NSF rating for potable reuse. Parallel contactor design will allow one contactor to be taken offline for maintenance and still maintain target plant production. This system requires the addition of sodium hydroxide for pH adjustment.

### 7.10. RECYCLED WATER SYSTEM & PATHOGEN REDUCTION

Water treated by the UV/AOP system will be sent to a 0.5 MG glass lined bolted steel recycled water storage tank. A pump station will deliver recycled water from that tank to the offsite groundwater recharge field. A second pump station will divert recycled water to a hydropneumatic tank for onsite landscape irrigation and other non-potable use. The water entering the storage tank will be disinfected with sodium hypochlorite. The disinfection is designed to achieve 12-log enteric virus reduction, 10-log Giardia cyst reduction, and 10-log Cryptosporidium oocyst reduction, meeting CA Title 22 Code requirements.

**Table 7.2** on the following page illustrates our proposed pathogen reduction approach for the WRF. In addition to the significant removal provided by the advanced water treatment processes, multiple additional barriers of pathogen reduction are provided,

including 1 to 2- log reduction by the MBR, 4-log reduction by pipeline chlorine disinfection, and 2-log reduction for underground retention. These removals/reductions allow for excursions in process performance and online monitoring while ensuring continuous public health protection. The values assigned to MBR are based on recent discussions FBV has had with DDW. During said discussions, DDW has confirmed the LRV values shown will be granted based on filtrate turbidity monitoring alone and operation within an established window of operating conditions. Additional credit (not shown) may be granted if demonstration testing is conducted.

**TABLE 7.2: PROPOSED PATHOGEN REDUCTION APPROACH**

| TECHNOLOGY      | MBR | RO  | UV/AOP | PIPELINE FREE CHLORINE | UNDERGROUND RETENTION | TOTAL ACHIEVED | DDW REQUIREMENT |
|-----------------|-----|-----|--------|------------------------|-----------------------|----------------|-----------------|
| Virus           | 1   | 1.5 | 6      | 4                      | 2                     | 14.5           | 12              |
| Giardia         | 2   | 2   | 6      | 0                      | 2                     | 12             | 10              |
| Cryptosporidium | 2   | 2   | 6      | 0                      | 2                     | 12             | 10              |

### 7.11. OCEAN OUTFALL SYSTEM

The existing ocean outfall will continue to be used by the new WRF. A new outfall pipeline will connect the WRF to the existing outfall adjacent to the City's existing wastewater treatment plant.

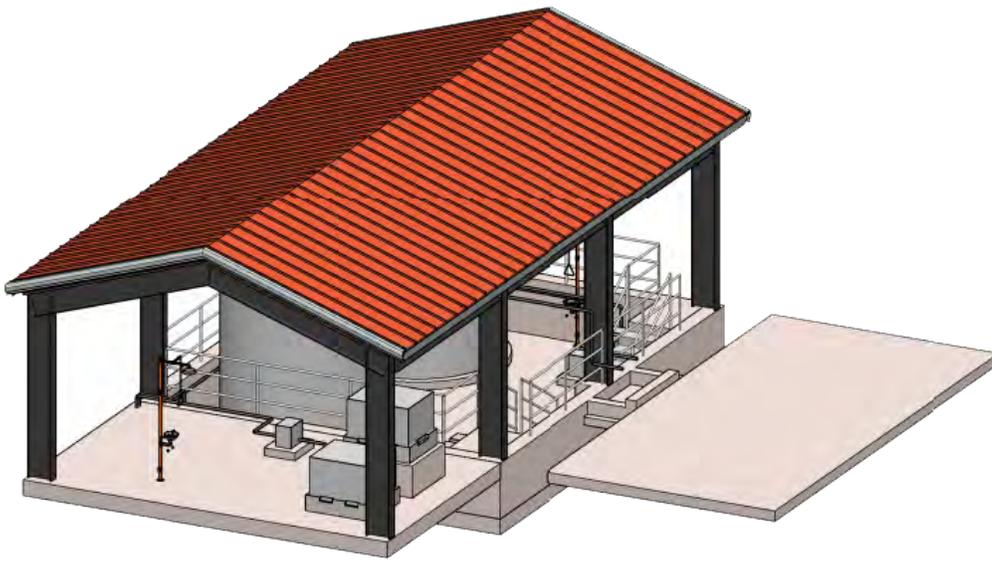

During normal operation, the outfall will be used primarily to dispose of RO concentrate flows and excess MBR permeate flows above the RO system capacity. When plant inflow is greater than the capacity of the BNR-MBR facility, the SAFE system will be engaged. Flows treated by the SAFE system will be blended with MBR permeate in an Outfall Balancing Tank to achieve the permit required water quality for ocean discharge. The Outfall Balancing Tank will also serve as a forebay for the outfall pump station. The MBR permeate will reach the tank by overflowing a weir in the RO Feed Tanks; controls will be established to create the proper blend.

The outfall pump station will be located adjacent to the outfall balancing tank and near the recycled water pump station. A key component of the design was to ensure the appropriate level of disinfection is provided to meet the ocean outfall limit for total coliform under all flow conditions. Our innovative, cost saving solution is a pipeline contactor sized to provide sufficient contact time under peak hour flow conditions to meet a CT of 350 mg/L-min and provide a 3.7 log reduction of total coliform, the level of disinfection anticipated to be needed to meet the ocean outfall limits. Since this treatment must be achieved before the flow leaves the WRF site, the pipeline contactor includes an approximately 1,500-foot long, 48-inch diameter pipeline that wraps around the perimeter of the site. This approach is more cost effective than utilizing a chlorine contact basin, as the space needed for siting leads to a significant increase in overall project cost. Before leaving the site, the flow will be dechlorinated with sodium bisulfite.

## 7.12. CHEMICAL STORAGE & FEED

Our proposed design includes a chemical bulk storage and feed facility. It is centrally located on site and convenient to the various process areas that require chemical dosing, thereby minimizing piping runs. This facility will store sodium hypochlorite, sodium hydroxide and sodium bisulfite, all under a pre-engineered metal canopy to protect from the elements.

**FIGURE 7.12: CHEMICAL STORAGE AND FEED AREA**

The sodium hypochlorite and sodium hydroxide will be stored in bulk in a common containment area due to their compatibility. The tanks will be sized to accommodate delivery of at least a full truck load and will supply at least 15 days of maximum consumption.

The chemical unloading area can be accessed conveniently and safely by delivery trucks by simply pulling to the shoulder of the main plant access road. Sodium bisulfite, used in lesser quantity, will be fed to IBC totes positioned in containment tubs for secondary containment.

All chemicals will be metered to their destinations from peristaltic pumps with on-board controllers. The feed pumps will be pre-skidded by the manufacturer to minimize the time and expense associated with field assembly and troubleshooting of intricate small diameter piping and wiring. To ensure environmental protection once outside of the chemical storage area, the pumps will deliver each chemical to their respective feed point through a system of double contained pipe that will be bundled and encased in a chemical duct bank. The chemical duct bank will be aligned in the eastern utility corridor, to route chemicals throughout the site to their intended destinations, while also facilitating monitoring of these systems with leak detection.

In addition to the central chemical facility, several remote facilities are provided to store and feed specialty, process-specific chemicals. For example, a lean-to protected chemical area will be provided outside of the RO/UV building to feed citric acid and antiscalant from IBC totes, with space for sulfuric acid feed in the future, if needed. The MBR facility will also have a dedicated citric acid feed system for membrane cleaning. Finally, the dewatering system will include a dedicate polymer feed at that location.

### 7.13. SOLIDS

Our proposed design includes a solids handling area comprised of an aerobic digester and a belt filter press for dewatering, depicted in **Figure 7-13**. The aerobic digester will function essentially as a sludge holding tank to provide operational flexibility for scheduling dewatering. The digester is sized to handle 14 days of sludge. A dividing wall in the cast in place

concrete basin will split the storage into two 7-day chambers, providing additional operational flexibility to use one or the other or both halves at once. This will be a benefit for maintenance, as well.

Sludge will be aerated by blowers feeding a grid of coarse bubble diffusers. They are sized and plumbed to enable aeration of either or both basins at once. The blowers will operate on a controlled cycle to promote denitrification and alkalinity management. When the blowers are off cycle, mixers installed in each basin will operate to promote minimal aeration and circulation. Two rotary lobe pumps are provided to lift the sludge from the digester to a belt filter press for dewatering. The press is sized to be operated two days per week for 8 hours each day. It will be designed and selected to produce dewatered sludge having a minimum solids content of 16 percent with aid of a polymer feed. We selected belt filter presses over screw presses because belt press manufacturers were willing to guarantee 16 percent solids. The screw press manufacturers we approached attempted to sell that they can provide that performance as well, but were not willing to make a guarantee.

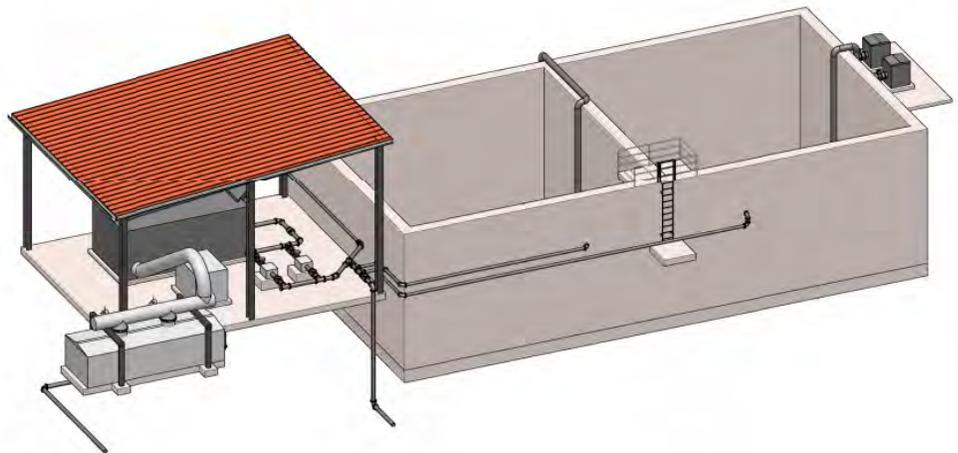

The dewatering system will include a conveyor to lift solids from the belt filter press to a covered roll-off dumpster, with a motorized knife gate system designed to distribute solids evenly in that container. This innovative approach minimizes the space that must be odor controlled and simplifies the operation and maintenance requirements of the system.

To select the optimal dewatering system for Morro Bay WRF, our team evaluated a suite of currently operating belt press and screw press installations in the U.S. (eight installations in CA, GA, OH) used for dewatering MBR WAS with no primary sludge. The results of our evaluation indicate that the cake solids are typically comparable between these two technologies. Key benefits of Belt Filter Press for MBR WAS dewatering include:

- Belt Presses capture WAS fines more effectively than screw presses resulting in less return of fines to the BNR-MBR process and reduced membrane fouling. This directly reduces the operating costs for the Morro Bay WRF.
- Polymer use for MBR-WAS dewatering using belt presses is typically 50% compared to screw presses resulting in annual savings between \$35,000 - \$40,000.

**The results of our evaluation indicate that the cake solids are typically comparable between these two technologies.**

**FIGURE 7.13: SOLIDS HANDLING SYSTEM**

Our controls design focused on ensuring performance, reliability and security, including:

1. *Network segregation between the the plant process control network and the plant SCADA network to ensure the most optimized network.*
2. *Redundant communication links between the plant process control network and the plant SCADA network for increased reliability.*
3. *Separation of the plant process network and the plant non-process network with multiple firewalls for cyber security measures.*
4. *No direct external internet connection for the plant control network for maximum cyber security protection.*
5. *Cyber security measures like encrypted wireless network with non-broadcast SSID and static IP addresses for approved plant devices only to protect the plant from any external threats through the on-site wireless network.*
6. *Strategically located plant operation stations and local vendor equipment interface screens for the ease of operation.*

#### 7.14. ELECTRICAL, INSTRUMENTATION & CONTROL (I&C)

Significant thought was put into the electrical and I&C designs to make them functional, reliable, and efficient. These systems often make or break the ultimate success of WRF facilities. We look forward to collaboratively melding our ideas with the City's operations staff on these topics once in the design phase of work.

**Electrical Design.** Our electrical design includes equipment centered in two locations, a dedicated electrical building and a separate electrical room in the RO/UV building. This approach of using multiple distributed load centers strategically located close to the process equipment, with radial distribution to each destination, is efficient because it reduces energy loss in the cabling. Distribution will be in duct banks aligned primarily on the western edge of the site, away from most wet utilities and out of the access road where maintenance could disturb plant access. The dedicated electrical building is located at the head of the plant to house the 2000A main service switchboard, transfer switch, two motor control centers (MCC) for the headworks, MBR, dewatering and chemical facilities, and the main PLC panel. We co-located the utility transformer and the emergency generator in this area to reduce the energy loss of the interconnecting cables and for the ease of future maintenance. The main switchboard will have sufficient space for future photovoltaic equipment. The separate electrical room located inside the RO/UV building includes an MCC to serve the RO, UV, product water area, and Operations and Maintenance buildings.

**I&C Design.** The I&C design features a self-healing fiber optic ring for the plant control network. Ethernet-based communications will be used between Plant PLCs and the SCADA I/O servers and between the Plant PLCs and vendor PLCs. Distributed remote I/O panels will be employed in the RO area, chemical area, MBR area, solids area, and the headworks are to minimize hardwired cabling.

#### 7.15. STARTUP, TESTING & COMMISSIONING

Another key to project success is a well-orchestrated startup, testing, and commissioning process. The key is to develop a plan early in the construction process, preferably at least six months before startup is to begin. This allows input from all stakeholders, including the City and permitting entities. Our team includes full-time startup professionals, led by Jorj Long, that will develop and implement our startup plan. We have provided a draft of the startup plan that we will utilize for your facility in Appendix 2. It provides guidance on our plan for functional testing of each process element, followed by acceptance testing that will enable beneficial occupancy. We are also committed to supporting the City during the 6-month Performance and Operation Testing period to ensure you are satisfied with your new WRF. Our detailed analysis of the life cycle costs for our proposed design can be found in Appendix 5.

#### PROPOSAL FORMS

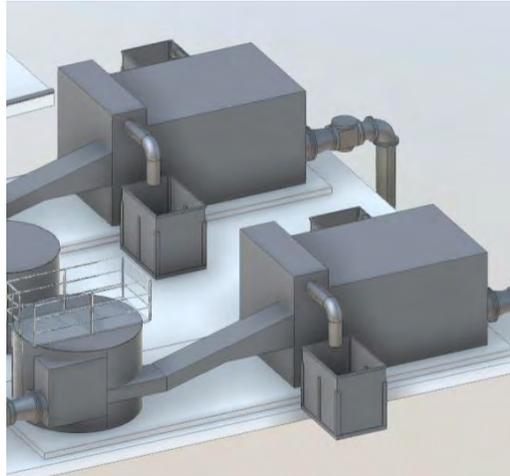

Proposal forms describing our proposed design are included on the following pages. These forms describe our detailed design approach for each of the facilities, any variations from the performance criteria report, and the operations description. We look forward to reviewing these with you to assure alignment with your requirements.

---

# REQUIRED PROPOSAL FORMS

## Attachment E, Proposal Form 1 System Description – Coarse Screening

Two packaged headworks units are proposed to meet the City's RFP requirements. Each unit contains a bar screen and vortex grit unit. This form covers the coarse screen components of the packages. The vortex grit components are covered on Form 2.

### Key Overall Facility Features

- Two Packaged Headworks Systems are furnished, each rated at full plant peak hour capacity of 8.14 mgd. 1 duty / 1 standby.
- Each package headworks includes coarse screening and grit removal.
- Coarse screening includes screens, washer/compactors, conveyor to dumpster, and odor control.
- Skid mounted metal channels and tank construction. 316 stainless steel construction.
- Manual isolation valves for each Packaged Headworks System.
- Ability to bypass both Packaged Headworks Systems via bypass pipe and manually operated valves.
- Built-in bypass/overflow around the coarse screens directly to the grit removal system.
- Fully covered channels and tanks for odor control.
- Manufacturer: Kusters Zima, Huber, Lakeside Equipment, or equal.

### Equipment (Package Headworks)- Coarse Screens

- 2 screens @ 8.14 mgd each, one in each package. 1 duty / 1 standby at peak hour flow.
- ¼" (6 mm) bar spacing, 316 stainless steel.
- Furnished by packaged headworks manufacturer as part of the package.

### Equipment (Package Headworks)- Washer/Compactor/Conveyor

- 2 washer/compactors, one in each package integrated into each coarse screen.
- 316 stainless steel wetted components.
- Integrated Screw-auger conveyor included for each package.
- Discharge to dumpster. Bagging attachment included on chute. Dumpster area can accommodate up to a 20-yard dumpster. A 4-yard is anticipated for weekly disposal based on published debris loading rates. Dumpster to be provided by hauling company.
- Furnished by packaged headworks manufacturer as part of the package.

**Attachment E, Proposal Form 1**  
**System Description – Coarse Screening**

**Control Features**

- Local control panel by Packaged Headworks System manufacturer with Plant PLC start/stop and monitoring.
- Operators manually select which unit(s) operate and leave them running continuously.
- Local control panel for each Packaged Headworks System initiates operation of rake, washer/compactor, and conveyor.
- No operator intervention required for bypass or overflow of coarse screens. Operator intervention required for bypass or overflow of the Packaged Headworks System.

**Variations from PCR**

- Two screening washer/compactors are being furnished instead of one because each Packaged Headworks System includes a coarse screen with integrated washer/compactor.

**Attachment E, Proposal Form 1**  
**Operations Description – Coarse Screening**

**Purpose**

The coarse screens collect and remove suspended debris and solid material from the plant influent flow stream to protect the plant equipment. Screenings are delivered to a washer compactor. Plant water is used to wash the screenings which removed soluble organics from the screenings which are utilized in the MBR. The unit compacts the screenings and deposits the material into a screenings container.

**Description**

The plant influent includes flow from the influent main and the plant drain system. Plant drain flow is metered separately.

**Coarse Screens**

Wastewater enters the headworks and can be directed to Coarse Screen No. 1 or No. 2 or bypassed to the grit basin effluent and to the Splitter Box. If flow is bypassed it will be diverted to the SAFE system for treatment. Wastewater passes through the bar rack while solids are captured in the rack. The retained solids blind the screen basket surface, causing an additional filtering. Automatic screen operation is based on differential level and time. The cleaning rakes are driven by the chains and travel upwards transporting the screenings upwards along the apron which comes after the bar rack. A hinged wiper pushes the screenings from the rake shelf over the discharge chute and directs them to the washer compactor.

Screen control is set through the local control panel (LCP). With the control selector switch in the Auto position the screen will be operate based on level control and/or time control. In Hand screen operation is controlled locally using the Forward and Reverse switches. Rake speed can be adjusted locally and speed viewed on the LCP. The screen will shut down on high toque, motor overload and if the E-Stop is pressed. Screen status, operating mode and alarms are transmitted to SCADA thru the PLC.

**Level Control**

Water level is measured upstream and downstream of the screens. When a preset differential level is reached a raking event starts at a preset low speed setpoint. In the event a high-high level is reached the screen speed will increase to the high speed setpoint. The rake high speed control has an adjustable delay timer.

**Timer Control**

A programmable timer is used to initiate raking events. During periods of low flow the rake may not reach levels high enough to trigger an event. A 24 hour programmable timer can be set to periodically operate the rake to make sure that screenings stay fresh.

**Washer Compactor**

Washer compactor operation is interlocked with the screen rake. Compactor control is set locally. With the control selector switch in the Auto position the compactor starts when a screening event is initiated. The spray water solenoid valves opens and the compactor starts and runs forward for a preset time period. Compacted material is discharged into a screenings discharge chute that holds a screenings bag. When full the bag is dropped into the screenings container. In Hand the washer compactor operation is controlled locally using the Forward and Reverse switches. The unit will shut down on low spray water pressure and when the E-Stop is pressed. Compactor status, operating

**Attachment E, Proposal Form 1**  
**Operations Description – Coarse Screening**

mode and alarms are transmitted to SCADA thru the PLC.

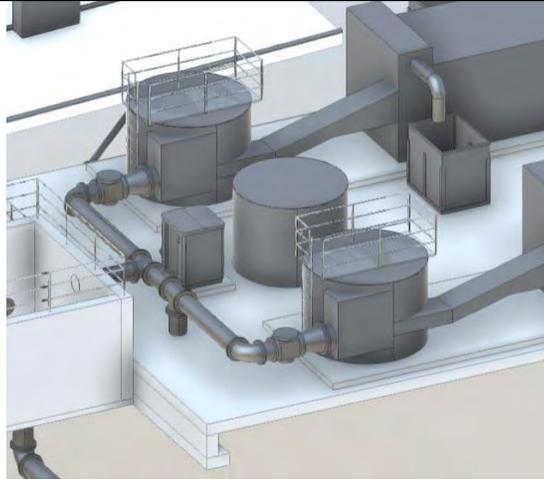

**Normal Operation**

Normally one screen is selected for use in Remote Auto control.

**Alternate Operations**

1. If Coarse Screen No. 1 fails in Remote Auto Manual the unit may be operated from SCADA by selecting Remote Manual and cycling the screen. This option requires manual operation of the compactor.
2. If Coarse Screen No. 1 fails in Remote Auto the unit may be operated locally using the local control selector switch.
3. If Coarse Screen No. 1 should fail the Operator can open the valve to the Coarse Screen No. 2 and close the valves to Coarse Screen No. 1. Coarse Screen No. 2 controls will be placed in Remote Automatic.
4. Should both screens fail to operate the screens may be bypassed to the grit gates by opening the bypass valves.

## Attachment E, Proposal Form 2 System Description – Grit Removal

Two packaged headworks units are proposed to meet the City's RFP requirements. Each unit contains a bar screen and vortex grit unit. This form covers the vortex grit removal components of the packages. The coarse screen components are covered on Form 1.

### **Key Overall Facility Features**

- Two Packaged Headworks Systems, 1 duty / 1 standby. Includes coarse screening and grit removal.
- Grit removal includes screens, washer/classifiers, conveyor to dumpster, and odor control.
- Skid mounted metal channels and tank construction. 316 stainless steel construction.
- Manual isolation valves for each Packaged Headworks System.
- Bypass/Overflow around both Packaged Headworks Systems by isolating both headwork systems to cause flow to flow directly to the flow splitter box.
- Fully covered channels and tanks for odor control.
- Manufacturer: Kusters Zima, Huber, Lakeside Equipment, or equal.

### **Equipment (Package Headworks)- Vortex Grit Removal**

- 2 vortex grit units @ 8.14 mgd each. One integrated into each Packaged Headworks System. 1 duty / 1 standby at peak hour flow.
- 316 stainless steel tank and components.
- Removal Rate @ 0.97 MGD:  $\geq 50$  Mesh = 95%; 50-70 Mesh = 95%; 80-100 Mesh = 65%.
- Furnished by packaged headworks manufacturer as part of the package.

### **Equipment (Package Headworks)- Grit Pump**

- 2 pumps total, one integrated into each Packaged Headworks System. 1 duty/1 standby.
- 250gpm rated flow.
- Discharges into grit removal washer/classifier.
- Furnished by packaged headworks manufacturer as part of the package.

### **Equipment (Package Headworks)- Washer/Classifier/Conveyor**

- 2 units total, one integrated into each Packaged Headworks System. 1 duty/1 standby.
- 316 stainless steel wetted components.
- Screw-auger conveyor.
- Discharge to dumpster. Dumpster area can accommodate a 20-yard dumpster. A 4-yard is

**Attachment E, Proposal Form 2**  
**System Description – Grit Removal**

anticipated for weekly disposal based on published debris loading rates. Dumpster to be provided by hauling company.

- Furnished by packaged headworks manufacturer.

**Control Features**

- Local control panel by Packaged Headworks System Packaged Headworks System manufacturer with Plant PLC start/stop and monitoring.
- Operators manually select which unit(s) operate and leave them running continuously.
- Local control panel for each Packaged Headworks System initiates operation of paddle, grit pump, washer/classifier, and conveyor.
- Operator intervention required for bypass or overflow of the Packaged Headworks System.

**Variations from PCR**

- Two vortex grit removal systems and washer/classifiers are being furnished instead of one because each Packaged Headworks System includes a vortex grit removal system and washer/classifier. Providing two Packaged Headworks Systems decreases the cost to the City.

## Attachment E, Proposal Form 2 Operations Description – Grit Removal

### Purpose

Grit consists of inorganic material, such as sand, silt, and gravel. The grit removal system consists of a vortex grit basin, two grit pumps and a grit separator and classifier. Grit is removed from the wastewater to prevent damage to equipment and piping and the reduction of tank volume.

### Description

#### Grit Basin

The grit basin inlet flume produces a straight laminar flow that minimizes turbulence at the inlet of the basin. Grit already at the bottom of the flume follows a ramp at the end of the inlet flume to the floor of the basin. The inlet baffle at the end of the flume helps the incoming flow to properly merge with the circular flow already inside the grit basin. The configuration of inlet flume, inlet baffle, and rotating paddle generates the toroidal flow pattern required for proper operation of the flat floored vortex grit basin.

The toroidal flow pattern moves water upward through the vortex at the center of the basin, across the surface of the water toward the outer wall, down the outside wall toward the floor, and across the floor back to the center again. Wastewater is also flowing simultaneously with the toroidal flow around the basin in a circular flow pattern. The combined effect of the two flow patterns retains grit in the basin for more than one circular rotation around the basin, effectively increasing the amount of time grit is retained in the basin, thus increasing the opportunity for grit to be captured on the floor.

The settled grit migrates toward the center of the hopper and falls into the grit storage hopper. The shaft on which the rotating paddles are attached extends only to the bottom of the separation basin.

#### Grit Pumps

Two centrifugal pumps operate periodically to remove grit slurry from the

#### Grit Separator and Classifier

The grit separator separates the pumped grit from the carrier water. The separator works on the principal of centrifugal force. The grit pump discharges settled grit slurry and some organics into the separator at a controlled rate. The slurry enters the separator tangentially near its upper perimeter. The round shape of the separator imparts a circular motion inside the unit. The heavier grit is forced to the outside of the cone and moves down the sides, falling into the grit classifier below the separator. The carrier water and lighter organics exits the separator at the top of the cone to return to the grit basins.

The grit classifier separates the grit from the organics and consists of an inclined tank with an inclined screw. The grit and organics falls from the grit concentrator into the tank, where it is washed using plant effluent water. The water flow rate through the tank is sufficient to carry the lighter organics out the settling basin overflow weirs to return to the in-plant drain while permitting the heavier grit to settle to the bottom of the tank. The grit is carried up the inclined screw allowing the grit to dewater before falling into a grit hopper for offsite disposal.

### Normal Operation

**Grit Basin:** On-line

**Grit Basin Paddle:** Run continuously.

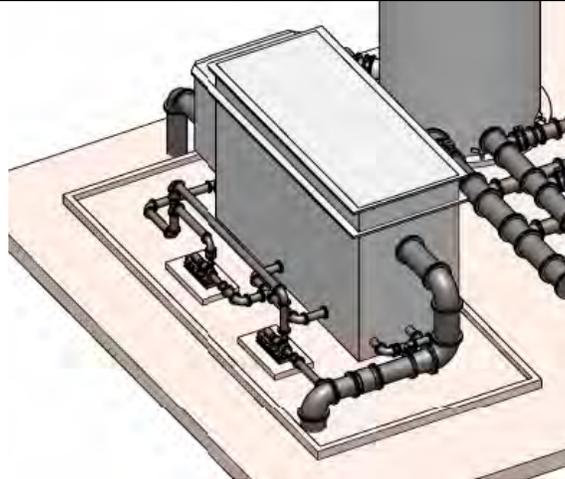

**Grit Pump:** Runs periodically based on preset timer.

**Attachment E, Proposal Form 2**  
**Operations Description – Grit Removal**

**Grit Separator and Classifier:** Starts 5 minutes before grit pump runs and continues running for a preset time period after the grit pump stops.

**Grit Container:** Manual

**Attachment E, Proposal Form 3**  
**System Description – Flow Equalization Basin (SAFE System)**

Rather than a large, expensive, and high O&M cost Equalization Basin, the Filanc Black & Veatch team is proposing a different approach. Instead, peak flows above the capacity of the MBR system will automatically be processed with a primary filtration system. We are calling this the Stormwater Adaptive Filtration Equipment (SAFE) System.

**Key Overall Facility Features**

- SAFE System Diversion Box included at headworks to divert any flows in excess of the MBR capacity to the SAFE system for treatment.
- 1 SAFE System Unit
  - 1 disk backwash pump
  - 1 sludge pump
  - Cloth media disks for BOD removal and filtration
  - Scum box for scum removal
- In lieu of a large equalization basin, the SAFE System takes excess flows from the main treatment train and treats them for ocean discharge.
- Effluent is blended with MBR effluent to meet discharge permit requirements
- Manufacturer: Aqua-Aerobic Systems Inc., Veolia, or equal.

**Equipment – SAFE System .**

- 1 @ 6.26 mgd each (plant peak hour flow of 8.14 mgd less MBR capacity of 1.88 mgd).
- Stainless Steel tank to house disks and appurtenances.
- 1 backwash pump, approx. 51 ft TDH
- 1 solids pump, approx. 51 ft TDH
- Backwash and solids pumps will be interconnected to allow either to be used for either operation in event one pump is out of service.
- Electrically actuated plug valves to control sludge, scum and backwash operations and control appurtenances
  - Pressure transducer
  - Float Switch
  - Vacuum transmitters

**Attachment E, Proposal Form 3**  
**System Description – Flow Equalization Basin (SAFE System)**

**Control Features**

- Local control panel by SAFE System manufacturer with Plant PLC start/stop and monitoring.
- Flow from headworks through influent flow meter automatically triggers the startup of the SAFE system.

**Variations from PCR**

- SAFE System is provided in lieu of influent equalization tank with mixers, aeration, gates, odor control, etc.
- With the SAFE system included, the design the fine screens and BNR/MBR systems do not need to be sized for the equalized peak day flow. These components are sized instead for 1.88 mgd based on the finished water production requirements and blending requirements of the SAFE system effluent. In the event the flow exceeds the MBR capacity, it will pass through the SAFE system. The SAFE system effluent will blend with MBR effluent to meet ocean outfall permits.
- With the SAFE system, the Ocean Outfall pumps need to be sized to handle 6.26 mgd and up to 8.14 mgd in situations where the RO System is offline.

**Attachment E, Proposal Form 3**  
**Operations Description – Flow Equalization Basin (SAFE System)**

**Purpose**

Flows in excess of the treatment plant design capacity are diverted to the SAFE system for treatment.

**Description**

The SAFE facility is a cloth media filtration system that provides primary treatment for wet weather applications. The disks are constructed of a pile cloth filtration media to effectively filter high solids waste streams without the use of chemicals under varying influent conditions.

**Normal Operation**

**Operation**

As needed. Flow from headworks through influent flow meter initiates the SAFE system startup.

***Filtration Mode***

Screened wastewater flow enters the filter by gravity and fill basin that contains stationary cloth media disks that are completely submerged. Solids deposit on the outside of the cloth media forming a mat as filtrate flows through the media. The tank liquid level rises as headloss builds due to the collection of solids. Filtrate is collected in the hollow center tube and discharged over an effluent weir. The heavier solids settle into a hopper located in the bottom of the tank.

***Backwash Mode***

Solids are backwashed at a preset liquid level or time. Backwash shoes directly contact the cloth media and solids are removed by vacuum pressure using a backwash pump. The disks rotate slowly and two disks are backwashed at a time. Filtration is not interrupted. Backwash water is directed to the plant drain.

***Solids Wasting Mode***

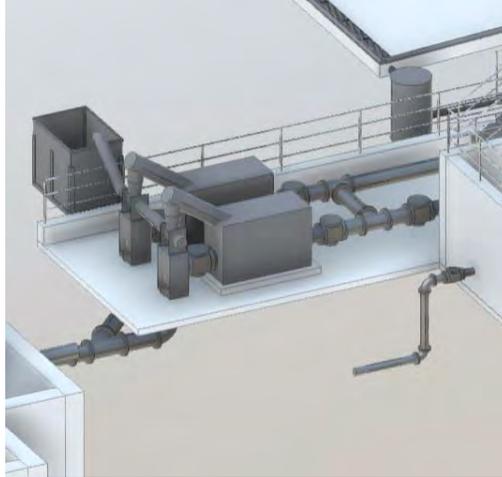

Heavier solids are removed from the collection on an intermittent basis. Filter Solids Waste Pump. Solids are pumped back to the Headworks Splitter Box.

***Floatable Wasting Mode***

Floatable scum is allowed to collect on the water surface. After a preset number of backwashes, the water level is allowed to rise above the preset high level and the scum flows over the scum removal Weir. Scum wasting water is directed to the plant drain.

THIS PAGE LEFT BLANK INTENTIONALLY

## Attachment E, Proposal Form 4 System Description – Fine Screening

Two packaged fine drum screen units are furnished in the Headworks Area to screen wastewater influent ahead of the MBR process.

### Key Overall Facility Features

- Fine screens are supplied from the SAFE System Diversion Box. An automated flow control valve and meter is included to regulate flow to the fine screens to the MBR treatment rate. A manual bypass valve is furnished in event the flow meter or control valve are out of service.
- Two Packaged Fine screens with integrated washer/compactors.
- Conveyor to convey screenings to dumpster.
- Manufacturer: Kusters Zima, Huber, Smith & Loveless, or equal.

### Equipment - Fine Screens

- Perforated plate drum screens in stainless steel tank with packaged washer/compactors.
- 2 unit @ 1.88 mgd each. 1 duty / 1 standby.
- 2 mm openings, 316 stainless steel.
- Furnished by fine screen manufacturer as part of package unit.

### Equipment - Washer/Compactor

- 2 units total, one integrated into each fine screen package.
- 316 stainless steel wetted components.
- 50% weight and volume reduction of screenings.
- Furnished by fine screen manufacturer as part of package unit.

### Equipment - Conveyor

- 1 unit, shared between both screening and washer/compactor units.
- Screw-auger conveyor
- 316 stainless steel wetted components.
- Discharge to dumpster. Dumpster area can accommodate a 20-yard dumpster. A 4-yard is anticipated for weekly disposal based on published debris loading rates. Dumpster to be provided by hauling company.
- Furnished by fine screen manufacturer as separately installed equipment.

**Attachment E, Proposal Form 4**  
**System Description – Fine Screening**

**Control Features**

- Local control panel by screen manufacturer with Plant PLC start/stop and monitoring.
- Operators manually select which unit(s) operate and leave them running continuously.
- Local control panel initiates operation of screen drum, washer/compactor, and conveyor.
- Control valve utilizes flow meter to maintain the MBR treatment flow capacity, maximum flow of 1.88 mgd through the fine screens. The valve is controlled directly by the Plant PLC and can be remotely or manually set to a position. A manual bypass valve is also furnished.

**Variations from PCR**

- Two fine screen units each rated at 100% of required capacity are furnished instead of three units each rated at 50% of required capacity as listed in the PDR. This simplifies the system while providing equivalent or greater redundancy.
- The fine screens are being furnished with a maximum flow of 1.88 mgd instead of 2.75 mgd equalized maximum day flow. This is due to the inclusion of the SAFE system for treating peak flow events.

**Attachment E, Proposal Form 4**  
**Operations Description – Fine Screening**

**Purpose**

Splitter Box flow is discharged to the fine screens through two lines. Trash and fibrous materials such as hair and paper found in domestic wastewater can hinder membrane performance and shorten membrane life. Fine screening captures these materials to prevent them from accumulating on the membranes and transfers the material to the conveyor and discharge chute and into the screenings container.

**Description**

The fine screen is comprised of perforated plate with an integrated screenings press and screenings washing. Floating and suspended materials are retained by the screen basket. Blinding of the screen surface generates an additional filtering effect so that solids can be retained that are smaller than the bar spacing or perforation.

The screenings and compactor local control panel (LCP) is energized from the MCC. With the control selector switch in the Hand position the screen runs continuously; in the Off position the screen does not rotate; in Auto control is passed to PLC and operation set through SCADA. Screen operation is set on the SCADA configuration screen including control mode (Remote Manual | Remote Auto), screen out of service and screen high level setpoint. Selecting a screen has out of service removes the equipment from the control loop and suppresses any alarms.

Water level is measured upstream and downstream of each screen. The basket starts to rotate when a preset upstream water level is exceeded due to screen surface blinding. The rotating screen drum lifts the screenings and drops them into the centrally arranged trough. Screenings removal from the drum is supported by a scraper brush and a spray nozzle bar. Plant effluent water (PEW) is supplied by a solenoid valves. In the event PEW pressure is low a pressure switch generates an alarm. A screw conveyor in the trough rotates with the drum and transports the screenings through a closed and inclined pipe. The conveying screw transports, dewateres and compacts the screenings, without any odor nuisance, and discharges them into the dumpster. Screened wastewater is combined in a pipeline that discharges to the MBR. Sodium hydroxide is added to the line for pH control and monitored for TSS and pH. An E-stop is located locally and the LCP. Energizing the E-Stop shuts down the equipment immediately and generates an alarm.

Specifics on the sodium hydroxide feed system are located in Att E-Proposal Form 10-Chemical Storage and Feed.

**Normal Operation**

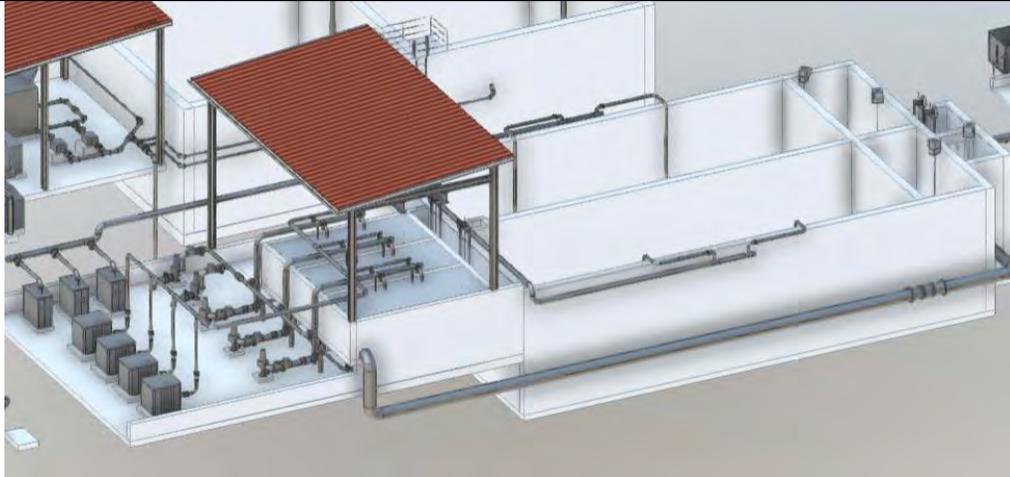

One fine screen runs in Remote Auto. One unit shall be operated when the MBR is in service.

**Abnormal Operation**

- Fine Screen No. 1 shall be operated in Remote Manual.
- Fine Screen No. 1 shall be operated in Hand.
- Fine Screen No. 2 shall be placed in service. Open the manual supply and out let valves to Screen No. 2. Energize the LCP and place controls in in Auto. Inlet and outlet valves to Screen No. 1 should be shut. If possible run the screen to remove as much material as possible. Place Screen No. 1 controls in Off.

THIS PAGE LEFT BLANK INTENTIONALLY

**Attachment E, Proposal Form 5**  
**System Description – Membrane Bio-Reactor**

A Biological Nutrient Reduction System with a Membrane Bio-Reactor is furnished to perform BOD and nutrient removal along with filtration ahead of advanced treatment with RO or discharge to the ocean.

**Key Overall Facility Features**

- Two BNR process trains each with ability to treat max month flow of 1.16 mgd of screened and dewatered wastewater with full redundancy. Max day flow of 1.88 mgd will utilize both basins. BNR does not need to be sized to handle 2.75 mgd equalized maximum day flow because the SAFE system handles peak flows rather than requiring them to be processed with MBR.
- MLSS will be less than 8,000 mg/l in BNR basins and less than 10,000 mg/l in MBR tanks.
- BNR basins utilize cast-in-place concrete construction with 18-ft sidewater depth.
- Total anoxic volume of 60,000 gallons. 30,000 gallons per train. Anoxic volume in each train divided into two zones.
- Total aerobic volume of 420,000 gallons. 210,000 gallons per train. Aerobic volume in each train served by two diffuser grids.
- 1.5 ft of in-basin equalization volume (anoxic and aerobic) for a total volume of 26,670 gallons.
- BNR process air supplied by single-stage, high-speed turbo blowers. Blowers are on Adjustable Frequency Drives to allow optimization of air flow.
- Manual isolation gates for each treatment train.
- RAS deox volume of 10,000 gallons total furnished in the RAS pipe Deox Tank upstream of BNR inlet splitter.
- Membrane Bioreactor System including:
  - Membrane cassettes and supporting structures.
  - Membrane filtrate pumps.
  - Membrane backpulse pumps. *(if required by system supplier)*
  - Membrane filtrate collection / backpulse distribution headers.
  - Membrane tank drain pumps. *(if required by system supplier)*
  - Membrane scour air blowers.
  - Membrane scour air distribution headers.
  - Valves, instrumentation, and controls equipment for operation of MBR system.
  - Compressed air system for operation of MBR equipment. *(if required by system supplier)*
  - Clean-in-place system via injection of citric acid or sodium hypochlorite into back pulse

**Attachment E, Proposal Form 5**  
**System Description – Membrane Bio-Reactor**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Attachment E, Proposal Form 5 System Description – Membrane Bio-Reactor

### Equipment – Membrane Filtration System (specific equipment package subject to change based on MBR System Supplier requirements)

- 1.0 mgd annual average, 1.16 mgd max month, and 1.88 mgd max day treatment capacity. 10 gfd at annual average flow and 17 gfd at max month flow.
- *Three membrane trains. 650 gpm each.*
- Membrane Cassettes
  - 2 per MBR train.
  - Integrated scour air distribution.
- Membrane Filtrate Pumps
  - 3 @ 675 gpm, 30ft TDH.
  - Vertical centrifugal pumps
  - Manufacturer selection by MBR Supplier.
- Membrane Backpulse Pumps
  - 2 @ 675 gpm, 30ft TDH. 1 duty / 1 standby.
  - Vertical centrifugal pumps
  - Manufacturer selection by MBR Supplier.
- Membrane Tank Drain Pumps
  - 2 @ 250 gpm, 15ft TDH. 1 duty / 1 standby.
  - Vertical centrifugal pumps
  - Manufacturer selection by MBR Supplier.
- Membrane Scour Air Blowers
  - 4 @ 270 scfm, 6 psi. 3 duty / 1 standby.
  - Rotary lobe blowers w/ weather enclosure.
  - Manufacturer selection by MBR Supplier.
- Compress Air System
  - Complete with dryers, receiver tank, and control equipment.
  - Capacity requirements by MBR Supplier.
- Connections on MBR Supplier provided piping to accommodate CIP chemicals.

### Control Features

- BNR Process Blowers
  - Local Control panels with Blower Master Control panel communication to SCADA.
  - System supplies/controls air based on DO control within aeration zones.
- MBR System
  - Local Control panels with MBR Master Control panel communication to SCADA.
  - Control of all MBR Supplier provided equipment is within the scope of Supplier.
- Anoxic/Deox Mixers
  - Operators manually select which unit(s) operate and leave them running continuously.
- RAS Pumps
  - Operators manually select which unit(s) operate and leave them running continuously.
  - Pump speed to be varied based on filtrate flow.
- WAS Pumps
  - Wetwell level control. Lead/lag selectable by Operator.

**Attachment E, Proposal Form 5**  
**System Description – Membrane Bio-Reactor**

- Post-MBR WAS wasting valve duration and frequency Operator definable in SCADA.
- WAS/Scum Collection Rotating Pipe Weirs
  - Operator definable duration and frequency in SCADA.

**Variations from PCR**

- MBR system is being designed with a capacity of 1.88 mgd rather than 2.75 mgd as listed in the RFP. This change is one of the benefits of Filanc Black & Veatch’s innovative SAFE Systems approach to handling peak flows. Approximately 10,000 gallons of equalization volume is furnished within the BNR tanks to ease operations during daily diurnals, in particular minimum day diurnals, as requested by the City in the Proprietary Meeting.
- MBR cassette removal monorails provided in lieu of a bridge crane for simplicity and lower capital cost.
- Blowers and compressor equipment are not located in a Process Building. Sound/weather enclosures will be provided to allow equipment to operate outside.
- Scour blower selection will be by the MBR System Supplier and therefore may not meet all of the stated criteria for blower efficiency or allowable manufacturers.
- CIP will utilize MF filtrate, not RO permeate. This is industry standard practice and there is no process benefit to using the higher cost RO product.

**Attachment E, Proposal Form 5**  
**Operations Description – Membrane Bio-Reactor**

**Purpose**

The MBR Area contains processes that accomplish secondary treatment and filtration. The purpose of the area is to convert dissolved and colloidal material to a product that can be separated from the liquid stream and to create an effluent (called permeate) suitable for the RO Facility.

Air is drawn through a set of filters to remove particulate matter,

**Description**

**Biological Reactor**

Wastewater that has passed through the fine screens and return activated sludge (RAS) flows are combined at the Bioreactor Splitter Box. An oxygen reduction probe (ORP) is located in box and provides an indication of the environmental condition of the biomass (aerobic, anoxic, and anaerobic). Using manually operated gates the flow can be directed to either activated sludge (AS) train. Flow is directed over a weir into the anoxic (AN) zone. The zone is mixed gently to encourage contact between food and the biomass. In an anoxic environment the biomass uses combined oxygen (nitrate) as an energy source. This is an effective way to convert nitrate to nitrogen gas and reduce overall nitrogen. The anoxic zone denitrifies the RAS before the mixed liquor (ML) flows into the aerobic zone. The AS system is configured for nitrification and denitrification. Solids are held in the aeration basins for a period of time that allows carbonaceous BOD removal as well as conversion of ammonia to nitrate. . A ML probe is located at the end of the aeration basin to monitor suspended solids concentration. The filtered wastewater, called permeate, is transferred to the RO Feed Tank.

**Aeration Blower**

The blowers will be used to compress air for injection into the aeration basins to maintain aerobic biological activity. Each blower will be equipped with inlet guide vanes, variable diffuser vanes, and a control system to optimize efficiency. Vanes will modulate based on process requirements and ambient conditions. Temperature detection will be provided for each blower. Pressure will be monitored on both the suction and blower discharge lines. A discharge electric isolation discharge valve will be provided for each blower. Aeration air pressure is measured at the blower aeration air manifold and is used in blower control. Meters are provided on each aeration basin dropleg to the fine bubble diffusers. Dissolved oxygen (DO) and ORP\temperature probes are located in the aerobic zone. The DO probes are also used as a control element blower operation to maintain a DO setpoint

**Scum/Foam Control**

Floating solids are periodically removed from the aeration basin surface using the rotating weir located at the end of the basin. The material will be transferred to the WAS Wetwell. This prevents foam from accumulating in the system.

**WAS**

The WAS Wetwell receives scum from the aeration basins and a portion of RAS that is diverted to the WAS to control sludge retention time (SRT). An electrically controlled valve is used isolate wetwell inlet. Two submersible pumps transfer WAS sludge to the aerobic digesters. WAS pump flowrate is adjusted as needed to maintain the require SRT. Pressure gauges are located on the discharge of each pump. The pumps discharge to a common manifold that is metered.

**MBR**

## Attachment E, Proposal Form 5 Operations Description – Membrane Bio-Reactor

Mixed liquor effluent flows from the AS plant to the ML Collection Channel which is equipped with a RAS Pump transfer biomass into the MBR. A level switch is located in the channel that is activated should the channel level reach the high-high setpoint. The biomass flows over a weir and into the MBR where the membranes are located. The membranes filter the inorganics and organics larger than the membrane pore size and provide a degree of pathogen removal. The membranes are used to provide a portion of the disinfection and aid in removing some organics that contribute to disinfection byproducts.

### Scour Air Blower

Each MBR cassette receives a continuous air flow to maintain an aerobic environment. Air is supplied by membrane scour blowers. Ambient air is compressed through the blowers and then discharged through piping to each MBR cassette. MBR level is continuously monitored, displayed locally and transmitted to SCADA. Discrete level sensors are used to generate alarms for high-high and low-low levels. Operating outside of these levels could adversely impact MBR operation.

Solids that slough off the membranes are drawn from the aeration basins. A portion of the solids are removed from the system through the WAS pumps and transferred to the solids area for aerobic digestion and subsequent dewatering. Most of the MBR solids are returned to the AS system via the DeOx Tank. The tank is mixed gently without the addition of any food. The purpose of the tank is to remove free oxygen from the biomass. The deoxygenated biomass is discharged into the AN basin influent where it is blended with screened and degritted wastewater.

### Membrane Cleaning Options

Biological fouling occurs when aerobic and anaerobic bacteria, fungus, and algae colonize on the membrane surface and begin growing. Precipitative fouling is the scale formation when compounds in the wastewater are concentrated beyond their solubility. Precipitative fouling usually does not occur in the membranes unless the wastewater has a high pH combined with hard water. Adsorptive fouling occurs when oil, polymers, surfactant, and hydrocarbons adhere to the membrane surface and clog the membrane pores. Cake formation (sludging) occurs when the membranes accumulate solids between the membrane fibers that do not allow wastewater to reach the membrane surfaces.

Cleaning options are described below

#### a. Membrane Backwash System

The backpulse system supplies water forced through the lumen (inside) of the membrane fiber to the outside surface. The water flushes any material (foulant) that has accumulated on the membrane surface, and flushes it into the membrane basin. A backpulse pressure of 10 psi and a flow rate one and a half times the production flow are applied to the membranes every 15 minutes for 15 seconds (these times are Operator adjustable). The backpulse water remains in the basin and is filtered as ML.

#### b. Clean in Place (CIP)

Two types of CIP cleans are used on the membranes to deep clean the membranes when the TMP increases to 12 psi or the membrane recovery is lower than a predetermined value.

#### Maintenance CIP Clean

The **maintenance clean** uses a low dosage (100 mg/L, which dilutes to 10 mg/L in the basin) of sodium hypochlorite, and the chemical is backpulsed through the membranes (inside to outside) into the basin. The membrane basin remains full during the maintenance clean. The membrane control

**Attachment E, Proposal Form 5**  
**Operations Description – Membrane Bio-Reactor**

system then cycles to a relaxation mode to soak the membranes for 1 to 5 minutes (Operator preset time). The membranes then cycle into the production mode, and the basin content is filtered as normal. The maintenance clean is performed every 24 hours, and is completed with the membrane basin full of water

***Recovery CIP Clean***

The ***recovery clean*** is run every 3 weeks or at determined intervals based on operational experience. The recovery clean can use either sodium hypochlorite or citric acid. The sodium hypochlorite dissolves and removes organic materials and citric acid dissolves and removes inorganics that have fouled or blocked the membranes. Sodium hypochlorite is fed at 10,000 mg/L or 1 percent solution concentration; citric acid is fed at 1,000 mg/L. Softened water is used and the water is heated prior to the CIP clean to increase the efficiency of the chemical if needed in the cleaning process.

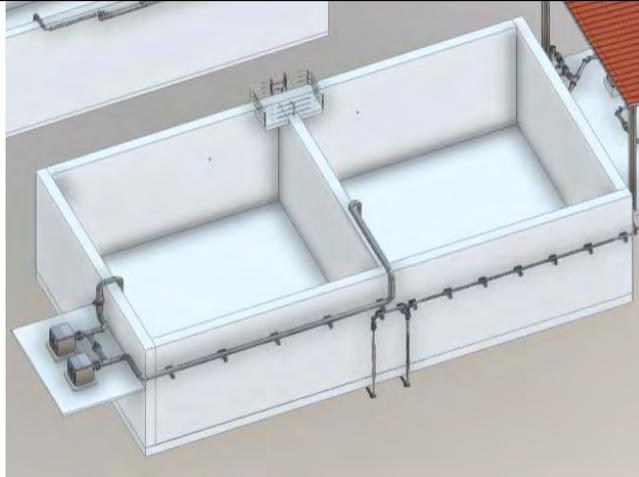

The recovery clean is performed with the membrane basin empty. The CIP pump draws water from the softened water storage tank. As the water is drawn from the softened water tank, sodium hypochlorite or citric acid is fed into the CIP pump discharge and backpulsed into the membranes. The backpulse carries the specified chemical from the inside of the membrane fiber to the outside at the full concentration. The backwash pumps then fill the membrane train/basin with potable water from the finished water reservoir; the water is then transferred through the membrane fill line to the specified train. The water in the basin dilutes the chemical concentration; the membranes soak in the chemical water in the basin for 4 hours before the water goes to the next train or ends the clean. The membrane train/basin water is drained and sent to the CIP disposal basin or transferred to the next membrane train that undergoes the following cycled recovery clean. The membrane train/basin water may be transferred and used in four recovery cleans before being diverted to the CIP disposal basin. Operational experience determines the recovery clean basin water recycle.

**Normal Operation**

The MBR equipment normally operated in Remote Auto. The ML will be less than 8,000 mg/l in BNR basins and less than 10,000 mg/l in MBR tanks.

THIS PAGE LEFT BLANK INTENTIONALLY

**Attachment E, Proposal Form 6**  
**System Description – Aerobic Sludge Digester**

A two-zone aerobic sludge digester / WAS holding tank are provided to store and aerate WAS sludge. Each zone is designed to operate independently, and it is expected that normally only one zone will be in use to minimize sludge age for optimization of dewatering system performance. Each zone includes a mixer to mix the WAS sludge and coarse bubble diffusers to aerate it.

**Key Overall Facility Features**

- Two cell concrete tank with ability to store 14 days of sludge at AAF conditions with 1.15 safety factor built into tank volume – sidewater depth of 20.7 feet
- Tank is divided into two cells to allow operators to use half the volume for normal operations. In general, it is recommended to minimize sludge storage time.
- Access platform at the top of the tank for mixer maintenance.
- Influent and effluent isolation to tank.
- Isolation valves above ground to bypass tank and send straight to dewatering system.
- Two aeration blowers are included directly adjacent to tank to improve blower efficiency.

**Equipment – Blowers**

- 2 @ 700 scfm each. 1 duty / 1 standby
- Supplies air to coarse bubble diffuser grids
- Manufacturer: Kaeser Compressors, Universal Blower Pac, or equal.

**Equipment – Coarse Bubble Diffusers**

- 2 grids, one per cell of digester
- 304L stainless steel
- Manufacturer: DI, Sanitaire, or equal.

**Equipment – Mixers**

- 2 provided, one in each cell, to alternate with aeration in order to keep solids mixed.
- 10 hp each
- Manufacturer: Sulzer, Flow Systems, Flygt, or equal.

**Control Features**

- Local control panel by blower manufacturer with PLC start/stop and monitoring.
- Plant PLC turns blowers on/off are based off time and level to promote denitrification and alkalinity management.

**Attachment E, Proposal Form 6**  
**System Description – Aerobic Sludge Digester**

- Plant PLC turns mixers on/off to provide sludge mixing when blowers are off or continuously if operators select.
- Operators manually select which unit(s) and tank(s) operate and leave them running continuously.

**Variations from PCR**

- None.

**Attachment E, Proposal Form 6**  
**Operations Description – Aerobic Sludge Digester**

**Purpose**

The aerobic digesters are aerated tanks hold sludge wasted from the MBR. The tanks act as a reservoir for feed sludge to the belt press and provide some stabilization of biomass as aerobic digesters.

**Description**

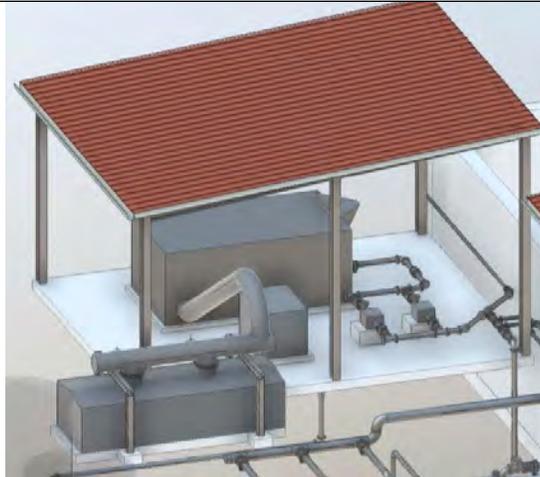

The facility is designed to operate the belt press two days a week. The sludge holding tanks act as a reservoir for sludge that feeds the belt press. The tank is aerated using diffusers to keep the environment oxic for aerobic and facultative bacteria. The microorganisms use the oxygen and obtain energy from incoming organic matter in the WAS. When the food supply is limited the microorganisms consume their own protoplasm to satisfy their energy requirements. Eventually the cells undergo lysis and release degradable organic matter which is then available for other microorganisms and biologically destroys volatile solids. The digester freeboard/head space will be minimized to reduce potential for odor accumulation. A mixer is located in the tanks and can be used to lift solids from the bottom of the tank.

**Normal Operation**

MBR waste active sludge is continuously sent to the sludge holding tanks. The blower runs as required to maintain an aerobic environment in the tanks. The mixer can be operated only when the aeration is off, or continuously as required to keep WAS sludge mixed.

THIS PAGE LEFT BLANK INTENTIONALLY

**Attachment E, Proposal Form 7**  
**System Description – Sludge Dewatering**

A belt filter press sludge dewatering system is furnished to dewater aerated WAS sludge down to a water content suitable for hauling and disposal. Belt filter press technology was selected over a screw press because screw press manufacturers will not guarantee the solids concentration needed by the City.

**Key Overall Facility Features**

- 1 Belt Filter Press to be operated 2 days per week, 8 hours per day.
- 1 Conveyance System to convey dewatered solids to a 40 yard roll-off container (container provided by hauling company).
- 1 dual-port dumpster conveyor system to selectively distribute dewatered solids in the dumpster. Furnished with cover to minimize odor release.
- 2 rotary lobe pumps to feed the belt filter press either from the aerobic digester tank or directly from the WAS pipe.
- Polymer storage and feed equipment provided directly adjacent to belt filter press.

**Equipment – Belt Filter Press**

- 1 unit
- Minimum guaranteed dry solids concentration: 17%
- Solids flow: 1,313 lbs/hour.
- Liquid flow: 305 gal/min.
- Polymer system provided in Chemical Storage and Feed Form.
- Manufacturer: Komline-Sanderson, BDP, Charter Machine Company, or equal.

**Equipment – Rotary Lobe Feed Pumps**

- 2 (1 duty, 1 standby).
- Capacity: 305 gal/min ea.
- Manufacturer: Borger, Netzsch, or equal.

**Equipment - Conveyor**

- 1 angled conveyor to lift solids from belt filter press up to dumpster distribution conveyor.
- 1 horizontal conveyor with 2 electric knife gate valves above dumpster to distribute dewatered solids evenly.
- Manufacturer: JDV, Custom Conveyor Corporation, or equal.

**Attachment E, Proposal Form 7**  
**System Description – Sludge Dewatering**

**Control Features**

- Local control panel by dewatering equipment manufacturer with Plant PLC start/stop and monitoring.
- Dewatering equipment local control panel will communicate for coordinated operation with polymer feed system and sludge feed pumps.
- Knife gate valves on dumpster conveyor are motorized with operators manually selecting which to open in order to distribute dewatered solids.

**Variations from PCR**

- Instead of a dumpster-veyor type system to distribute solids in the dumpster, a dual-port conveyor system is furnished. This system allows operators to select which half of the dumpster to load solids into. This system includes splash guards and covering to minimize odor release. This is a common system for distribution of solids of this concentration into a dumpster for hauling and provides a better cost value to the City.

## Attachment E, Proposal Form 7 Operations Description – Sludge Dewatering

### Purpose

The dewatering system dewateres aerobically digested sludge to reduce the moisture content so that it can be handled as a dry cake instead of a liquid. Cake is dropped onto a conveyor which transports the cake to a dumpster for temporary storage. Water removed from the sludge is called filtrate and drains to the sewer. The dewatered sludge product weighs less which reduces transport and ultimate disposal costs to reuse sites.

### Description

#### *Belt Press Feed Pumps*

Two dewatering sludge pumps each equipped with variable frequency drive (VFD) drives transfer stabilized sludge from the aerobic digesters to the belt press. Pressure is displayed locally on the pump suction and discharge. In the event of low suction pressure or high discharge pressure the dewater pump shuts down. Prior to pump start up the seal water low pressure switch must not be energized. The pumps discharge to common discharge line where the flowrate is measured, displayed locally and transmitted to the PLC. Polymer is added to the sludge feed as a coagulant to enhance coagulation. Dosage is based on the sludge feed rate and is set through SCADA.

Once pumps and VFDs are energized the pumps are controlled using the local control panel (LCP). With the control selector switch in the Hand position the pumps run continuously with the speed set manually at the VFD. In the Off position the pumps do not run. In the Remote position power is transferred to the PLC and the SCADA interface used to set controls. In Remote Auto the BFP LCP controls pump operation.

#### *Polymer Feed System*

Refer to Att E-Proposal Form 10-Chemical Storage and Feed for details on the Polymer Feed System.

#### *Belt Filter Press*

Sludge is transferred from the aerobic digester to the belt press using rotary lobe pumps. The belt press consists of a drive, gear reducer, a set of two continuously moving permeable belts, hydraulic system, belt wash system, and associated controls. Polymer is used as a coagulating agent to help release water from the sludge. Polymer is added to the feed pump discharge line prior to discharge onto the press.

The dewatering LCP controls dewatering operating using a control selector switch. In the On position the dewatering system starts by starting the cake conveyors and opening the dumpster gates. The plant service water (PSW) solenoid valve opens to supply the two belt press washwater boxes. The drive motors start which moves the belts through the wash boxes to wet the belt. The PSW line has a low pressure switch that shuts down the belt press in the event there is insufficient water pressure to clean the belts. The polymer feed system is then called to operate (the polymer metering pump must be in Auto control). The conditioned sludge is discharged onto the upper belt in the gravity drainage section. The sludge is evenly distributed onto the belt through an inlet distribution assembly. The sludge is retained in this section by rubber-edged guide plates. A series of plows promotes sludge dewatering by constantly turning over the sludge to expedite water drainage and ensure even distribution across the entire width of the belt filter. The belt over this section is supported on a fixed plastic grid. Initial dewatering takes place by the water draining through the sludge mass and belt. The drainage is collected in a separate trough, located under the belt. The dewatering system does

## Attachment E, Proposal Form 7 Operations Description – Sludge Dewatering

not run if the control selector switch is in the Off position. An Estop is also located on the Dewatering LCP and will stop the dewatering option if the button is pushed.

The partially-dewatered sludge is transported to the vertical dewatering zone. The tapered V-shaped vertical chamber, which has a variable opening, is formed by the two downward-moving belts. The end walls are formed by two flexible seals, covered by a low friction plastic strip and fixed to the frame of the press. In this vertical zone, each band is supported by rigid perforated plastic grids over which the belts slide. The two belts move from the vertical zone and pass around a large perforated drum fitted with internal scoops which carry the filtrate outwardly. The filtrate passes from the inner surface of the belt/sludge sandwich to discharge ports on one end of the drum.

The sludge is contained between the two belts and travels between a series of shear-producing rollers where additional water is released due to increasing pressures. The water is drained into a collection trough. All of the rollers are of the freely rotating type, except the last one which is the drive roller. After passing over this roller, the belts separate. Spring-loaded scraper blades are provided to separate the cake from the belt at the point of cake discharge. The cake drops onto the inclines conveyor

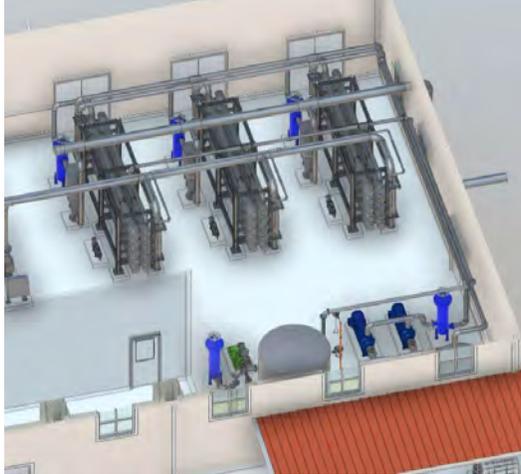

### Cake Conveyance

An inclined screw conveyor transports cake to the dual-port dumpster distribution screw conveyor. Motorized gates are located on the bottom of the shaftless conveyor that permits the cake to fall into the dumpster. Each conveyor is controlled from a LCP using a control selector switch. In the Local position the conveyors are controlled using Start and Stop switches; in Off the conveyors do not run; in Remote position control is passed to the PLC and operation set through the SCADA interface. In Remote Auto the conveyors are controlled as part of the dewatering start and stop sequence.

### Normal Operation

The belt press runs continuously for the duration of the sludge processing event. The belt press, sludge feed and polymer feed system operate in Remote Auto through the Master Control Panel. The automated startup and shutdown sequences for the components are managed by the MCP. The polymer dosage and belt speed are adjusted by the Plant Operator.

## Attachment E, Proposal Form 8 System Description – Reverse Osmosis System

A reverse osmosis system is furnished to remove dissolved solids, bacteria, and some viruses as the primary treatment step for turning MBR filtrate into water suitable for indirect potable reuse. The system is furnished within a building complete with CIP and Flushing systems.

### Key Overall Facility Features

- RO Feed Tank 30,000 gallons
- Three duty RO units sized with a permeate capacity of 215 gpm per unit to produce a total RO permeate volume of 825 AFY.
- Average element flux < 12 gfd; single element flux < 16 gfd
- Recovery: Design = 80%, Minimum 75%, Maximum 85%
- RO System including:
  - RO high pressure feed pumps, motors, and AFD's dedicated to each unit
  - RO units
  - RO sampling lines and sample sink
  - Clean in place (CIP) system and flushing system including tanks, pumps, motors,
  - Neutralization system.
  - RO Inter-stage booster pumps, motors and AFDs.
  - Instrumentation and control system
  - Cartridge filters and cartridge filter elements.
- Manufacturer / System Supplier: H2O Innovation USA, Inc. Suez, Wigen Water Tech, or equal.

### Equipment – RO Units

- 3 duty @ 215 gpm design permeate flow rate per unit.
- Number of Stages per Unit = 2
- Number of RO elements per pressure vessel = 7.
- Number of Stage 1 pressure vessels = 7
- Number of Stage 2 pressure vessels = 3
- Manufacturer: Selected by System Supplier.

**Attachment E, Proposal Form 8**  
**System Description – Reverse Osmosis System**

**Equipment – RO High Pressure Pumps**

- 1 duty dedicated per RO unit.
- Vertical turbine.
- AFD drive.
- Operating capacity 202 gpm to 287 gpm
- NPSHa = 30 ft
- Motor Power (to be provided by ROSS)
- Manufacturer: Selected by System Supplier.

**Equipment – RO Inter-Stage Booster Pump**

- 1 duty dedicated per RO unit.
- Minimum rated head = 50 psi.
- Pump type (selected by ROSS). Anticipated to be end-suction centrifugal or vertical turbine in can.
- AFD drive.
- Manufacturer: Selected by System Supplier.

**Equipment – RO CIP Tank**

- 1 tank, vertical cylindrical, dome top, flat bottom, FRP, minimum usable storage volume 900 gallons
- 1 tank heater, sized to heat the temperature of the CIP solution 10 °C in 3 hours.
- Manufacturer: Selected by System Supplier.

**Equipment – RO Neutralization Tank**

- 1 tank, vertical cylindrical, dome top, flat bottom, FRP, minimum usable storage volume 1,800 gallons or one acid or base cleaning solution volume including one volume of flush water. 900 gallons.
- 1 tank heater, sized to heat the temperature of the CIP solution 10 °C in 3 hours.
- Manufacturer: Selected by System Supplier.

**Equipment – CIP Recirculation Pumps**

- 2 @ 350 gpm, 140 ft TDH. 1 duty / 1 standby.
- Horizontal end suction centrifugal pump.
- Manufacturer: Selected by System Supplier.

**Equipment – RO Flush Tank**

- 1 tank, vertical cylindrical, dome top, flat bottom, FRP, minimum usable storage volume 2,300 gallons
- 1 tank heater, sized to heat the temperature of the CIP solution 10 °C in 3 hours.
- Manufacturer: Selected by System Supplier.

**Equipment – RO Flush Pumps**

- 2 @ 210 gpm each, 140 ft TDH. 1 duty / 1 standby.
- Horizontal end suction centrifugal pump.
- Manufacturer: Selected by System Supplier.

**Attachment E, Proposal Form 8**  
**System Description – Reverse Osmosis System**

**Equipment – RO Feed Cartridge Filter Vessels**

- 3 cartridge filter vessels, 300 gpm design capacity, 316 SS (1 per RO unit).
- Horizontal or vertical vessel orientation
- Maximum loading rate @ design flow rate = 3.5 gpm per 10 inch equivalent length
- Maximum clean element head loss @ design flow rate < 3 psi
- Maximum dirty element head loss @ design flow rate = 15 psi
- Manufacturer: Selected by System Supplier.

**Equipment – RO CIP Cartridge Filters**

- 3 cartridge filter vessels, 300 gpm design capacity, 316 SS (1 per RO unit).
- Horizontal or vertical vessel orientation
- Maximum loading rate @ design flow rate = 3.5 gpm per 10 inch equivalent length
- Maximum clean element head loss @ design flow rate < 3 psi
- Maximum dirty element head loss @ design flow rate = 15 psi
- *Manufacturer Parker Hannifin Corp., 3M, Pall or equal.*
- Manufacturer: Selected by System Supplier.

**Equipment – RO Flush Cartridge Filters**

- 1 cartridge filter vessel, 180 gpm design capacity, 316 SS (1 per RO unit).
- Horizontal vessel orientation
- Maximum loading rate @ design flow rate < 5 gpm per 10 inch equivalent length
- Maximum clean element head loss @ design flow rate < 3 psi
- Maximum dirty element head loss @ design flow rate = 15 psi
- Manufacturer: Selected by System Supplier.

**Equipment – RO elements**

- 8 inch by 40", thin film composite, spiral wound
- Manufacturer: Selected by System Supplier. Anticipated to be DOW, Hydranautics, Toray, or equal.

**Equipment – RO pressure vessels**

- Fiber glass reinforced plastic
- Minimum pressure rating = 300 psi for operating temperatures (4.4 to 88 °C)
- Manufacturer: Selected by System Supplier.

**Control Features**

- The RO system shall be controlled by a PLC that is integrated into a Plant Control System.
- RO High Pressure Feed Pumps
  - Each high pressure pump (with AFD) shall be controlled to achieve a permeate flow set point of that RO unit (sum of the permeate flow from each stage of the RO unit).
- RO Units
  - RO units shall automatically be brought into and out of service to maintain a minimum level set point in the RO feed tank.
- Concentrate Control Valves
  - Each concentrate control valve shall be controlled to achieve a set recovery of that unit.
- Booster Pumps

**Attachment E, Proposal Form 8**  
**System Description – Reverse Osmosis System**

- Each booster pump shall be boost the pressure of the second stage feed to balance the flux between first stage and second stage by controlling the permeate flow of the first stage.
- Pre-Operative Feed Water RO Unit Bypass
  - Controls shall include a pre-operative bypass executed when the first unit is brought into service with all other units remaining offline. During this procedure cartridge filter effluent shall bypass all the RO units, allowing feed water parameters to stabilize at a set point and chemical flows to stabilize before feed water is admitted to the membranes.
- Post-Operative Feed Water RO Unit Flush
  - Controls shall include an automatic post-operative feed water flush cycle which shall be initiated automatically upon shutdown of the plant, unless the operator selected no feed flush option. The purpose of the post-operative feed water flush cycle is to ensure that concentrate is flushed from the membranes to prevent fouling of the membranes, corrosion and scale accumulation.
- Post-Operative Permeate RO Unit Flush
  - Controls shall include an automatic post-operative permeate flush cycle which shall be initiated automatically upon shutdown of the unit following a post-operative feed water flush cycle as selected by the operator. no feed flush option. The purpose of the post-operative permeate flush is to ensure that concentrate is flushed from the membranes to prevent fouling of the membranes during shutdown for extended periods of time.

**Variations from PCR**

- Average flux > 12 gfd during times when one RO unit is offline or unavailable for maintenance / cleaning, assuming 98% online factor.

**Attachment E, Proposal Form 8**  
**Operations Description – Reverse Osmosis System**

**Purpose**

The RO system is fed from the MBRs. Flow is received at the RO Feed Tank which stores MBR permeate. The Tanks may be bypassed and flow directed RO Feed Tank 2 or both tanks may be bypassed and flow directed to the Outfall Pump Station (OPS). ROP bypass flow is combined with the RO feed tank line that flows to the OPS Normally the tanks supply feed to the RO feed pumps. RO removes dissolved constituents from the influent water, which achieves permeate salinity control and additional pathogen log removal credits. The RO feed water is pretreated with cartridge filters to protect the RO membranes against damage from large particles. Finally, the water is pressurized and passed through three stages of RO membrane elements with a pressure boost before the third stage to achieve flux balance. RO permeate (ROP) is discharged to the UVAOP for disinfection.

**Description**

The RO system shall be controlled by a PLC that is integrated into a plant control system that operates the RO feed tanks, RO high pressure feed pumps, concentrate control valves , booster pumps, cartridge filters, CIP makeup and neutralization systems.

**RO Feed System**

The MBR permeate pumps discharge to the two RO feed tanks. The tank level is measured, displayed locally and transmitted to PLC. The tank has switches that are used to activate the High-High and Low-Low Levels.

Pump controls are set locally. With the control selector switch in the Local position the pump are operated using Start and Stop pushbuttons and the speed adjusted using a potentiometer; in the Off position the pumps to not run; in the Remote position control is passed to PLC. Pump pressure is displayed locally. Pump duty selection (lead, lag or set a put to be out of service) is set from the configuration screen. In the event the lead pump fails the lag pump is promoted to the lead pump role; the third pump is used as a standby pump. When a pump is selected as out of service the pump is taken out of the control loop. In Remote Auto the pump(s) start or stop and adjusts speed uniformly to maintain set distribution pressure. If distribution pressure continues to rise with one pump in operation at minimum speed, that pump will cycle off and allow the air-bladder tank to supply those low demands. The pump will automatically restart when distribution pressure dips indicating the air-bladder tank is not keeping up with demands. The pumps discharge to a common manifold where flow, discharge pressure and pH are measured, displayed locally and transmitted to PLC.

Sodium hypochlorite and antiscalent are added to the RO feed supply line. A locally mounted flow meter measures, displays and transmits to PLC. After chemical has been added a sample pump pulls a portion of the flow from the feed line and discharges it to the RO Feed Analytical Panel where conductivity, turbidity, ORP, chlorine, pH and sodium hypochlorite concentrations are measured, displayed and transmitted to the PLC.

**RO Membranes**

The RO high pressure feed pumps (with AFD) shall be controlled to achieve a permeate flow set point of that RO unit (sum of the permeate flow from each stage of the RO unit). One feed pump is dedicated to Stage 1 of each RO unit. The RO units shall automatically be brought into and out of service to maintain a minimum level set point in the RO feed tank. Concentrate control valves shall be

**Attachment E, Proposal Form 8**  
**Operations Description – Reverse Osmosis System**

controlled to achieve a set recovery of that unit. A booster pump is used to increase second stage feed flow to balance the flux between first stage and second stage by controlling the permeate flow of the first stage. Pressure is measured on the RO permeate (ROP) and RO concentrate (ROC). Conductivity is measured on the ROP of each stage, displayed locally and transmitted to PLC. The ROP flow rate is measured locally displayed and transmitted to PLC. Pressure is monitored locally, displayed and transmitted to PLC.

ROP pressure is monitored, displayed locally and transmitted to the PLC. In the event of high pressure a pressure switch generates an alarm at the PLC and an air vent release valve opens. A flow meter measures, displays and transmits the RO Unit ROP to PLC. ROP outlet piping three locations. During a normal operation ROP is directed to the UV system for disinfection through a flow control valve. Valve controls are set locally. In Local valve position is set using the Open and Close selector switch; in Remote control is passed to the PLC that controls the RO System. Flow not directed to the UV system is a split between the OPS and the RO CIP System. Note that RO train ROP to the outfall is combined in a single line to the OPS.

ROC pressure is monitored, displayed locally and transmitted to the PLC. In the event of high pressure an air vent release valve opens. A flow meter measures, displays and transmits the RO Unit flow to the PLC. During a normal operation ROC flows through the line at a preset flow rate that is set through a flow control valve. Valve controls are set locally. In Local valve position is set using the Open and Close selector switch; in Remote control is passed to the PLC that controls the RO System. Flow not directed to the UV system is split between the OPS and the RO CIP System. Conductivity and pressure are locally measured, displayed and transmitted to the PLC.

**RO Sequencing**

***Pre-Operative Feed Water RO Unit Bypass***

A pre-operative bypass shall be executed when the first unit is brought into service with all other units remaining offline. During this procedure cartridge filter effluent shall bypass all the RO units, allowing feed water parameters to stabilize at a set point and chemical flows to stabilize before feed water is admitted to the membranes.

***Post-Operative Feed Water RO Unit Flush***

An automatic post-operative feed water flush cycle which shall be initiated automatically upon shutdown of the plant, unless the Operator selected no feed flush option. The purpose of the post-operative feed water flush cycle is to ensure that concentrate is flushed from the membranes to prevent fouling of the membranes, corrosion and scale accumulation.

***Post-Operative Permeate Water RO Unit Flush***

The membrane flush system is used to remove salt and scale buildup at the RO membrane surface that normally occurs during the membrane permeation process upon normal shutdown of the RO train. By flushing the membranes with RO permeate, any concentrated salts are washed from the membranes, minimizing possible scaling during system shutdown time periods. The flushing system is automatically energized during the normal RO system shutdown cycle or can be manually started by the facility operator.

**RO Flushing System**

A portion of the ROP is directed to the RO Flush Tank for use in flushing the membranes. A flow

**Attachment E, Proposal Form 8**  
**Operations Description – Reverse Osmosis System**

control valve is located on the flushing feed to admit solution during the flushing cycle. Valve controls are set locally. In Local valve position is set using the Open and Close selector switch; in Remote control is passed to the PLC that controls the RO System.

The tank level is measured, displayed locally and transmitted to PLC. The tank has switches that are used to activate the High-High and Low-Low Levels.

The tanks supply the RO flush pumps which discharge the ROP through the cartridge filter. The filtered ROP is divided between the CIP Makeup Tank and each RO feed line. Pump controls are set locally. In the On position the pump runs continuously; in the Off position the pumps does not run. Pump duty selection (duty, standby, or out of service) and pump start and stop levels are set from the configuration screen. In the event the Duty pump fails the Standby pump runs. When a pump is selected as out of service the pump is taken out of the control loop. The Duty pump starts at a preset low tank level and stops when the high level setpoint is reached. Discharge pressure is shown locally on the pump discharge. Pressure is monitored on the cartridge filter supply and is displayed locally and transmitted to PLC.

**RO CIP Makeup Tank**

RO CIP solution is formulated in the RO CIP Makeup Tank. Citric acid, ROP from the RO Flush Tank and sodium hydroxide are combined. The ROP line includes a flow meter and flow control valve to measure the makeup water volume added to the tank. The tank includes a site gauge to determine CIP level, a low level switch and a high level switch. On low level an alarm is generated to notify the Operator. The high level switch signals that an overflow event is imminent. Increase flows to the tank overflows to the RO CIP Containment Area.

The CIP Pumps draw from the CIP Makeup Tank discharge flow through the membrane and return the flow to the CIP Makeup Tank.

**RO Neutralization Tank**

The Neutralization Tank contains a solution of citric acid and sodium hydroxide that is blended together using a mixer. Mixer controls are located at the MCC and include a control selectors switch (Local-Off-Remote [LOR]), and reset pushbutton. In the Local position the pump runs continuously when the local control switch is in Start and stops when the switch is in Stop. Placing the local control switch in LO locks out the mixer. The neutralization solution returns to the Neutralization Tank through the RO Cleaning line. The tank includes a site gauge to determine, a low level switch and a high level switch. On low level an alarm is generated to notify the Operator. The high level switch signals that an overflow event is imminent. Increase flows to the tank overflows to the RO CIP Containment Area. A pH analyzer and level sensor are located on the overflow line. Both are displayed locally and transmitted to PLC.

**Chemical Feed Systems**

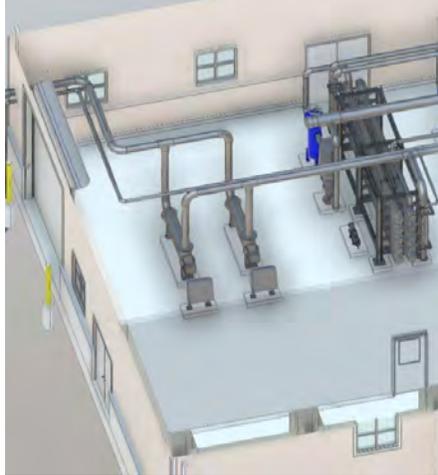

Refer to Att E-Proposal Form 10-Chemical Storage and Feed for details.

**Normal Operation**

Normally the system operates in Remote Auto.

## Attachment E, Proposal Form 9 System Description – UVAOP System

A UVAOP system is provided to disinfect RO permeate and destroy any carry-over pharmaceutical or endocrine disrupting compounds. The system will be housed in the RO Building.

### Key Overall Facility Features

- Located indoors in the RO building
- Power & Control Panel included with equipment
- UV lamps: Low-pressure high output (LPHO)
- Oxidant: Chlorine (delivered as 12.5% sodium hypochlorite solution)
- Cleaning System:
- UV AOP System including:
  - UV Reactors / lamps
  - Cleaning system (portable cart or automatic mechanical/chemical wiping system)
  - Power / Control Panels
  - Master Control Panel
  - Meters and Instrumentation
  - Safety Equipment
  - Special tools /spare parts
  - Oxidant storage and injection system.
- Treatment Requirements:
  - 1,4 Dioxane target log reduction 0.5 (DDW requirements for IPR)
- UV System Manufacturer/Supplier: Xylem, Trojan, Aquionics, or equal

### Equipment – UV Reactors

- Required UV Dose (TBD by UV system suppliers)
- 2 @ 0.31 – 0.93 MGD each, 1 duty, 1 standby.

### Equipment – Power & Control Panel

- Located adjacent to UV reactors in the UV reactor room
- NEMA Rating 4
- Temperature range 5 to 106 F
- Power Supply 480 V, 60 hz, 3-phase.

## Attachment E, Proposal Form 9 System Description – UVAOP System

### Equipment – Cleaning Equipment

- Due to the low pH and mineral content of the RO permeate cleaning of UV lamp sleeves is not required for AWT applications such as Morro Bay WRF. However, to conform to the RFP, two cleaning system options were evaluated. Option 1). Portable cleaning system consisting of cart, equipped with acidic commercial cleaning solution, 5 gallon bucket, sponges, gloves, tools to disconnect the quartz sleeve/lamp, lint free wipes, etc.. Option 2): Equip the UV reactors with automatic online mechanical/chemical cleaning system consisting of wiper rings, electric driven wiping mechanisms and brushes to periodically clean the quartz sleeves and the UV intensity sensor face on a set periodic interval. The two options have similar cost and therefore we will work with the City during the final design to select the preferred approach.

### Equipment – Oxidant and Storage Injection

- Required chlorine dose (2-4 mg/L)
- See Proposal Form 10 – Chemical Storage and Feed – Sodium Hypochlorite.

### Control Features

- The UV AOP system will be controlled by a vendor furnished Master Control Panel that is integrated into a Plant Control System.
- UV power
  - The UV power will be adjusted automatically via the reactor control panel based on changes in influent flow, temperature, pH, UVT, oxidant residual, and lamp age to achieve the desired target treatment requirements.

### Variations from PCR

- The UV AOP design exceeds the specified 1,4 Dioxane reduction of 0.5 log per the PCR. The system was sized to account for possible increased levels of 1,4 Dioxane and NDMA in the influent water and associated CA Notification levels. The maximum influent concentrations of 1,4 Dioxane and NDMA used for the basis of design are based on review of similar AWT's in CA. The design provides the following log reduction of target contaminants.
  - 1,4 Dioxane target log reduction >0.70 (based on anticipated maximum influent concentration of 5 µg/L, DDW requirements for IPR and CA notification levels ).
  - NDMA target log reduction >0.84 (based on anticipated maximum influent concentration of 69.8 ng/L, DDW requirements for IPR and CA notification levels).

*Future water quality characterization could be done during the initial design phase to confirm the basis of design. If the concentrations are lower it may be possible to decrease the cost of the AOP system.*

## Attachment E, Proposal Form 9 Operations Description – UVAOP System

### Purpose

The UVAOP receives water from the RO system, or directly from the MBR System. The UVAOP provides two mechanisms for treating organic contaminants – direct photolysis and oxidation with sodium hypochlorite. Hypochlorite is fed ahead of the UV units. Using the combined technology RO permeate is disinfected prior to indirect potable reuse.

### Description

The UV system receives permeate from the RO units and discharges disinfected water to the Product Water Storage Tank. The UV system is an enclosed system that functions to provide specific wavelengths of electromagnetic radiation to inactivate microorganisms by damaging their DNA and rendering them unable to replicate.

The two UV units each have a reactor vessel that contains its own individual enclosure to control the vessel which is connected to the Master Control Panel. The control panel sends and receives signals to and from the Plant Control System for remotely monitoring and operating the system. The system will be operated in a **Local Manual/Auto** mode through the UV Control Panel or, in a **Remote Manual/Auto** mode through SCADA. The UV power will be adjusted automatically based on changes in influent flow, temperature, pH, UVT, oxidant dose, and lamp age to achieve the desired target treatment requirements.

Each UV reactor is provided with a chemically free automatic wiping system which functions to avoid formation of organic and inorganic deposits on the UV lamps. The wiper assembly is actuated by a geared motor and operates automatically, provided the UV lamps are on and the system valves are open. Wiping intervals per hour are adjustable directly at the wiper control box, and range from one to seven wiping cycles per hour. A cycle consists of the wiper moving back and forth twice.

Sodium hypochlorite operation is described in Att E-Proposal Form 10-Chemical Storage and Feed .

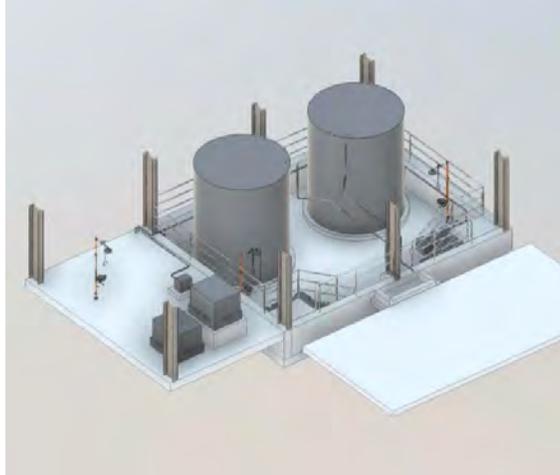

### Normal Operation

The UVAOP system operates in Remote Auto. The UV power will be adjusted automatically via the PLC based on changes in influent flow, temperature, pH, UVT, oxidant dose, and lamp age to achieve the desired target treatment requirements.

Wiping intervals per hour are adjustable directly at the wiper control box, and range from one to seven wiping cycles per hour. A cycle consists of the wiper moving back and forth twice.

THIS PAGE LEFT BLANK INTENTIONALLY

**Attachment E, Proposal Form 10**  
**System Description – Chemical Storage and Feed**

Treatment plants require the addition of various chemicals to ensure the proper treatment of the influent waste water. These chemicals are stored on site and dosed into the main process flows at the desired points. These chemicals are often hazardous and can cause damage to plant personnel or the environment if not handled properly. The facilities were designed with safety in mind to avoid potential harm.

**Key Overall Facility Features**

- Central Chemical Storage and Feed Facility will house sodium hypochlorite, sodium hydroxide, and sodium bisulfite. These chemicals are centralized as hypochlorite and hydroxide are stored in bulk, and bisulfite is dosed at a location where storage is impractical.
- The RO Building will be constructed with a lean-to structure for antiscalant and citric acid, and will also contain space for a future chemical (such as sulfuric acid) if deemed necessary in the future.
- The MBR facility will house its own small citric acid dosing system.
- The Aerobic Sludge Digestion facility will contain a polymer feeder / blender skid for dosing upstream of the sludge press equipment.
- Dosing pump skids will feature peristaltic pumps for metering and transferring chemicals.
- All facilities will feature secondary containment of bulk stored chemicals or secondary tubs for tote stored chemicals to ensure any chemical spills are kept from the environment.
- A shelf-spares of each pump type will be furnished in lieu of online spares as required by the RFP.
- Manufacturer: Prominent, Lutz-JESCO, Miltron Roy, or equal.

**Equipment – Storage Tanks**

- Sodium hypochlorite (12.5%) and sodium hydroxide (25%) will be stored onsite in FRP storage tanks.
- The tanks are approximately 10ft diameter by 10ft usable depth, or sufficient to contain a bulk truck delivery.
- These storage tanks will be located within a coated concrete secondary containment area to ensure any chemical spills are kept from the environment.

**Equipment – Storage IBCs**

- All other chemicals will be stored within 330 gallon Intermediate Bulk Containers, or IBCs.
- This size of tote will be sufficient for more than 15 days of average plant use.

**Attachment E, Proposal Form 10**  
**System Description – Chemical Storage and Feed**

- The totes will sit upon secondary containment tubs so that any spills will be contained and protected from the environment.

**Equipment – Pumping Skids**

- Chemical pumps will be skidded and prewired, to reduce complicated small bore piping and termination of wiring done in the field.
- The pumps will be peristaltic type, with on board controllers.

**Equipment – Polymer Feeder / Blender Skid**

- The chemical pump will be skidded and prewired, to reduce complicated small bore piping and termination of wiring done in the field.
- The blender will feature a mixing chamber to properly blend the emulsion polymer to aid in dewatering the sludge.
- The pump will be peristaltic type, with on board controllers.

**Truck Unloading Station**

- The chemical facility will be located adjacent to the road to allow chemical delivery trucks access for unloading.
- The location where trucks will park to offload chemicals will be depressed such that any large spills will be contained. The depressed area will drain into the secondary storage area so that it can be properly neutralized and disposed of without the risk of damage to the environment.

**Control Features**

- The truck unloading area will have audible alarms that alert the driver in the event of overfilling.
- All pumps will have the ability to be remotely controlled via the plant PLC, or locally for operator testing or manual feeding.

**Variations from PCR**

- **General:** Written approval from equipment and chemical vendors that the equipment meets their requirements has not been requested or provided at this stage. The systems will be designed with common safety and configuration standards for chemical facilities at wastewater plants.
- **Chemical Storage:** Safety splash shields have not been planned for between secondary containment areas. This is not typically done at water or wastewater treatment facilities and would add cost while reducing equipment accessibility. Additionally, these areas are typically noted as restricted access to avoid personnel being close to this equipment.
- **Feed Pumps:** The selected pumps will be sized to deliver the required flow plus the specified safety factor. The intent of the requirements listed in the RFP document will be met using manufacturer’s standard equipment to the extent possible in order to ensure the availability of spare parts and to reduce project costs associated with customized equipment.

**Attachment E, Proposal Form 10**  
**Operations Description – Chemical Storage and Feed**

**Purpose**

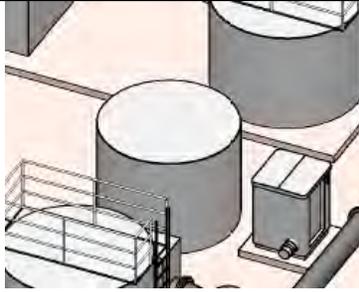

The chemical feed systems are operated to treatment chemicals at the required dose to various places in the process. Each chemical injection point has at least one pump dedicated to it for direct control of chemical dosage.

**Description**

All chemical systems will normally be operated in Remote-Auto. The systems will be designed to operate in dose control. Operators will periodically perform draw-down calibrations to input the correlation between pump speed and volume pumped into the Plant PLC system. For each injection point, operators will set a required chemical dose. The Plant PLC systems will vary the pump speed as required to deliver the required dose. The calibrated chemical metering pump is used to monitor the delivered chemical flow rate.

THIS PAGE LEFT BLANK INTENTIONALLY

## Attachment E, Proposal Form 11 System Description – Odor Control

An odor control system is furnished at the headworks for odor control.

### Key Overall Facility Features

- 1 packaged biofilter system with centrifugal fan for headworks odor control (See Proposal Form 1 and 2 for headworks equipment).
- Biofilter system vessel includes humidification chamber (Stage 1) followed by engineered media biofilter for odorant removal (Stage 2)
- Recirculation pump for Stage 1
- Irrigation system to distribute reclaimed water to Stage 2
- Nutrient tank and feed pump
- Standard instrumentation, control panel, and water panel

### Equipment – Biofilter System

- 1 FRP tower with corrosion resistant components.
- Media: Stage 1 = Synthetic, structured; Stage 2 = Engineered, inorganic.
- Empty Bed Residence Time: Stage 1 = 2 seconds; Stage 2 = 30 seconds.
- 99% H<sub>2</sub>S removal efficiency or 0.1 ppm discharge.
- Manufacturer: Integrity Municipal Systems, ECS, BioAir, or equal.

### Equipment - Fan

- 1 centrifugal fan with sound attenuating enclosure.
- 650 cfm airflow for headworks odor control.
- Manufacturer: Furnished by packaged biofilter manufacturer.

### Equipment – Nutrient Storage and Feed System

- 1 nutrient tank and feed system.
- Tank material and capacity: linear or cross-linked polyethylene resin, <100 gal. Furnished by biofilter manufacturer.
- Manufacturer: Furnished by packaged biofilter manufacturer.

### Control Features

- Local control and water panel by packaged biofilter manufacturer with Plant PLC start/stop and monitoring.
- Operators manually select which unit(s) operate and leave them running continuously.
- Local control panel initiates operation of fan, irrigation system, and nutrient feed system.

### Variations from PCR

- None noted.

**Attachment E, Proposal Form 11**  
**Operations Description – Odor Control**

**Purpose**

The Odor Control shall draw foul air from the Headworks and discharged the air to the biological Odor Scrubber.

**Description**

The odor control system uses microorganisms to metabolize odorous. An odor control fan draws odorous air from the head works through a fan pre-filter to capture particulates and discharges it to the once through scrubber. Treated air vents from the top of the scrubber to atmosphere.

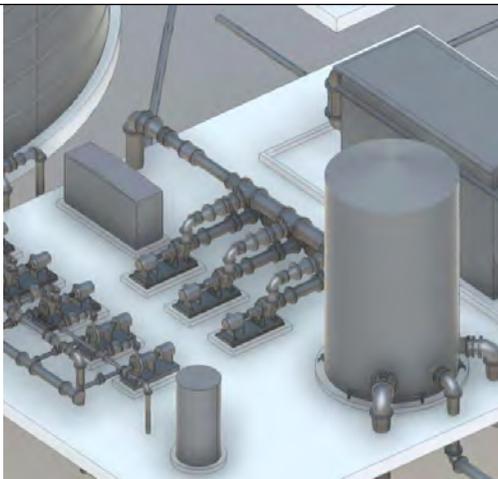

A differential pressure switch monitors the pressure drop across the prefilter. If the pressure drop is excessive the filter should be inspected for water accumulation or a dirty filter. Fan controls are set at the Local Control Station (LCS). Placing the control selector switch in Local pump operation is set using the Start or Stop switch; in Off the fan does not run; in Remote control is passed to the PLC and controlled through the SCADA screen. Fan status and control mode are passed from the LCP to the Odor Control Panel.

The filter media is highly porous with a special coating of nutrients and buffering agents to provide an optimal surface for biofilm growth without media degradation. The hydrogen sulfide reducing bacteria grow due to the nutrients and use the hydrogen sulfide as a food source. As long as nutrients are present, hydrogen sulfide is present in the incoming air flow, and enough water is being recirculated to help with sloughing of the bioslime, hydrogen sulfide reduction takes place. A differential pressure switch monitors the pressure drop across the media. If the pressure drop is excessive the filter should be inspected for excessive bioslime growth..

**Normal Operation**

The odor control system runs continuously in Remote Auto.

**Attachment E, Proposal Form 12**  
**System Description – (Effluent) Outfall Pump Station**

An Ocean Outfall Pump Station is provided to pump excess MBR Filtrate or SAFE Treated water to the ocean outfall. RO Reject also goes to the outfall, but residual pressure is used to drive it to the outfall without additional pumping.

**Key Overall Facility Features**

- Outfall Balancing Tank to receive flows from MBR system, SAFE System, or RO train effluent bypass. Balancing Tank allows three identical size pumps to be used over a wide flow range.
- Ocean Outfall pumps to deliver water to the Outfall Disinfection Contactor Pipeline and on to the Ocean Outfall.
- Outfall Disinfection Contactor Pipeline located on-site to provide required disinfection volume without requiring a tank to maintain. Dechlorination feed facility and point of compliance are located onsite for ease of operation.
- Pump type and materials selected for good efficiency and operating life.
- Flow meter for delivered flow monitoring.

**Equipment – Outfall Pumps**

- 3 @ 2,503 gpm @ 65 ft TDH each. 2 duty / 1 standby rated to deliver peak hour WRF influent flow rate less the feed flow to RO system.
- In event the RO system is offline during a peak hour flow event, the pumps are also designed to deliver 1,884 gpm @ 84 ft TDH each to deliver outfall flow equal to entire WRF influent flow rate with all three pumps in operation.
- All three pumps are the same size for ease of operation and equipment maintenance.
- All three pumps on VFD to allow direct control of pumping rate to maintain Outfall Balancing Tank level and required outfall flow. VFDs were also furnished on all three pumps to simplify operation instead of having to juggle operation of constant-speed pumps with variable-speed pumps.
- End-suction centrifugal pumps with epoxy lined casing, stainless steel impellers, and mechanical seals for corrosion resistance and long service-life.
- Manufacturer: Fairbanks Morse/Pentair, Grunfos, Xylem, or equal.

**Control Features**

- Operated directly by plant PLC system.
- Operators select lead, lag, and lag-lag pumps, or set a pump to be out of service.

**Attachment E, Proposal Form 12**  
**System Description – (Effluent) Outfall Pump Station**

- PLC starts or stops pumps and adjusts speed uniformly to maintain low level in Outfall Balancing Tank. In lower flow scenarios, the system will cycle a pump on and off at minimum speed and use the Balancing Tank to equalize the flow as needed to have less than 6 starts on each pump per hour.
- Pumps can be manually operated in the PLC to start/stop and set operating speed if needed.

**Variations from PCR**

- The size for the Ocean Outfall Line to the existing outfall was listed in the RFP as 16” with size to be coordinated during design. This design assumes a 20” C900 PVC pipe will be utilized from the plant site to the high-point at Quintana Rd. and Kings Ave. with 16” C900 thereafter to optimize pump design for an overall best value between the pipe and pump station. The high-point at Quintana Rd. and Kings Ave. being the hydraulic governing feature. An air/vacuum relief valve is recommended at the high-point to ensure a siphon does not develop down to the existing outfall which could create large negative pressures and collapse the pipeline.

**Attachment E, Proposal Form 12**  
**Operations Description – (Effluent) Outfall Pump Station**

**Purpose**

The Outfall Balancing Tank will receive flows from MBR system, SAFE system, or RO train effluent bypass. The ocean outfall pumps deliver water to the Outfall Disinfection Contactor Pipeline for where sodium hypochlorite is added for disinfection. Disinfection requirements are met without including the tank volume. The flow is dechlorinated with sodium bisulfite prior to ocean outfall.

**Description**

**Outfall Balancing Tank**

The Outfall Balancing Tank acts as a reservoir for flows from MBR system, SAFE system, or RO train effluent bypass. The tank level is measured continuously, displayed locally and transmitted to SCADA. In the event inflow to the tank is greater than outflow an overflow line directs flow to the ground.

**Outfall Pumps**

Three VFD driven centrifugal pumps operate periodically to transfer the contents of the Outfall Balancing Tank to the ocean outfall. With the pumps energized control is set locally using the control selector switch (Hand-Off-Remote). In the Hand position the pump runs continuously; in Off the pump does not run; in Remote control is transferred to SCADA. In Remote Auto the pump duty roles are selected lead, lag, and lag-lag pumps, or out of service) are set at SCADA. Selecting Out of Service removes the pump from the control scheme which inhibits associated alarms. At a preset high tank level the pumps start and run continuously. Pump speed is adjusted to maintain a preset flow rate from the outfall pumps. Pump operation stops at a preset low level. In lower flow scenarios, the system will cycle a pump on and off at minimum speed and use the Balancing Tank to equalize the flow as needed to have less than 6 starts on each pump per hour. A flow meter is located on the pump discharge manifold and is used to control the outfall pump speed as well as the sodium hypochlorite feed pumps.

**Chemical Fed Systems**

Refer to Att E-Proposal Form 10-Chemical Storage and Feed for details on the sodium hypochlorite and sodium bisulfite chemical systems.

**Normal Operation**

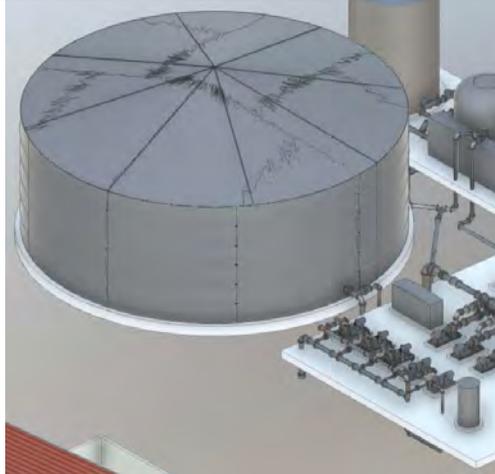

The Outfall Balancing Tank is in continuous operations. The pumps normally operate in Remote Auto as required to meet an adjustable outfall pump flow rate.

**Alternative Operation**

- The pumps normally operate in Remote Manual through SCADA.
- The pumps may be run locally from the VFDs.

THIS PAGE LEFT BLANK INTENTIONALLY

**Attachment E, Proposal Form 13**  
**System Description – IPR (Product Water) Tank and Pumps**

A large tank is provided to store finished IPR (Product) water on-site. IPR Pumps are furnished to pump this water to the Morro Wellfield. The IPR (Product) Water Tank is also used to furnish the Onsite Recycled Water Pumps (see form 14) and flushing water for the Calcite Remineralization System (see form 15) to clean new deliveries of media.

**Key Overall Facility Features**

- 500,000 gallon tank for on-site storage of IPR Product Water.
- IPR Pumps to pump IPR Product Water for indirect potable reuse via groundwater injection at the Morro Wellfield.
- Pump type and materials selected for good efficiency and operating life.
- Flow meter for delivered flow monitoring and control.
- Sodium Hypochlorite (chlorine) Injection to maintain residual for transmission and obtain virus reduction credits.

**Equipment – Product Water Storage Tank**

- 500,000 gallon glass-lined bolted steel tank.
- Bypass piping furnished for flexibility in maintenance or inspection operations.
- Vent with bug-screen.
- Access manway furnished.
- Manufacturer/Fabricator: California Aquastore-CST, Engineering America, or equal

**Equipment – IPR Pumps**

- 3 @ 323 gpm @ 63 ft TDH each. 2 duty / 1 standby. Rated to deliver up to full RO production capacity of 0.93 mgd. All three pumps are the same size for ease of operation and equipment maintenance.
- All three pumps are the same size for ease of operation and equipment maintenance.
- All three pumps on VFD to allow direct control of pumping flow or pressure.
- VFDs were also furnished on all three pumps to simplify operation instead of having to juggle operation of constant-speed pumps with variable-speed pumps.
- End-suction centrifugal pumps with epoxy lined casing, stainless steel impellers, and mechanical seals.
- Manufacturer: Fairbanks Morse/Pentair, Grunfos, Xylem, or equal

**Attachment E, Proposal Form 13**  
**System Description – IPR (Product Water) Tank and Pumps**

**Control Features**

- Operated directly by plant PLC system.
- Operators select lead, lag, and lag-lag pumps, or set a put to be out of service.
- PLC starts or stops pumps and adjusts speed uniformly to maintain either operator input flow setpoint or pressure setpoint.
- Pumps can be manually operated in the PLC to start/stop and set operating speed if needed.

**Variations from PCR**

- No variations noted.
- The size for the IPR line to Morro Wellfield was not indicated in the RFP. This design assumes a 10" C900 PVC pipe will be utilized with the high-point at Quintana Rd. and Kings Ave. being the hydraulic governing feature. An air/vacuum relief valve is recommended at the high-point to ensure a siphon does not develop down to the Morro Wellfield which could create large negative pressures and collapse the pipeline.

**Attachment E, Proposal Form 13**  
**Operations Description – IPR (Product Water) Tank and Pumps**

**Purpose**

The IPR Product Water Storage system provides operational storage and pumping of the disinfected product water. The storage tank supplies the recycled water pumps, on-site reclaimed water pumped. In the event the tank level reaches the overflow pipe product water is discharged to the ocean outfall wetwell. Chemicals are added before flow enters the tank to stabilize the water. Sodium hydroxide is added to lower the pH to reduce the corrosive nature as water is conveyed distribution areas. Sodium hypochlorite is added to maintain chlorine residual in the distribution system.

**Description**

The Product Water Storage Tank level is measured, displayed locally and transmitted to SCADA. The tank has switches that are used to activate the High-High and Low-Low Levels. Tank discharge water is monitored for chlorine residual, conductivity and pH. Values are transmitted to SCADA.

The tanks supply the product water pumps which transfer product water to the groundwater discharge. Pump controls are set locally. In the Hand position the pumps are operated locally using Start and Stop pushbuttons and the speed adjusted using a potentiometer; in the Off position the pumps do not run; in the Remote position control is passed to SCADA. Pump pressure is displayed locally. Pump duty selection (lead, lag, and lag-lag pumps, or set a pump to be out of service) is set from the configuration screen. In the event the lead pump fails the lag pump is promoted to the lead pump role; should the lag pump fail the lag-lag pump is promoted to the lag pump role. When a pump is selected as out of service the pump is taken out of the control loop. The pump start, stop and adjust speed to maintain the input flow setpoint or pressure setpoint. A pressure switch located on the pump discharge generates an alarm to SCADA and shuts down a pump.

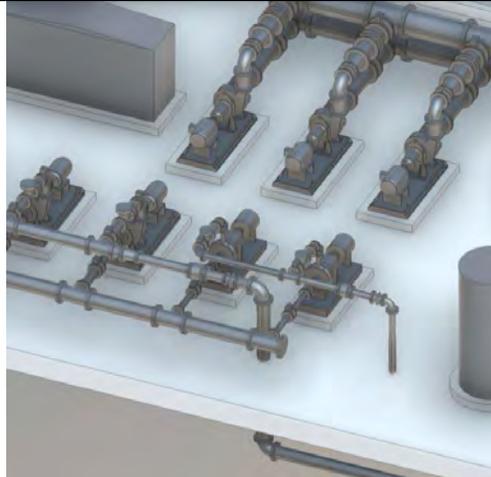

The product water pump discharges to a common manifold. Flow, discharge pressure and pH are measured, displayed locally and transmitted to SCADA.

**Normal Operation**

Normally the system operates in Remote Auto with all pumps in service and each pump selected for a duty role (lead, lag and lag-lag).

THIS PAGE LEFT BLANK INTENTIONALLY

**Attachment E, Proposal Form 14**  
**System Description – On-Site Recycled Water Pump Station**

An On-site Recycled Water Pump Station is furnished to deliver IPR (Product) water to a distribution system on the site to supply various water uses around the site such as irrigation, process spray water, and washdown.

**Key Overall Facility Features**

- Pumps to deliver IPR water from the Product Water Storage Tank into a plant-wide recycled water distribution system.
- 500 gallon air-bladder tank to supply low demands below minimum pump flow rates.
- Pump type and materials selected for good efficiency and operating life.
- Flow meter for delivered flow monitoring.

**Equipment – Outfall Pumps**

- 2 pumps rated for 75 gpm @ 175 ft TDH each. 1 duty/1 standby for normal plant demands. 2 duty for higher demand periods such as large washdown demands or irrigation with normal plant demands.
- Both pumps are the same size for ease of operation and equipment maintenance.
- Both pumps on VFD to allow direct control of distribution pressure. VFDs were also furnished on both pumps to simplify operation instead of having to juggle operation of one constant-speed pump and one variable-speed pump.
- End-suction centrifugal pumps with epoxy lined casing, stainless steel impellers, and mechanical seals for corrosion resistance and long service-life.
- Manufacturer: Fairbanks Morse/Pentair, Grundfos, Xylem or equal

**Equipment – Air Bladder Tank**

- One 500 gallon air-bladder tank to supply low demands between pump operation cycles.
- Manual charging of the air-bladder is done semi-annually with a portable compressor.
- Steel vessel with EPDM or similar bladder. All wetted steel components are epoxy lined.
- Manufacturer: Amtrol WellXTroll, or similar.

**Control Features**

- Operated directly by plant PLC system.
- Operators select lead and lag pumps, or set a pump to be out of service.
- PLC starts or stops pumps and adjusts speed uniformly to maintain set distribution pressure. If

**Attachment E, Proposal Form 14**  
**System Description – On-Site Recycled Water Pump Station**

distribution pressure continues to rise with one pump in operation at minimum speed, that pump will cycle off and allow the air-bladder tank to supply those low demands. The pump will automatically restart when distribution pressure dips indicating the air-bladder tank is not keeping up with demands.

**Variations from PCR**

- No variations noted.

**Attachment E, Proposal Form 14**  
**Operations Description – On-Site Recycled Water Pump Station**

**Purpose**

The Onsite Recycled Water Pump Station supplies water from the Product Water Tank to various non-potable water demands on the site such as irrigation, process sprays, and washdown.

**Description**

Pump controls are set locally. With the control selector switch in the Local position the pump are operated using Start and Stop pushbuttons and the speed adjusted using a potentiometer; in the Off position the pumps to not run; in the Remote position control is passed to SCADA. Pump pressure is displayed locally. Pump duty selection (lead, lag or set a put to be out of service) is set from the configuration screen. In the event the lead pump fails the lag pump is promoted to the lead pump role; the third pump is used as a standby pump. When a pump is selected as out of service the pump is taken out of the control loop. In Remote Auto the pump(s) start or stop and adjusts speed uniformly to maintain set distribution pressure. If distribution pressure continues to rise with one pump in operation at minimum speed, that pump will cycle off and allow the air-bladder tank to supply those low demands. The pump will automatically restart when distribution pressure dips indicating the air-bladder tank is not keeping up with demands. The pumps discharge to a common manifold where flow, discharge pressure and pH are measured, displayed locally and transmitted to SCADA.

**Normal Operation**

Normally the system operates in Remote Auto with two pumps selected for service and pump duty roles selected (lead | lag). The air bladder tank equalizes differences between the pump output and the system demand without operator intervention.

THIS PAGE LEFT BLANK INTENTIONALLY

**Attachment E, Proposal Form 15**  
**System Description – Calcite Remineralization System**

Reverse Osmosis permeate is aggressive and can react with piping systems and mechanical equipment. To protect equipment, minerals must be put back into the water to stabilize the effluent. The effluent will pass through a vessel containing calcite which will dissolve into the water which will add hardness, alkalinity and increase the pH to protect downstream equipment from corrosion.

**Key Overall Facility Features**

- Upflow pressure vessels containing calcite to stabilize the RO effluent.
- Flush pump provided to remove fines when media is periodically loaded.
- Flush Tank provided to receive the calcite vessel flush flow before disposal to not overwhelm the drain system.
- Manual isolation valves for operation.

**Equipment – Calcite Contactor Vessels**

- Two vessels provided, sized to allow for the entire flow to pass through a single vessel so that the other can be taken offline for service or media loading.
- Painted carbon steel construction with epoxy interior coating.
- Manufacturer: Wigen Water Technologies, Tonka Water, or equal.

**Equipment – Flush Pump**

- One flush pump provided due to infrequency of washing.
- End suction centrifugal pump to be supplied as part of Calcite Contactor System Package.
- Manufacturer: To be determined by Calcite Contactor System Manufacturer.

**Control Features**

- Manual device, with alarms provided to indicate high differential pressure.
- Backwash sequence is manually initiated and executed.

**Variations from PCR**

- None noted.

**Attachment E, Proposal Form 15**  
**Operations Description – Calcite Remineralization System**

**Purpose**

The remineralization system adds minerals that were taken out during the RO process back into the UV effluent to stabilize the water.

**Description**

**Calcite Vessels**

UV effluent shall pass through a vessel containing calcite which will dissolve into the water and add hardness, alkalinity and increase the pH to protect downstream equipment from corrosion. The system is designed to permit full plant flow through the online (duty) vessel. A second vessel is used in a standby role when the duty vessel requires while cleaning. UV effluent flowing through the online vessel dissolves some of the media to a neutral pH (about 7.0) and delivers stabilized water to the Product Water Tank (PWT). Manually operated valves are used to position one tank for duty and one for standby. Pressure is monitored locally on the vessel inlet and out. The differential pressure is measured across the media bed in each vessel. At a preset high differential pressure a switch is energized which generates an alarm to SCADA. The Operator then switches vessels to maintain UV effluent remineralization. The offline vessel is configured to discharge to the BHT and the Flush Pump is energized.

It takes around 20 minutes at 15 gpm/ft<sup>2</sup> to clear fines out of new calcite. The BHT has a small pipe that contains a motor operated valve that bleeds the contents out over 24 hours to the plant sewer and thus to the head of the plant. Regulating the rate in this manner insures that the plant is not upset.

**Flush Pump**

The Flush Pump is controlled locally from the local control panel (LCP). With the control selector switch in the Local position the pump is controlled using the Start/Stop handswitch. In the Start position the pump runs continuously; in the Off position the pump does not run. In the Stop position the pump does not run. With the control selector switch in the Off position the pump does not run; in the Remote position pump control is transferred to the PLC and operation set through SCADA. Pump speed can be adjusted locally or through SCADA. Pump discharge pressure is displayed locally. The pump will shut down on high temperature or motor overload. Pump status, operating mode and alarms are transmitted to SCADA thru the PLC.

**Backwash Holding Tank (BHT)**

BHT level is measured and displayed locally and the level transmitted to SCADA. In the event of a high tank level an overflow directs the water to the ground. A motorized tank drain is used to drain the tank contents to the sewer or storm drain. Controls are mounted on the valve actuator. With the control selector switch in the Local the valve is set using the position handswitch. In the Open position the valves opens; in the Off position the valve does not move; in the Closed position the valve shuts. Valve status, operating mode and alarms are transmitted to SCADA thru the PLC. In the Remote position control is transferred to SCADA where the valve can be opened or closed. A flow meter is located on the drain line and measures, displays locally and transmits the flowrate to SCADA.

**Normal Operation**

One vessel is normally on line and the Flush Pump is Off. Vessel discharge is directed to the PWT.

**Abnormal Operation.**

**Attachment E, Proposal Form 15**  
**Operations Description – Calcite Remineralization System**

On high differential pressure the offline vessel shall be placed online and the originally online vessel shall be have the inlet and PWT outlet line shut. The BHT outlet line shall be opened and the Flush Pump run for a period of 20 minutes

THIS PAGE LEFT BLANK INTENTIONALLY

## Attachment E, Proposal Form 16 System Description – Civil Site

### Key Overall Facility Features

- Earthwork required to develop a graded platform for the new Water Reclamation Facility
- Access roads within the WRF plant site
- Stormwater management within the WRF plant site
- Yard piping (both process and utility) within the WRF plant site
- Chemical distribution ductbank
- Site electrical facilities including power distribution and site lighting (reference Electrical Proposal Form for information)

### Equipment – Sanitary Lift Station

- 1 lift station with duplex submersible pump configuration
- Pumps appropriate for raw wastewater application
- Assumed flowrate of up to 300 gpm; assumed rated head 60-ft
- Controls based on float switch located within manhole with alarm signal sent to plant SCADA/PLC system.
- Manufacturer: DXP, Xylem, Flygt, or similar.

### Variations from PCR

- Section 5.7, Items 4 and 8: Based on information provided by the City in Addendum No. 2 related to available flow and pressure at the tie-in point for firewater supply, it has been determined that sufficient flow and pressure should be available to meet the requirements of NFPA without including a firewater pump system or a firewater tank. Therefore, these components have been omitted from the proposal. Any changes in availability of flow or pressure could require re-introduction of these facilities and will require price adjustment.
- Section 5.8, Item 3 indicates slopes of unpaved areas should not exceed 3H:1V. However, the geotechnical report (provided as Appendix J of the RFP and as prepared by Yeh and Associated, dated November 28, 2017) indicates that cut slopes and fill slopes can be constructed at up to 2H:1V (reference section 7.1.7). Exception to the maximum slopes indicated in the RFP was taken and the geotechnical recommendations were used for the development of the graded platform provided in this proposal. This exception only applies to the cut and fill slopes at the perimeter of the WRF site platform and all slopes of unpaved area within the plant site itself are well below the 3H:1V slope.

**Attachment E, Proposal Form 16**  
**Operations Description – Civil Site**

**Purpose**

Provide a functional layout that allows good access for operations and maintenance activities.

**Description**

Facilities are accessible along a corridor that runs the length of the plant. Sufficient space has been allocated such that a crane can be deployed to assist with maintenance activities. The selected site has good drainage that moves water away from the plant during rain events.

**Normal Operation**

Does Not Apply.

**Attachment E, Proposal Form 17**  
**System Description – Electrical**

**Key Overall Facility Features**

- Onsite primary infrastructure to a utility pad-mounted transformer and for the transformer secondary lateral to the service switchboard per PG&E’s requirements.
- Provide space for future PV equipment adjacent to the main service switchboard.
- A radial distribution network for both of the normal and emergency 480Y/277V, three-phase, four wire systems and the 208Y/120V, three-phase, four-wire systems within the site.
- A main electrical building housing the main service switchboard and transfer switch, 2 motor control centers for the headwork, dewatering area and chemical storage, and a transformer for serving the panel that will provide the 120V branch-circuits at and near the equipment.
- 1 motor control center located in RO electrical room to serve the RO, UV, Product Water, and Administrative Building.
- 1 Diesel Emergency Generator to backup the entire site.
- Site electrical facilities including power distribution and site lighting (reference Electrical Proposal Form for information)

**Equipment – Utility Electrical Service**

- Furnish and install 1 direct-buried PVC underground ductbank for the primary service PG&E cable as per the PG&E’s requirement.
- Furnish and install the an utility transformer concrete pad as per the PG&E’s requirements.
- Install the PG&E furnished utility transformer with secondary service rated at 480VAC.
- Furnish and install direct-buried PVC underground ductbanks from the utility transformer to a main service board in the Electrical Building per the PG&E’s requirement.
- Furnish and install a main service board rated at 480VAC, 2000 Amp, with a utility metering package and utility cable entry compartment in the Electrical Building.

**Equipment – Electrical Building**

- A 40’ X 12’ X 10’ (LXWXH) pre-engineering FRP building with HVAC unit and lightings.
- The Electrical Building houses the utility main service board, an automatic transfer switch, future space for the PV equipment, 2 motor control centers, 480/280/120 dry type transformer, the main plant PLC panel, power and lighting panels.

**Equipment – Main Service Switchboard**

- A 480Y/277V, three-phase, four-wire, 2000A, indoor rated switchboard including pull section, distribution section, and automatic transfer section bussed together for a complete unit
- 4 X distribution breakers for 3 motor control centers and 1 future PV connection.
- Metering package for the utility power
- Surge protection device

**Equipment – Site Electrical Distribution Infrastructure**

- The underground direct-buried PVC ductbanks for the PG&E’s cables will be per the PG&E’s requirements. Manholes and handholes will be provided per the PG&E’s requirements.
- All site underground duckbanks will be concrete encased Schedule 40 PVC conduits with buried depth per the City’s requirements and electrical code requirements.
- Aluminum cable trays for different voltage classes as primary distribution raceway in non-hazardous area.

**Attachment E, Proposal Form 17**  
**System Description – Electrical**

**Equipment – Motor Control Centers & VFDs**

- 2 indoor rated MCC's in Electrical Building and 1 indoor rated MCC in RO Electrical Building.
- All MCC's are per IEEE and NEMA standards
- All MCC's have fully rated tin plated copper bus bar, hardwired magnetic combination starters with protection and feeder breakers.
- 18 pulse VFD's for equipment rated 100 hp or larger.

**Variations from PCR**

- See text above for description of proposed electrical design criteria, some of these criteria may differ from select criteria listed in the RFP. Any deviations were made to furnish the best overall value to the City while being consistent with customary wastewater facility design standards and meeting all applicable codes.

**Attachment E, Proposal Form 17**  
**Operations Description – Electrical**

**Purpose**

The electrical generator provides backup power to the facility in the event of an electrical power disruption from the primary source.

**Description**

The diesel driven engine-generator system includes the following components:

- Engine-generator unit
- Exhaust silencer
- Engine starting batteries with charger
- Day tank
- Underground fuel storage tank
- Switchgear

**Normal Operation**

The emergency generator should be operated weekly to verify expected operation.

The unit automatically starts and connects to the plant's electrical loads when initiated from the automatic transfer scheme. Power is transferred to the emergency generator during a power loss from PG&E. Once PG&E power is restored the engine generator is taken off line.

The emergency engine-generator is normally operated in the Standby mode. Upon loss of utility power, a protective relay sends a signal to the MCP calling for the engine-generator to start. The MCP automatically starts the engine-generator, and ramps it up to rated voltage and speed. The MCP sends an Open signal to the utility breaker on the switchgear. After receiving verification the utility breaker is opened and an open transfer time delay has expired, the MCP closes the generator breaker at the switchgear, allowing the engine-generator to connect to the switchgear load bus. Upon return an adequate air supply to the utility power, the protective relay removes its signal from the MCP; the MCP transfers the load back to the utility source in either an open or closed transition fashion. The engine-generator is disconnected from the load bus, and continues to run until the predetermined and adjustable cool-down relay has expired.

THIS PAGE LEFT BLANK INTENTIONALLY

## Attachment E, Proposal Form 18 System Description – I&C

### **Key Overall Facility Features**

- A self-healing fiber optic ring configuration for the plant control network.
- Ethernet based communications between the Plant PLCs and the SCADA I/O servers.
- Ethernet based communications between Plant PLC's and vendor PLC's.
- Distributed Remote I/O panels in RO area, Chemical area, MBR area, Solids area, and Headwork area to minimize hardwired cabling.
- Dual firewall DMZ (demilitarized zone) design to separate the Plant Control Network and the Office Network.
- Redundant Historian Servers and I/O Servers to increase the reliability of the SCADA network.
- CMMS Package for maintenance purpose.
- Wireless network within the site facilities for the ease of access of the plant control network.
- Multiple SCADA HMI licenses for on-site and off-site accesses.
- UPS for main Plant PLC, SCADA servers and operation computers.

### **Equipment – PLC, SCADA**

- The main Plant PLC's make and model will be in accordance to the SCADA Master Plan requirement.
- Redundant processors, communication modules and power supply modules for the main Plant OLC.
- The main Plant PLC located indoor in the Electrical Building.
- Redundant I/O servers and Historian servers will be provided.
- 1 X Operator PC with full SCADA HMI run-time license, 1 X Engineering Workstation with full SCADA development license will be provided.
- 3 additional SCADA HMI run-time licenses will be installed on the City's remote computer and tablet PC's.

### **Variations from PCR**

- Section 9.2.1, Field Bus Device Network. Per section 9.4.1, it requires the analog I/O modules to be 4-20mA. In order to provide consistent I/O design, all I/O's for the project will be hardwired signals instead of field bus devices.
- Section 9.4.1 requests the vendor PLC's to be same as the rest of the Plant PLC. Since the SCADA Master Plan is not available to determine what PLC platform is required, standard equipment vendor PLC is included in the proposal instead.
- Section 9.5.1 requests the duplicate functionality of vendor HMI screens on the SCADA HMI with all parameters can be monitored and controlled. As the SCADA Master Plan is not available to determine the PLC platform so standard equipment vendor PLC package is included in the proposal. Not all the control functions can be duplicated on the SCADA HMI screens for the standard equipment vendor PLC package. Instead, high level commands for the equipment packages will be provided at the SCADA HMI level but no component level commands will be provided.
- Section 9.5.1 requests the vendor screens to conform with the City's SCADA Standard. Since the SCADA Master Plan is not available, standard equipment vendor PLC packages with the vendor standard screens are provided instead.
- Section 9.2.1 requests access nodes in the site. Instead of providing access nodes, 2 HMI full run-time licenses will be installed on the City's tablet computers so the operator will be able to access the Plant SCADA on site through the wireless network.

## Attachment E, Proposal Form 18 Operations Description – I&C

### Purpose

For Operations the instrumentation and controls (I&C) rolls up to the Supervisor Control and Data Acquisition (SCADA) system. SCADA allows an Operator in a location central to make set point changes on distant process controllers, to open or close valves or switches, to monitor alarms, and to gather measurement information. The SCADA systems provides streamlined control of plant processes from a single user interface.

### Description

The SCADA system is a control system architecture that uses networked computers to control, alarm and store data. Peripheral devices such as programmable logic controllers and discrete PID controllers interface to the process equipment.

### Normal Operation

The Operator uses SCADA for the following:

- Monitor equipment status,
- Operate selected equipment remotely
- Alarm notification,
- Review and adjust operational setpoints,
- Identify equipment that is **in** service and out of service (not in the control loop),
- The SCADA Historian is used to accumulate data required for reporting.

**Attachment E, Proposal Form 19**  
**System and Operational Description – Architectural**

**Key Overall Facility Features**

- Buildings for the Operations Facility, Maintenance Facility, and RO/UV (Advanced Treatment) Building
- Various canopies for parking areas, outdoor process equipment, and general storage
- Landscaping and Screening in strategic locations around the WRF site to enhance the visual presentation of the site to the public and adjacent property owners

**Purpose**

To provide an overall aesthetic scheme for the WRF including conceptual building and canopy exteriors, landscaping plans which present the WRF as an agricultural facility consistent with current property use. Also, provide durable, low maintenance facilities in conformance to controlling structural criteria and considering the intended use of each facility within the WRF process scheme.

**Description**

- The Operations Building will be the focal point of the WRF aesthetic presentation to the community as this building will be located at the “front” of the plant relative to the site entrance and the nearby scenic Highway 1. The facility will present a horse barn style incorporating a clerestory and rooflines consistent with barn structures. Most other buildings on site will either be partially or completely hidden from the highway viewpoint by the Operations Building. The building is planned as a metal building with non-ferrous and coated metal wall panels, 4-ft tall burnished CMU wainscoting and non-ferrous, metal roof panels.
- The Maintenance Building and RO/UV Building are planned adjacent to one another in the middle part of the plant. These buildings are planned with similar finishes to the Operations Building but without the clerestory.
- Various covered parking canopies and canopies covering outdoor process equipment in the MBR and Dewatering Areas are also planned. Roofing materials for the canopies are planned to generally match those of the buildings.
- Landscaping will generally be a mix of larger, stand-alone trees such as California sycamores and live oaks. Where screenings areas are needed adjacent to the visitors parking area, next to the MBR facility, and in the area across the 2-lane plant road near the Maintenance Building,

**Attachment E, Proposal Form 19**  
**System and Operational Description – Architectural**

decorative grasses and small bushes are planned. Finally, stormwater basins are planned as grass-lined with some internal planting such as tall grasses. These basins are planned with overflow outlets to help promote infiltration into the soil and improve water quality of runoff.

**Variations from the PCR**

- None noted.

**Attachment E, Proposal Form 20**  
**System and Operational Description – Structural**

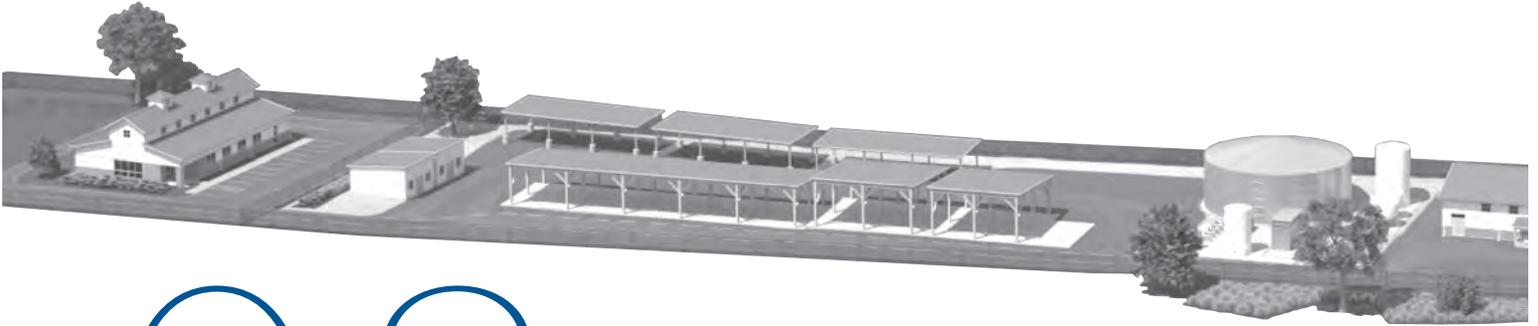

**Key Overall Facility Features**

- Foundations for various Process and General (Administration, Operation, and Maintenance) Facilities
- Buildings for the Operations Facility, Maintenance Facility, and RO/UV Building
- Various canopies for parking areas, outdoor process equipment, and general storage
- Miscellaneous concrete yard structures (e.g. manholes, vaults, etc.)
- Tanks including the large volume Recycled Water Tank

**Variations from the PCR**

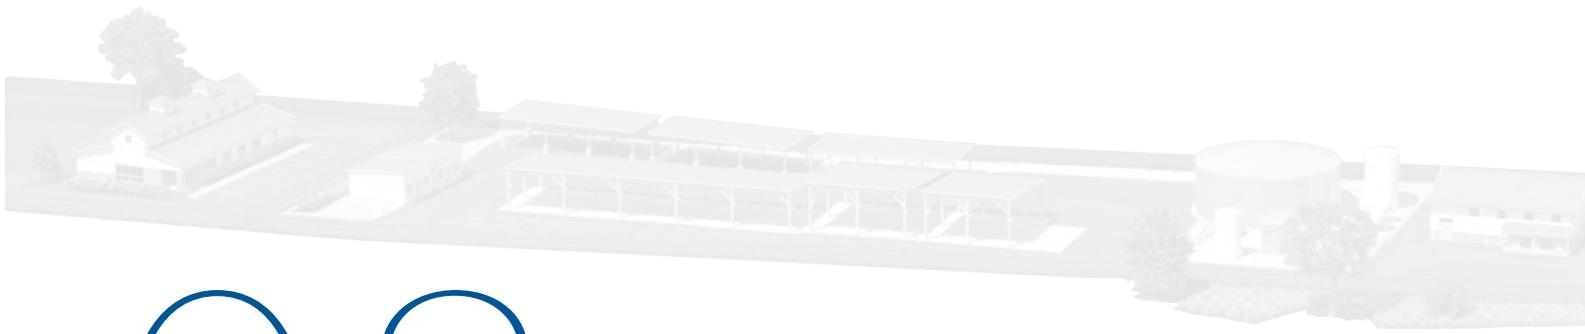

- Section 4.3, Item 3: The RFP states that the advanced treatment building (RO/UV Building) should be design for gravity and lateral loads from a second-storage addition of the same floor area. It was noted that no addition information on the building expansion requirement (clear height of second story, explanation of planned future use to predict required loading, etc.). Therefore, Filanc-B&V inquired on this requirement during proprietary meetings held between B&V management and City of Morro Bay representatives. Based on those conversations, Filanc-B&V has omitted any allowances for future second-story expansion of the RO/UV building.
- Section 4.5, Item 2: In general retaining walls were not implemented to develop the overall site graded platform. However, in order to maintain work-able cross slopes for the graded site platform in the areas of the Operations Building and the General Facilities (especially the covered equipment parking areas), short (5-ft tall or less) retaining walls are planned to develop finished grading levels. The plan for finished grading will be further developed during detailed design and are not included in the drawing set provided as part of the Filanc-B&V proposal drawing set. However, pricing for these shorter retaining walls are based on the use of concrete retaining block (CBR) walls in lieu of cast-in-place gravity retaining walls.

## PERFORMANCE GUARANTEE

# 08

## PERFORMANCE GUARANTEES

One of the best attributes of the DB delivery method is the feature that allows Owners to verify the performance of the facility. No other delivery method features this element because the risk is spread amongst multiple contractual entities. Design-build keeps the performance of the facility with the singular contractual entity.

Morro Bay has requested performance guarantees for the effluent water quality, power, consumables, and equipment availability. FBV is offering guarantees on the following:

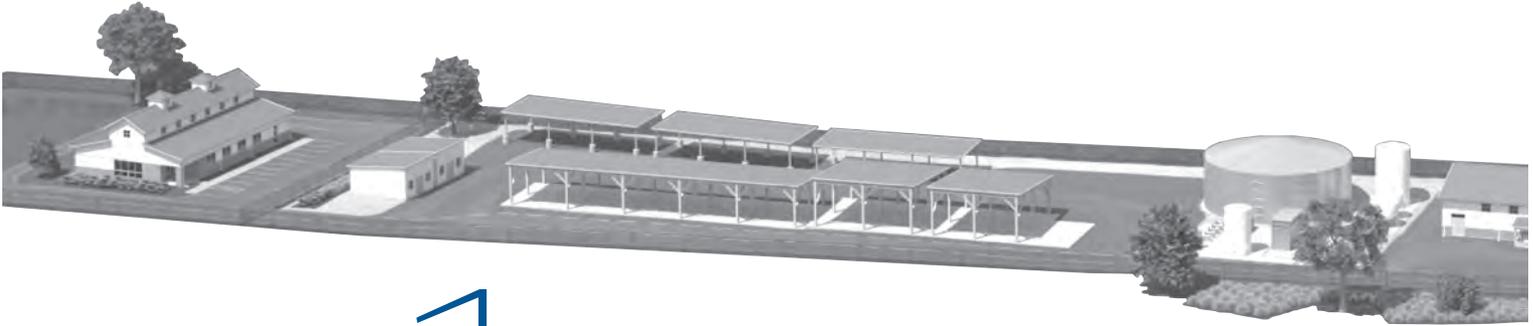

- Effluent water quality for the ocean outfall
- Effluent water quality for recycle water for groundwater injection
- Performance of the dewatering facility
- Power performance
- Chemical use

The details of our guarantees are in Appendix 4. Our guarantees also include our proposed liquidated damages should the facility fail to meet the guarantees.

The verification of the guarantees will be conducted during the Performance and Operation Testing Period as stipulated in Section 12.6 of the Performance Criteria Report. This time period is six months.

FBV will work side-by-side with the City Staff to ensure the verification period is a success for the City. FBV will provide an operator who is familiar with operating these types of facilities and will provide the necessary support to City Staff during the verification period.

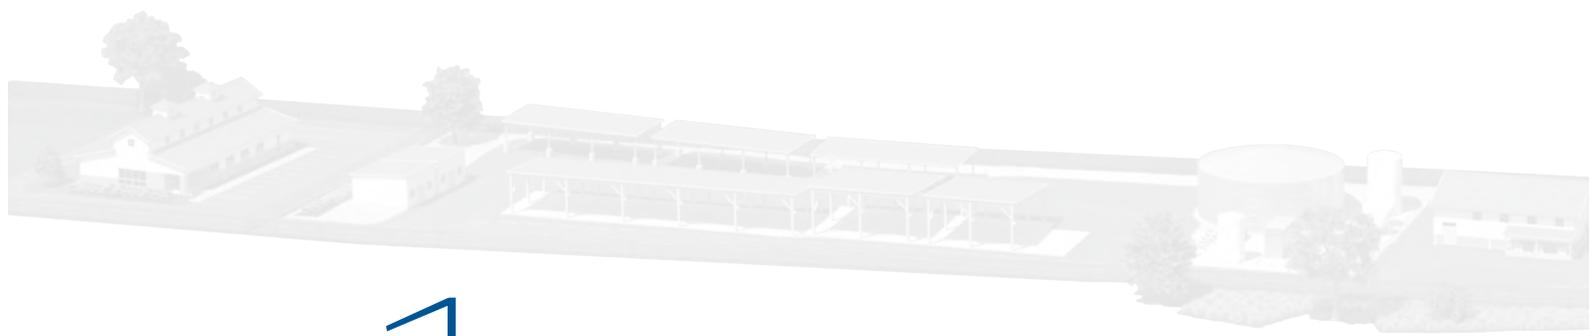

FBV looks forward to working with the City of Morro Bay on the specifics of the guarantees and making sure they meet the City's needs.

# PROPOSED DESIGN-BUILD CONTRACT CHANGES

---

Introduction to  
Comments to the  
Attachment B Proposed  
DB Agreement

Attached are the FBV comments to the Attachment B Proposed DB Agreement. We look forward to sitting down to discuss our comments. We have provided brief comments with brief explanations to assist with informing the reason for the comments. We know we can successfully arrive at a contract that suits both the City of Morro Bay's needs while also balancing risk between the two parties. We believe that an in-person negotiation meeting will go much further to better understand the parties positions and fully discuss the issues and arrive at a solution that meets all party's needs. Our price proposal reflects the contract and the comments we have attached. Not many of the legal comments will change what we have proposed. We do not foresee any of our comments keeping FBV from entering into a contract with the City of Morro Bay.

Comments to Morro Bay Proposed Attachment B Proposed DB Agreement

| No. | Agreement Section                  | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Explanation                                                                                                                                                                                                                                                                                                                                                   | Possible Impact on Commercial Term in the Contract Docs or Perf Criteria Report                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | NEW                                | Incorporate new section as follows: " <u>Limitation of Liability</u> . Notwithstanding anything to the contrary contained elsewhere in the Contract Documents or this Agreement, and to the fullest extent permitted by law, the total cumulative liability of Design/Build Entity and any of Design/Build Entity's related companies to City for all claims, losses, damages, and expenses resulting in any way from the performance or non-performance of this Agreement, whether arising under breach of contract or warranty, indemnity, tort (including negligence), strict liability, or other basis of legal liability, shall not be greater than the amount of compensation actually received by Design/Build Entity under this Agreement." | The request for a limit of liability is not intended to protect FBV from our company or subcontractors from acts of intentional misconduct or fraud, but rather to limit the liability of assigned responsibility for acts on the site that are out of our control or influence. We request that our liability be limited to the total value of the contract. | By reducing our total risk exposure by establishing a limit of liability, we are able to provide a more cost-effective proposal. We respectfully request this be added.                                                                                                                                                                                                                                                                                                                     |
| 2   | NEW                                | Incorporate new section as follows: " <u>Consequential Damages</u> . Notwithstanding anything in this Agreement or the Contract Documents to the contrary, Design/Build Entity shall not be liable to City for any losses of use, profits, business, reputation or financing or for consequential losses or damages, whether arising in contract, warranty, tort (including negligence), strict liability or otherwise."                                                                                                                                                                                                                                                                                                                            | To provide for a waiver of consequential damages for attenuated damages.                                                                                                                                                                                                                                                                                      | In order to provide a more cost-effective proposal, we respectfully request this be added.                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3   | Recital J                          | Delete second paragraph.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | The Design-Builder must be able to rely upon the documents which formed its proposal and which its price and risk were based upon.                                                                                                                                                                                                                            | The Design/Build Entity cannot be bound by terms and components except as they appear in its Proposal.                                                                                                                                                                                                                                                                                                                                                                                      |
| 4   | Article 1.1, Defenition Act of God | Revise to read: "Act of God: An Act of God shall include without limitation wars, floods, unusual delay in transportation, epidemics, earthquakes, adverse weather conditions not reasonably anticipated, fires, wild fires, forest fires, mudslides, tidal waves, , tropical storm, and any other acts, omissions, conditions, events, or circumstances beyond Design-Builder's control and due to no fault of its own or those for whom Design-Builder is."                                                                                                                                                                                                                                                                                       | Design Builder has no way to price for acts of God.                                                                                                                                                                                                                                                                                                           | The contract currently references a definition of "acts of God" that is very narrow and only includes tsunamis and earthquakes greater than a certain magnitude. Other acts of God are out of our control such as wildfires, flooding, etc. We respectfully request this be revised as shown. This way, the City will only pay if such events do occur and impact the Project or the Work. Otherwise, the Design/Build Entity will need to add contingency for events that may never occur. |
| 5   | Defenitions Article 1              | We suggest that there be defenitions added for the 6 month performance testing/verification period and also for the demolition work and associated times (if that is added to the Scope)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6   | Defenitions Section 1.18A          | At the end of the clause, add a new sentence: "For the avoidance of doubt, and notwithstanding the foregoing, the costs listed in SCHEDULE A-1 COST, are not included as part of Overhead or Fee.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | For clarity, the costs shown in SCHEDULE A-1 COST, are not included in overhead and our pricing does not include them in that. We are categorizing those costs as direct costs.                                                                                                                                                                               | We are not proposing a change in the wording, but offer the interpretation we applied to develop our Cost Proposal                                                                                                                                                                                                                                                                                                                                                                          |
| 7   | Defenitions Section 1.22           | After "Contract Documents", add ", but excluding the 6-month Performance Testing Period/Verification Period and the demolition of the existing WWTP".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | It needs to be clear that Final Completion of the Project occurs prior to the start of the 6 month verification period and that it will also occur prior to completion of the demolition scope should that be awarded.                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 8   | 1.11                               | Include "Proposed Change Order" as a valid term for the same concept as the defined "Change Proposal".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | "Proposed Changed Order" is the term used by Procure.                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 9   | 1.14                               | Change the term "Architect of Record" to "Engineer of Record".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | This is primarily an engineering design project.                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 10  | 1.26                               | Replace "... does not achieve the Certificates of Final Completion for the Project as required in..." with "... does not achieve the dates required in ..."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | This will avoid conflict with Section 7.7, which specifies LDs for more than just Final Completion.                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 11  | 2.4.2                 | Last sentence, change "the documents that provide the higher quality" to "the documents included in the Design/Build Entity's Technical Proposal".                                                | The Design-Builder must be able to rely upon the documents which formed its proposal and which its price and risk were based upon.                                                  | The Design/Build Entity has provided documentation in the proposal to show the basis of our design and price. Some of our approaches deviate                                                               |
| 12  | 3.10.2                | First Paragraph, final sentence, delete "significant" and change "may" to "shall".                                                                                                                | The Design/Build Entity should be able to recover costs in the event there are differing site conditions. Design/Build Entity should be entitled to relief if such conditions cause | We respectfully request this change be made so that risk can be better balanced.                                                                                                                           |
| 13  | 3.10.3                | Delete                                                                                                                                                                                            | This is inconsistent with 3.11, first paragraph, and also with 3.10.2.                                                                                                              | Inconsisten provision. Please harmonize with other sections to alleviate confusion                                                                                                                         |
| 14  | 3.18.1; 1st paragraph | Change "... Final Completion." to "... Substantial Completion." at the end of the first sentence.                                                                                                 | Warranties should commence to run upon Substantial Completion, when the project is ready to be used.                                                                                | Vendors warranties begin when substantial completion is achieved.                                                                                                                                          |
| 15  | 3.18.1, 2nd paragraph | Add "at Design/Build Entity's option" after "repair or replace".                                                                                                                                  | To clarify that this is Design Builder's responsibility.                                                                                                                            | We respectfully request that this be revised to show that this is the responsibility of the Design-Builder so that it is clear the contractual obligation is between the Design-Builder and its suppliers. |
| 16  | 7.5.1 (b) .2          | Change "execution of this Agreement" to "submission of the Proposal".                                                                                                                             | Design Builder has set prices and times based on the date it submits its priced proposal. Changes after that time may affect Design/Build Entity's costs and times for              | Because we are committing to a price for the project beginning with the date of proposal submission in May and contract execution will not be for                                                          |
| 17  | 7.7                   | 1st and 2nd paragraphs, change Liquidated Damages associated with Final Completion to \$1,000 per day.                                                                                            | Limits the exposure to the Design/Build Entity if delays beyond its control prevents issuance of Certificate of Final Completion                                                    | It reduces costs of the contract                                                                                                                                                                           |
| 18  | 7.7                   | 3rd Paragraph, delete the 3rd and 4th sentences, which begin "This paragraph shall not ..." Replace with: "The liquidated damages provided herein shall be in lieu of all liability for any       | LDs should be the remedy for damages arising from any delay in the times of performance so that the Design/Build Entity can adequately assess and price for the                     | We respectfully request this be revised to allow for us to manage defined risk in a balanced manner between all the parties.                                                                               |
| 19  | 7.7.2                 | Request modified language                                                                                                                                                                         | Design/Build Entity seeks language that affords due process before City takes "unilateral" action.                                                                                  | No cost impacts to proposed price                                                                                                                                                                          |
| 20  | 8.1.1                 | In last sentence, delete the word "materially".                                                                                                                                                   | Changes in cost or time should entitle Design/Build Entity to a Change Order.                                                                                                       | Materially is not defined and it is important to define when we are entitled to change orders. The City and the Design-Build entity can manage this risk                                                   |
| 21  | 8.2.1                 | Delete subparts 2 and 3                                                                                                                                                                           | The value of a Change Order should not be unilaterally determined.                                                                                                                  | No cost impacts to proposed price                                                                                                                                                                          |
| 22  | 10.1.2                | Delete the sentence "The City's written decision shall be final and binding on the party(ies)."                                                                                                   | The sentence in question appears to negate the option to proceed to the procedures identified in Public Contract Code Section 20104, also referenced in this Section.               | No cost impacts to proposed price                                                                                                                                                                          |
| 23  | 11.1.6                | Add "prior to Final Completion of the Work" at the end of the first sentence.                                                                                                                     | To be consistent with 11.1.9                                                                                                                                                        | No cost impacts to proposed price                                                                                                                                                                          |
| 24  | 11.1.9                | Add "except to the extent covered by the insurance required to be maintained under this Agreement" after "own cost". Also, add at the end of the sentence "prior to Final Completion of the Work" | To define that insurance coverages will be looked to first prior to Design/Build Entity having to self-fund.                                                                        | The Parties are paying to have insurance which may cover this risk and including that premium cost in the pricing. If it will not be used, this would add additional cost.                                 |
| 25  | 12.1.1 b ii 10)       | Delete "10) Errors & Omissions".                                                                                                                                                                  | This is covered by the Professional Liability currently shown as item 17                                                                                                            | This is duplicative and would not be a coverage under the CGL. Comments from our insurance carrier/broker.                                                                                                 |

| No. | Agreement Section  | Comment                                                                                                                                                                                                                                                                     | Explanation                                                                                                                                                                                            | Possible Impact on Commercial Term in the Contract Docs or Perf Criteria Report                                                                                                                           |

| 26  | 12.1.1 b ii b. ii. | Renumber this to be 12.1.1 c and then renumber the remaining numerals below it                                                                                                                                                                                              | Professional Liability coverage is a separate coverage and not a feature of CGL insurance. It should not be shown as one of the components of the CGL under b ii, but as its own category of coverage. | Comments from our insurance carrier/broker.                                                                                                                                                               |
| 27  | 12.1.1 b. ii. 18)  | Renumber this to be 12.1.1 d and then renumber the remaining numerals below it                                                                                                                                                                                              | Builder's Risk would be a separate coverage and not part of the CGL                                                                                                                                    | Comments from our insurance carrier/broker.                                                                                                                                                               |
| 28  | 12.1.1 b. ii. 20)  | Renumber this to be 12.1.1 e and then renumber the remaining numerals below it                                                                                                                                                                                              | Pollution Liability would be a separate coverage from the CGL                                                                                                                                          | Comments from our insurance carrier/broker.                                                                                                                                                               |
| 29  | 12.2.1             | Change " in any way arising out of this Agreement or the Work, including but not limited to the acts" to "to the extent caused by the negligent acts" At the end of the sentence, change the period to a comma and add: "in the performance of this Agreement or the Work." | This will result in an indemnity tied to the negligent acts of the Design/Build Entity and its subcontractors, resulting in an un-insurable risk.                                                      | Design/Build Entity cannot accept risks for which it cannot provide adequate risk transfer through insurance when such is available. This results in a more easily quantifiable risk mitigation solution. |
| 30  | 12.2.1 (i)         | First line, replace "or the design or " with "failure of the design to comply with the professional standard of care or defect in"                                                                                                                                          | Defects in design should be referenced in accordance with the professional standard of care in order to be covered by the Professional Liability policy.                                               | This is a design-build contract and thus certain aspects of a traditional construction contract must be revised to allow insurability of the                                                              |
| 31  | 12.2.1 (ii)        | Same as comment above                                                                                                                                                                                                                                                       | Same as comment above                                                                                                                                                                                  | Same as comment 22                                                                                                                                                                                        |
| 32  | 12.2.1 (iii)       | Change "of this Agreement" to "of the Proposal".                                                                                                                                                                                                                            | To be consistent with proposed change to Section 7.5.1. b .2                                                                                                                                           |                                                                                                                                                                                                           |
| 33  | 12.2.1 (vi)        | Delete and change to "not used".                                                                                                                                                                                                                                            | This is so broad that it will result in non-insurable events. Need to be tied to negligence which has been accomplished in the earlier provisions.                                                     |                                                                                                                                                                                                           |
| 34  | 14.4.3             | Change "Final Completion" to "Substantial Completion (as defined by the applicable statute)"                                                                                                                                                                                | Statute of repose should run in accordance with the statutory definitions.                                                                                                                             | The City of Morro Bay will have beneficial use of the facility once substantial completion is achieved.                                                                                                   |
| 35  | Exhibit C Guaranty | Upon selection, we may provide comments after review by corporate counsel.                                                                                                                                                                                                  | Attachment B Proposed DB Agreement                                                                                                                                                                     | Our Team can provide the parental guarantee and do not see any issues regardless of the final contract terms. However, until the final contract is negotiated we will wait comment on the guarantee form. |

## SCHEDULE A-1 COST

The following costs, whether on site or off-site, are included in the direct job costs of the project and are not part of the overhead fee regardless of how many hours per week they work on the project:

D-Design Costs (whether Black & Veatch or sub consultant including labor multiplier)

L-Project Manager (Gary Silverman)

L-Construction Manager (Chad Brown)

L- Safety Site Manager

L- Safety auditing L- QA/QC auditing

L- Scheduler

L- Craft Supervision

L- Construction detailing (both on-site and off-site including multiplier)

L -Craft Labor

L- Procurement Staff

L- Accounts Payable/Receivable/Payroll (on -site and off-site)

L- Project Cost Controls

L- Estimating costs for 60% GMP & 90% GMP

L- Estimating support for buyout

L- Contracts manager

L- Labor Burden and Fringes including workman's comp insurance, employee benefits/insurances, taxes ect.

M- Permanent Materials

M-Consumable Materials

E-Construction Equipment(owned or rented)

E- Vehicles for staff (owned or rented)

E- Small tools

S- Subcontractors (including sub bonds)

S- 3rd party inspections for soils, concrete, welding, structural and masonry

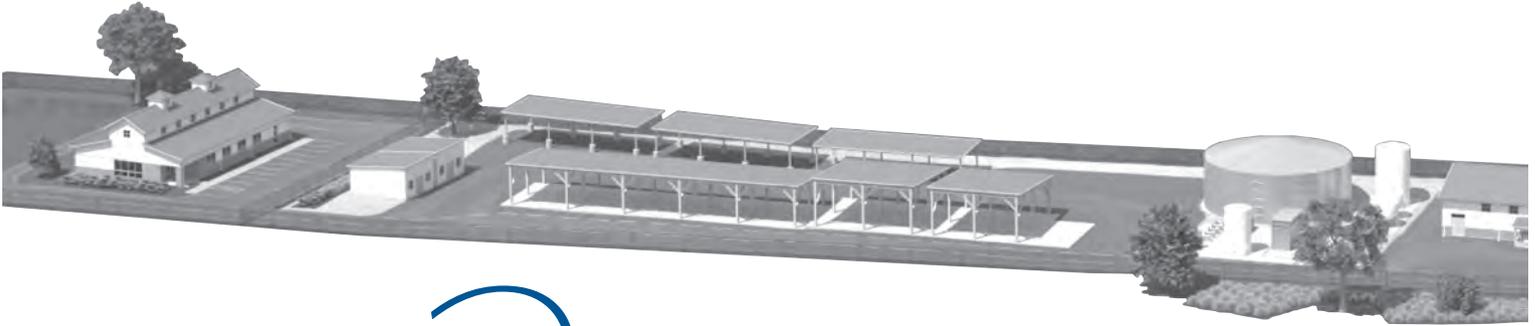

O- Insurance

O- Bonds

O- Permit Fees

O-Escalation costs

O- Contingency

APPENDIX

## 2.0 Introduction

### 2.1 BACKGROUND

The City of Morro Bay Water Reclamation Facility (WRF) is designed to treat an annual average flow of 0.97 million gallons per day (MGD) of wastewater through full advanced treatment. The WRF provides primary, secondary, tertiary and advanced treatment, and it produces recycled water meeting standards for a groundwater replenishment reuse project (GRRP) using subsurface application, as defined in California Code of Regulations (CCR) Title 22 recycled water requirements. The WRF is located at the South Bay Boulevard (SBB) site (Figure 1). Recycled water is conveyed to injection wells in the Morro Valley. An effluent pipeline conveys advanced treatment waste streams, including brine, to the existing Morro Bay Cayucos Sanitary District (MBCSD) jointly-owned ocean outfall at the site of the existing wastewater treatment plant (WWTP).

**Figure 1** Morro Bay WTF [REPLACE WITH CONCEPTUAL LAYOUT]

A process flow schematic is shown in Figure 2 and should be referenced throughout the commissioning plan.

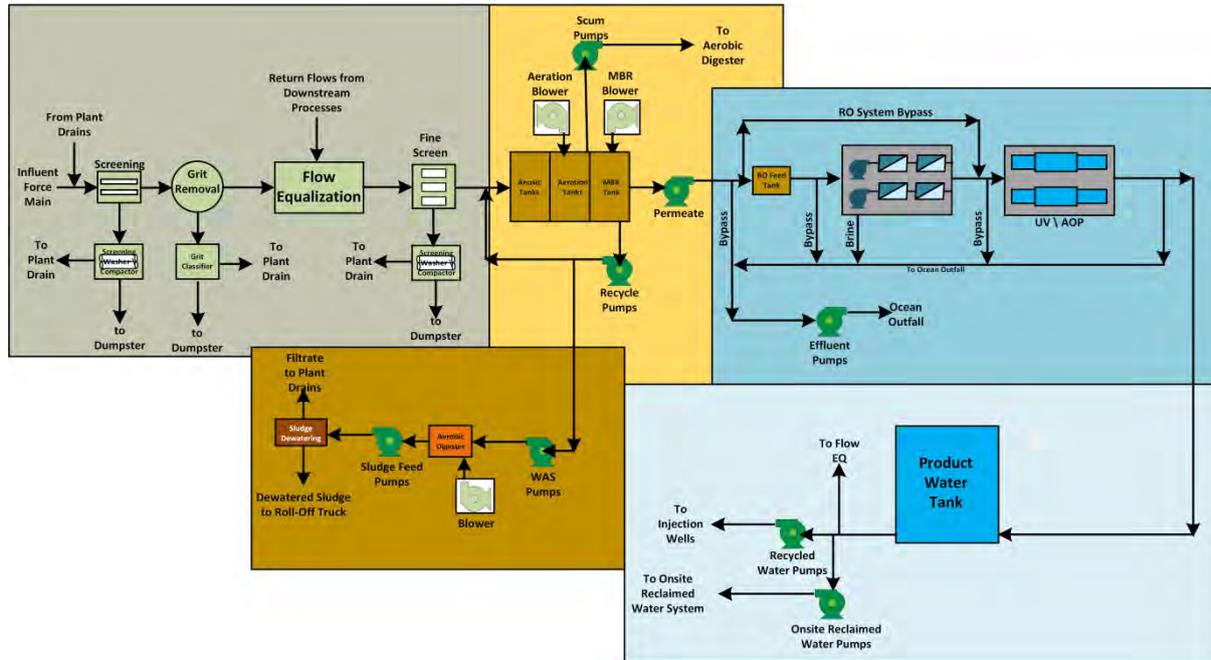

Figure 2 Process Schematic

DRAFT

## 3.0 Roles and Responsibilities

### 3.1 COMMISSIONING MANAGER

The roles and responsibilities of the commissioning manager include the following:

- Manage and direct operations and commissioning to achieve a successful project delivery.
- Manage all the phases of commissioning from construction handover to performance testing and ensure existing facilities remain operational.
- Provide leadership and technical direction to the commissioning staff.
- Liaise with the operator to achieve plant handover.
- Liaise with construction on meeting the schedule and ensuring the quality of the turnover packages.
- Interface with vendors to meet and commission the plant in accordance with the schedule.
- Ensure that the commissioning process is planned and carried out while meeting the scheduled dates.
- Provide accurate reports on the progress and status of the commissioning.
- Ensure final water quality and effluent quality is compliant with the specification.
- Ensure that the commissioning process is planned and carried out with the safety of all personnel considered.
- Ensure that the commissioning process is planned and carried out without any environmental incidents.
- Ensure that all Quality Assurance (QA) documents are properly completed and issued.
- Ensure compliance with regulatory and permit requirements.
- Ensure that the delivery process is planned and carried out with the safety of all personnel considered.
- Ensure that the delivery process is planned and carried out without any environmental incidents

### 3.2 OPERATIONS MANAGER

The roles and responsibilities of the operations manager include the following:

- Manage and maintain the operation of the treatment plant before client handover.
- Provide the main operations liaison post-plant handover to the client.
- Ensure the final water quality and effluent quality of both plants is compliant with the specification.
- Before any work is carried out, issue, approve and control access for any work in the treatment plant.
- Ensure lockout/tagout (LOTO) procedures are fully implemented and controlled.
- Act as the main point of contact between commissioning and operations.
- Ensure that the treatment plant operation is carried out with the safety of all personnel considered.

- Ensure that the treatment plant operation is carried out without any environmental incidents.
- Ensure compliance with regulatory and permit requirements.

### 3.3 I&C LEAD

- Provide leadership technical direction for the commissioning ICA trades.
- Ensure all I&C systems are tested, calibrated and verified correct for plant start up.
- Complete all activities and handover entire packages in accordance with the schedule
- Complete commissioning packs, records and QA documents in accordance with the system / turnover dates
- Verify and audit all construction turnover packages.
- Interface with vendors as required
- Provide assistance on start-up and commissioning activities to ensure the plant is available to run in accordance with the schedule.
- Ensure LOTO procedures are fully implemented and controlled.
- Ensure that the commissioning process is planned and carried out with the safety of all personnel considered.
- Ensure that the commissioning process is planned and carried out without any environmental incidents.

### 3.4 ELECTRICAL LEAD

The roles and responsibilities of the electrical lead include the following:

- Provide leadership and technical direction and systems for the commissioning electrical trades.
- Ensure all electrical systems are tested, calibrated and verified correct for plant startup.
- Complete all activities and submit the entire package in accordance with the schedule
- Complete commissioning packs, records and QA documents in accordance with the system/turnover dates.
- Verify and audit all construction turnover packages.
- Interface with vendors as required.
- Provide assistance on startup and commissioning activities to ensure the plant is available to run in accordance with the schedule.
- Ensure LOTO procedures are fully implemented and controlled.
- Ensure that the commissioning process is planned and carried out with the safety of all personnel considered.
- Ensure that the commissioning process is planned and carried out without any environmental incidents.

### 3.5 SCADA LEAD

The roles and responsibilities of the supervisory control and data acquisition (SCADA) Lead include the following:

- Provide leadership and technical direction to the commissioning programmers.

- Report to and work with the I&C lead on pre-startup testing and functions.
- Report to and work with the process start on commissioning issues and changes.
- Ensure all SCADA Programmable Logic Controller (PLC) Site Acceptance Plans (SAT) are verified correct for plant startup.
- Audit the string logic on the SATs.
- Review and approve the SATs.
- Ensure vendor software packages are turned over and accessible.
- Verify that vendor software packages properly communicate what they need to.
- Complete all activities and submit the entire package in accordance with the schedule.
- Provide assistance on startup and commissioning activities to ensure the plant is available to run in accordance with the schedule.
- Ensure that the commissioning process is planned and carried out with the safety of all personnel considered.
- Ensure that the commissioning process is planned and carried out without any environmental incidents.

### **3.6 MB WRF OPERATIONS**

The city is responsible for the effluent quality. During the course of the acceptance test unit, operations will be directed by the district's certified operators. This responsibility includes the following:

- Liaison with the main operations manager during functional and acceptance testing.
- Maintain process integrity and effluent water quality.
- Provide operations support for WRF equipment operation that are not installed under this contract.
- Provide at least one operator for eight hours per day during the acceptance test period.
- Manage and maintain the operation of the treatment plant before client submit.
- Witness some or all of the tests and participate in the evaluation of the process performance.

- performance.

DRAFT

## 4.0 Safety

Safety will conform to the requirements of the site safety management plan with a focus on the following items.

### 4.1 RISK ASSESSMENTS

A risk assessment will be performed for all major commissioning activities to determine the following:

- Is there a danger to personnel?
- Is there a potential environmental impact?
- What procedures and work instructions apply to the activity?
- A safe work method for the activity.
- What safety equipment is required?
- What chemical are to be used?
- What equipment is to be used?
- What isolation lockout and tagging will be in place?
- Are there any confined space issues?

The risk assessment form should be complete and properly filed for records. The commissioning engineers shall liaise with the plant manager to ensure all site activities are included in any risk assessment considerations and each party is aware of the other's activities.

### 4.2 JOB SAFETY ANALYSIS (JSA)

JSAs should be filled out daily for each activity and reviewed with all personnel on site and be signed and dated.

Emphasis will be on:

- Consultation and talking to everyone about the daily activities.
- What is the process flow?
- What equipment is isolated?
- What safety equipment is required?
- What environmental controls are required?
- What chemicals are to be used and what precautions are required?
- What are the expected noise levels?
- The roles and responsibilities of all personnel involved.
- What to do in the event of an emergency.
- The JSA sheet will be signed by everyone working on the nominated tasks.

### 4.3 LOCKOUT AND TAGGING

For commissioning activities, the LOTO procedure should be enforced and properly managed.

- All electrical isolations should be locked, isolated and tagged.
- Mechanical equipment including valves and equipment should be isolated and tagged in accordance with the commissioning activities taking place. The commissioning engineer should be responsible for the placement and control of the danger/isolation tags.
- Process equipment should be isolated and tagged in accordance with the commissioning activities taking place. The commissioning engineer is responsible for the placement and control of the danger/isolation tags.

### 4.4 CONFINED SPACE

Where a working area is defined as a confined space by the risk assessment confined space, procedures will be enforced and in accordance and they will comply with current confined space regulations.

### 4.5 CHEMICAL STORAGE AND HANDLING

The site chemical register will be kept up to date to include all chemicals on site that will be used for both commissioning and plant startup. SDSs will be added for all new chemicals and instructions included on the JSA and induction meetings. Any personnel required to work on, in, and around chemicals will complete a site chemical introduction before working with the chemicals.

Spill response equipment should be available at chemical storage and handling areas.

### 4.6 SAFETY SYSTEMS FOR PLANT OPERATION

Once the treatment plant becomes operational, the treatment plant safety management system will be enforced. Construction safety systems protocols and procedures, where relevant, are to be moved under the umbrella of the Operations Treatment Plant Safety Plan.

Construction/punch list activities should be in accordance with the requirements of the operations team and the permits lock out procedures should be enforced. The operator should be advised of all activities taking place at the treatment plant and will make allowances for work that will be carried out in conjunction with operational requirements.

No work should be carried out on the treatment plant without a permit or permission issued from commissioning/operations team.

### 4.7 COMMUNICATIONS PROTOCOL

#### 4.7.1 Operations Emergency Procedure

To initiate an emergency call:

1. Dial emergency services: Fire/Police/Ambulance on 911 and, when answered, state "This is an emergency."
2. Tell emergency services:

- a. Your name.
- b. The location of emergency.
- c. The nature of emergency (Fire / First Aid / Rescue / Haz Chem Spill).
- d. What help is required.
- e. Stay calm and obey all directions given by emergency services.

To evacuate adjacent site construction areas and/or notify them of pending emergency services, contact the site radio control officer using: The emergency 2-way radio channel 1- (emergency channel) and state in a clear voice “EMERGENCY- EMERGENCY-EMERGENCY” or use phone number 555.1212 and, when answered, state “This is an emergency.”

**Emergency Contacts**

| POSITION                | NAME        | CONTACT NUMBER |
|-------------------------|-------------|----------------|
| Construction Manager    | Chad Brown  | 925.949.5419   |
| Commissioning Manager   | Jorj Long   | 913.458.2000   |
| Morro Bay Plant Manager | Joe Mueller | 916.826.3912   |

## 5.0 Commissioning

### 5.1 DEFINITIONS

| TERM                  | DESCRIPTION                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Construction Turnover | Construction complete, system walk down punch list, pressure testing, tank testing pipeline flushing and lubrication.                     |
| Pre-Commissioning     | Testing of individual equipment and plant on an equipment type basis or individual equipment type within a system.                        |
| Commissioning         | Generic term that includes all the commissioning phases.                                                                                  |
| Systems Commissioning | A period for the collaborative testing of multiple systems.                                                                               |
| Process Commissioning | A period for the testing of the whole plant to establish all water quality / process conditions in readiness for the performance testing. |
| Performance Testing   | Completed following commissioning. A 30 day test on whole plant where performance is monitored.                                           |

### 5.2 TURNOVER PACKAGES

#### 5.2.1 Turnover Package Definition

The complete turnover packages will be defined as highlighted marked up P&IDs.

#### 5.2.2 Turnover Package Handover

The following table lists the turnover packages.

| AREA | PACKAGE | SYSTEM DESCRIPTION                     |
|------|---------|----------------------------------------|
| 11   | 1       | Influent (Coarse) Screening            |
| 11   | 2       | Grit Removal                           |
| 11   | 3       |                                        |
| 11   | 4       | Fine Screening                         |
| 11   | 5       | Membrane Bioreactor (MBR)              |
| 11   | 6       | Aerobic Sludge Digester                |
| 11   | 7       | Sludge Dewatering                      |
| 11   | 8       | Reverse Osmosis                        |
| 11   | 9       | Ultraviolet Advanced Oxidation Process |
| 11   | 10      | Chemical Storage and Feed Facilities   |
| 11   | 11      | Odor Control                           |

### 5.3 CONSTRUCTION TURNOVER

A daily coordination meeting with representatives from each discipline will report progress and be accountable for each system submit. The aim of the meeting is to ensure the package submission is on time and to flag any issues early so they can be addressed.

The construction teams will turn over the packages to commissioning on the agreed dates. It is the responsibility of the area engineer to complete all the tasks and sign off a finished package/system; it's not the responsibility of commissioning to verify on behalf of construction whether systems are complete or correct. This is assumed.

Commissioning will attend and review the system and walk it down only when it's complete, as listed below, and the paperwork is complete and presented as a package. Any system or package found not to conform to the P&ID's drawings and specifications will be returned to construction for rectification and the responsible engineer will have to account for why it does not conform to the design.

Any additional work identified by commissioning that was not in the original design will be subject to a Request For Information (RFI) and site instruction.

The following tasks should be complete before submitting.

### 5.3.1 Civil

- Complete all construction activities in accordance with the schedule.
- Complete, check and sign off plant for compliance with the drawings specifications and site instructions.
- Complete and sign off all QA paperwork and construction records.
- Complete and issue "As built" drawings.
- Forward all paperwork to the project compliance manager.
- Water testing of all concrete tanks should be in accordance with the water testing procedure.
- Repair any structures that fail and retest.
- Punch list inspect each unit, identify defects, and correct.
- Outstanding defects should be entered into defects log.
- Sign off and handover the turnover package part as complete.

### 5.3.2 Mechanical

- Complete all construction activities in accordance with the schedule.
- Complete check system and sign off system for compliance with P&IDS GA drawings specifications and site instructions.
- Complete and sign off all QA paperwork ITPs and construction records.
- Complete and issue "As built" drawings.
- Forward all paperwork on to the QA department.
- Walk down each system, identify punch list items, and begin fixing the defects.
- Outstanding defects should be entered into the defects log.
- Hydraulic test of tanks. Invite commissioning to witness.
- Hydraulic and or pressure test all pipelines. Invite commissioning to witness.
- Flush and clean tanks and piping. Invite commissioning to witness.
- Purge all lines, as required. Invite commissioning to witness.

- Seal up each system and sign off as complete and ready for submission. Invite commissioning to witness.
- Clean up each area bund off.
- Sign off and submit the turnover package part as complete.

### 5.3.3 Electrical / Instrument

- Complete all construction activities in accordance with the schedule.
- Complete all testing and verification. Invite commissioning to witness.
- Complete all QA documentation to verify labelling connections and point-to-point testing.
- Complete and check system and sign off system for compliance with P&ID drawings specifications and site instructions.
- Complete and issue “As built” drawings.
- Walk down each system, identify punch list items, and initiate defect rectification.
- Outstanding defects should be entered into the defects log.
- Sign off and hand over the turnover package part as complete.

DRAFT

#### 5.3.4 Process Startup

- Startup and coordinate operation with the city's plant manager.
- Test the plant and verify the process.
- Perform collaborative tests on individual and multiple systems and packages.
- Establish water and effluent flow in accordance with the design.
- Establish the chemical dosing process.
- Structure and control lab testing from the sample points.
- Provide leadership and technical direction to operations, commissioning and the client.
- Run optimize and fine tune the plant ready for the performance trial.
- Ensure the plant performs and passes the performance trial.
- Monitor compliance of final water quality and effluent quality with the specification and regulations and report non-compliances to commissioning manager.
- Liaise with commissioning for defect resolution.
- Liaise with and provide direction to vendors to meet process and contractual requirements.
- Hand over the plant to operations with an accurate set of operation instructions.
- Correct and revise all controlled process documents.
- Ensure that the operations activities are planned and carried out with the safety of all personnel considered.
- Ensure that operations are planned and carried out without any environmental incidents.

#### 5.4 HANDOVER COMPLETION

- Provide leadership and technical direction for the commissioning trades.
- Ensure startup activities are planned and carried out and meet the scheduled dates.
- Liaise, direct, and control vendors to meet and commission plant in accordance with the schedule.
- Document that final water quality and effluent quality is compliant with the specification.
- Ensure LOTO procedures are fully implemented and controlled.
- Ensure that the commissioning process is planned and carried out with the safety of all personnel considered.
- Ensure that the commissioning process is planned and carried out without any environmental incidents.

## 5.5 ACCEPTANCE TEST TURNOVER

- Provide leadership, technical direction, and systems for commissioning.
- Ensure startup activities are planned and carried out and meet the scheduled dates.
- Liaise, direct, and control vendors to meet and commission the plant in accordance with the schedule.
- Document that final water quality and effluent quality is compliant with the specification.
- Ensure LOTO procedures are fully implemented and controlled.
- Ensure that the commissioning process is planned and carried out with the safety of all personnel considered.
- Ensure that the commissioning process is planned and carried out without any environmental incidents.

## 5.6 CONSTRUCTION TURNOVER

- Ensure that all construction teams complete activities on time and handover systems in accordance with the turnover package schedule.
- Ensure the handed over system is fully complete as required by this document.
- Provide leadership and technical direction to the package engineers and construction staff.
- Liaise with commissioning on turnover package progress and be accountable for dates.
- Hand over all documentation complete and properly signed in accordance with the turn over schedule.
- Ensure that the construction activities are planned and carried out with the safety of all personnel considered.
- Ensure that the construction activities are planned and carried out without any environmental incidents.

## 6.0 Functional Acceptance Test

The functional acceptance test (FAT) purpose is to insure that the PLC and Operator Graphics software configuration is working in conjunction with the hardware and plant as intended. This test is accomplished with the system on-line under normal operating conditions using clean water.

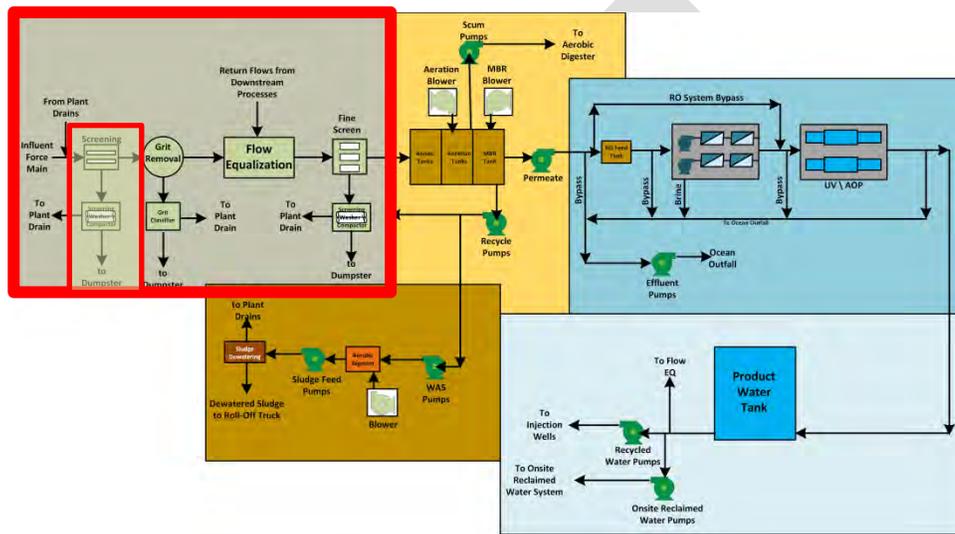

The plant systems, as defined as the turnover packages, will be prioritized based on the construction schedule and turnover status. A detailed step-by-step commissioning procedure will be developed by the commissioning team. These activities, to be completed for each section or system, will typically be a functional test of each system/area.

- For hardwired systems, this will consist of local panel functional testing of batching systems and local control.
- For PLC/SCADA systems, this will consist of PLC/SCADA automatic operation and testing from the operator's interface panel/SCADA.
  - In both cases, the compliance with the intended control and operation will be recorded on the functional specification and supporting documents generated by the software developers. e.g. Loops drawings and ITPs.
  - A record of alarms tested will be kept by highlighting and signing off a copy of the alarm schedule in the functional specification.
  - SCADA screens will be reviewed for functionality on a system-by-system basis.
- Dosing pump calibration will be completed. Calibration curves should be generated.
- System performance assessment.
  - Are systems stable?
  - Is the batching/pumping appropriate for the process?
  - Are there pressure surges or excess vibration?

## 7.0 Process Commissioning

### 7.1 HEADWORKS AREA – COARSE SCREENINGS

The headworks receives raw sewage from the influent main (IM). The flow is combined with plant drainage and directed into the screenings channels. The channels are equipped with mechanical bar screens that have a dedicated screenings washer/press. Screenings are directed to a washer/compactor before discharging into a dumpster. The screenings channels have removal covers to contain odor and direct the odorous air to the headworks odor control system. The screenings system may be bypassed by directing flow to the screenings effluent channel.

The Vector Washdown Area provides a location for dumping sewage from the utility’s vector trucks. The Vector Washdown Area has two areas, each sized to allow washdown of a full vector truck, with sloping concrete floors draining to a sump. The sump is connected to the plant drain system to transport materials to the headworks.

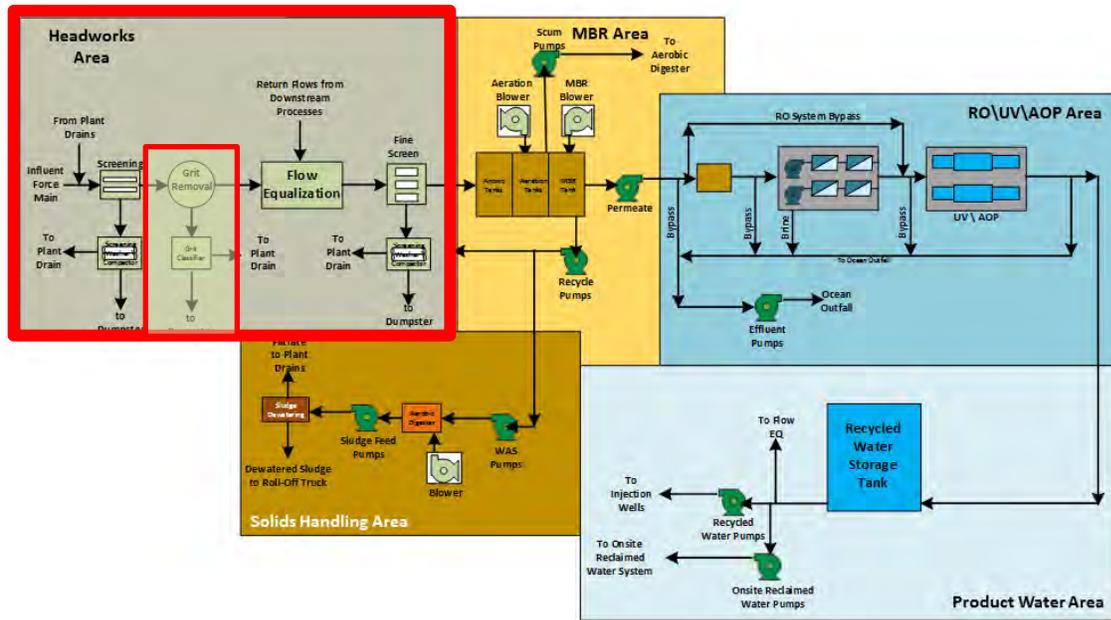

| HEADWORKS AREA COARSE SCREENINGS                                                                                                                        |            |          |               |             |                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------|---------------|-------------|-----------------------------|
| ACTIVITY                                                                                                                                                | TEST MEDIA | FLOW MGD | SOURCE        | DISPOSAL    | REQUIRED PRECEDENT ACTIVITY |
| <b>Initial Equipment Testing:</b><br>Bar Screens<br>Washer/Compactors<br>Screenings Container<br>Vector Truck Dump<br>Gates & Valves<br>Instrumentation | NA         | NA       | NA            | Plant Drain | Construction                |
| FT                                                                                                                                                      | PW         | ADWF     | Potable Water | FEQ         | Initial Testing             |

| HEADWORKS AREA COARSE SCREENINGS                                                                                                                                                                                                                                                                                                                                         |            |              |           |          |                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|--------------|-----------|----------|-----------------------------|
| ACTIVITY                                                                                                                                                                                                                                                                                                                                                                 | TEST MEDIA | FLOW MGD     | SOURCE    | DISPOSAL | REQUIRED PRECEDENT ACTIVITY |

## 7.2 HEADWORKS AREA – GRIT REMOVAL

The Grit Removal Facility receives screened flows and separates grit from the influent stream. The process is important because grit carried over to downstream processes can cause excessive wear and tear on equipment, which requires expensive replacement parts and excessive time out of service. Additionally, excessive grit accumulation can reduce the effectiveness of the MBR and aerobic digester. Grit slurry is pumped to grit separator / washer and the grit separated from organic material is stored in a dumpster. The degritted flow is discharged to the Splitter Box.

### 7.3 HEADWORKS AREA – SPLITTER BOX

Degritted flows and SAFE are discharged to the Splitter Box. A weir in the box is set to divert high flows to the SAFE for treatment. The box allows the plant to mitigate diurnal flow variations and reduce peak loadings that occur over a 24-hour period. The process also helps to maintain constant flow and loadings on the MBR during peak flow events and supplement flow to the basins with stored screened and degritted flows during low flow periods. Normally Splitter Box flow is directed to Fine Screen 1, alternatively flow can also be discharged to Fine Screen 2.

### 7.4 HEADWORKS AREA – FINE SCREENS

The fine screens receive flow from the Splitter Box. The screens collect, wash, dewater, compress, convey, and discharge solids to a screenings container. There is one screenings washer compactor dedicated to each screen. Screened wastewater flows are discharged to the MBR. Sodium hydroxide can be added to the screened effluent channel to control wastewater pH. Fine screens are used to insure the MF modules do not get blinded or damaged which would reduce flow to the MBR.

## 7.5 MEMBRANE BIOREACTOR AREA - MBR

The MBRs are a combination of a suspended growth biological treatment method using activated sludge, with membrane filtration equipment. Flows that have passed through fine screens are metered into the secondary system (MBRs). Wastewater passes through basins with different environmental conditions. The MBR effluent, called filtrate, is discharged to the RO Feed Tank that acts as a reservoir to the RO system

Morro Bay WWTP activated sludge system biomass will be evaluated for use as seed to start the MBR. Should the biomass be have poor settling characteristics alternative sources will be evaluated which could include other wastewater treatment plants or starting the system with bacteria naturally present in the waste waters.

## 7.7 REVERSE OSMOSIS (RO) / ULTRAVIOLET ADVANCED OXIDATION PROCESS (UVAOP) AREA – RO SYSTEM

The RO system is fed from the MBRs. Flow is received at the RO Feed Tank which stores MBR permeate. RO removes dissolved constituents from the influent water, which achieves permeate salinity control and additional pathogen log removal credits. The RO feed water is pretreated with cartridge filters to protect the RO membranes against damage from large particles. Finally, the water is pressurized and passed through three stages of RO membrane elements with a pressure boost before the third stage to achieve flux balance. RO permeate (ROP) is discharged to the the UVAOP for disinfection.

- TOC < 0.25 mg/L
- UVT > 95%
- Minimum Capacity: 0.67 MGD
- Maximum Average Design Flux: 12 GFD
- Maximum Single Element Flux: GFD
- Recovery: 80%

### 7.8 RO\UV\AOP AREA –UVAOP

The UVAOP receives water from the RO system, or directly from the MBR System. The UVAOP provides two mechanisms for treating organic contaminants – direct photolysis and oxidation with sodium hypochlorite. Hypochlorite is fed ahead of the UV units. Using the combined technology RO permeate is disinfected prior to ocean outfall and indirect potable reuse.

Sodium hydroxide is added to lower the pH to reduce the corrosive nature as water is conveyed distribution areas. Sodium hypochlorite is added breakpoints any remaining chloramine and maintains chlorine residual in the distribution system.

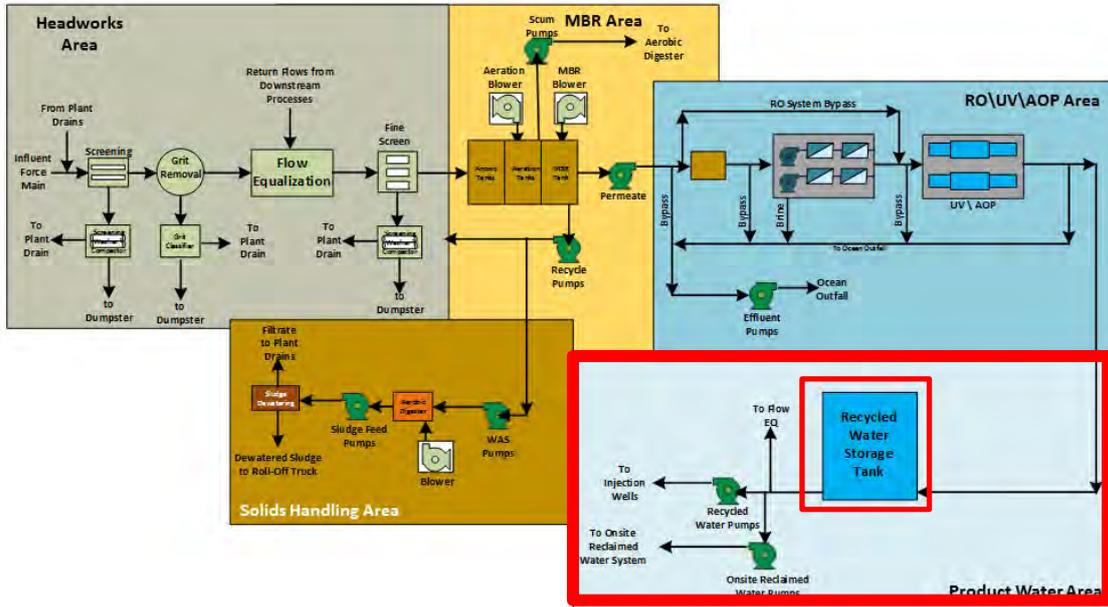

| PRODUCT WATER AREA - STORAGE                                                                                                                                                   |               |          |        |                                       |                                           |

### 7.11 STORMWATER ADAPTIVE FILTRATION EQUIPMENT (SAFE)

The process objective is to perform auxiliary filtering of peak flows beyond the capacity of the biological treatment process and deliver the treated flow to the ocean outfall. The system is comprised of a disk filtration unit, backwash pump and solids pump. Filter solids are removed from the system and wasted to the Headworks Splitter Box. Scum and backwash filter are directed to the plant drain.

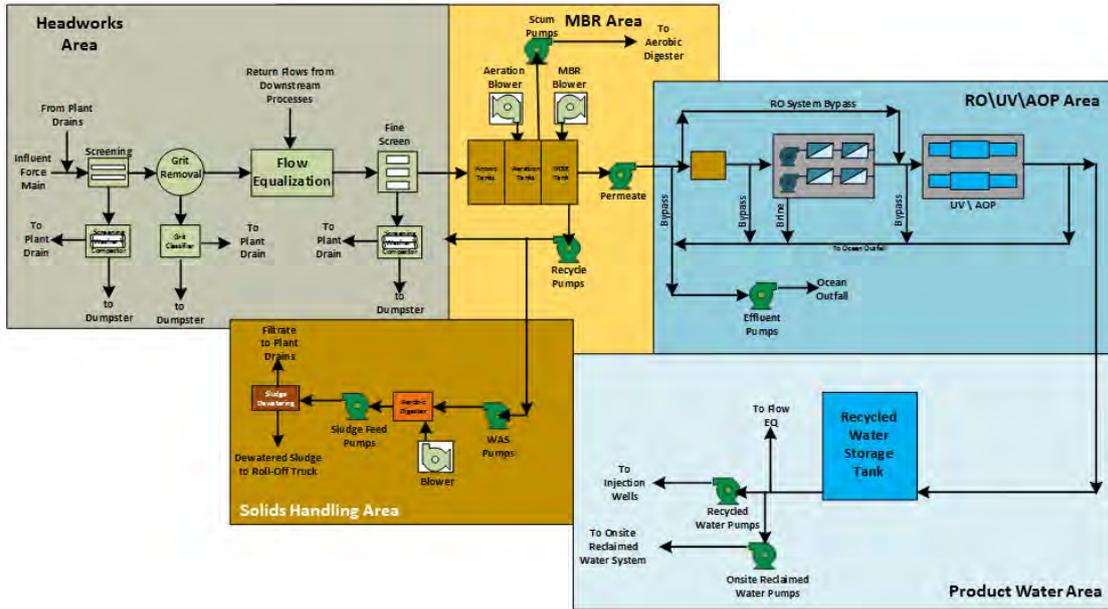

| PRODUCT WATER AREA – SAFE                                                                                 |                             |                |              |                  |                                              |

### 7.12 OCEAN OUTFALL SYSTEM

The ocean outfall system handles RO Feed Tank overflow, SAFE effluent and RO concentrate. RO Feed Tank overflow and SAFE flows are discharged to the Outfall Balancing Tank which is then transferred to the ocean outfall by the Balancing Pumps. Both flows are treated with sodium hypochlorite for disinfection then dechlorinated with sodium bisulfite prior to ocean outfall.

## 8.0 Solids Handling Area

### 8.1 SOLIDS HANDLING AREA – AEROBIC SLUDGE DIGESTER

Aerobic digestion is a biological treatment process that uses long periods of aeration to stabilize and reduce the mass of organic waste by biologically destroying volatile solids. This process extends decomposition of solids and regrowth of organisms to a point in which available energy in active cells and storage of waste materials is sufficiently low to permit waste sludge to be considered stable. The digester receives, stores, aerates, and digests activated sludge wasted from the MBR process. The digester freeboard/head space will be minimized to reduce potential for odor accumulation.

## 8.2 SOLIDS HANDLING AREA- SLUDGE DEWATERING

Belt filter presses are used to dewater solids from digested waste activated sludge. The purpose of dewatering is to decrease the volume of solids hauled offsite by removing a portion of the water contained.

DRAFT

## 9.0 Acceptance Testing

While the intent is to execute the acceptance test on schedule, there are certain external factors that may influence how the test is conducted. The acceptance test plan and schedule will be developed with the input of the city.

After all certification, functional, and equipment tests have been performed and all equipment has successfully met startup requirements, acceptance testing should be completed. The acceptance test consists of a two week period where the facility operates as a complete system. Acceptance testing shall start after the acceptance test plan has been approved by the city and regulatory agencies, and authorization has been received from the city. After successful completion of the acceptance test, the transitional operation phase will begin.

The WRF shall be operated as follows:

- Demonstrate the WRF achieves permitted conditions under normal operation.
- Demonstrate emergency generator operation. Effluent quality and capability to process the influent should not be diminished due to an automatic transfer to the emergency generator.
- Demonstrate the uninterruptible power supply (UPS) for power and controls performs without loss of data and control.
- Demonstrate manual shutdown, manual startup, automatic shutdown, automatic startup, and automatic transfer of equipment that requires any or all of those functions without interruption of flow or quality of effluent.
- Reports should be developed in accordance with the requirements of the regulatory agencies with certification of the results demonstrating performance, all relevant data measured and recorded during the testing, and any calculations that were used in determining test results.

## 10.0 Water Quality Maintenance

### 10.1 FAILSAFE FEATURES

In the Morro Bay WTF preliminary design provisions were made to ensure that public health protection is maintained, even under failure conditions. Failsafe features utilize information from the critical control point (CCP) monitoring to rapidly identify periods when the advanced treated water does not meet (or cannot demonstrate) specifications (“off-specification” flows). This information is used to trigger the implementation of a failsafe (resiliency) feature that responds by preventing release of off-specification water. Failsafe features provide greater operational flexibility by allowing the plant to experience failures, but in such a way that it does not threaten public health. The specific failsafe features planned for Morro Bay WTF include facilities to divert off-specification water.

### 10.2 MEASURES FOR PATHOGEN CONTROL AND OFF-SPECIFICATION WATER MONITORING

1. This design aims to routinely achieve pathogen log reduction values in excess of the minimum log reductions that would be required. The intent of this design strategy is to provide a buffer so that even if an individual process or monitor fails, the facility does not generate off-specification water.
2. In order to monitor for off-specification water, CCPs using industry established surrogates will be used to provide assurance that each process is providing the anticipated performance as a pathogen barrier. Surrogates are used because direct real-time monitoring of pathogens is not practical and surrogates are the standard approach to demonstrate compliance with log removal requirements in conventional drinking water treatment plants.
3. Each CCP is monitored using an established monitoring technique and verification of its performance is used to establish pathogen log reduction credits during operation. The table below summarizes the CCPs envisioned for the MB WTF, and a brief description of each of these CCPs is provided in the following paragraphs.

The following subsections describe failsafe features.

#### 10.2.1 Measures for Pathogen Control and Off-Specification Water Monitoring

MB WTF design centers on the concept of consistently achieving pathogen log reduction values in excess of the minimum log reduction that would be required. With this design strategy, the WTF will have a buffer so that even if an individual process or monitor fails, the facility will not generate off-spec water. Facility operation includes the CCPs, the CCPs envisioned which are elaborated on below.

#### 10.2.2 Use of SCADA in the Critical Control Point Management Process

Using monitoring data for flow and for surrogates at all the CCPs, SCADA will be used to continuously calculate and display the plant’s performance in meeting its performance goals. Each surrogate for each CCP will be separately displayed and, using colors and flashing lights, SCADA will provide operational staff with a clear picture of the WTF status as a whole as well as each CCP. Operators will know where they stand at all times.

### 10.2.3 Facilities for Diversion of Off-Specification Water

Off-spec water could be produced at the following CCPs in the treatment process:

- MBR.
- RO.
- UV/AOP.
- Product Water Tank

In the event MBR does not meet RO water quality requirements the RO supply line from the RO Feed Tanks can be closed causing the tank to overflow. The off-spec MBR effluent is directed to the Ocean Outfall Pump Station. Each of the RO trains is provided with a ROP dump to discharge any off-spec water to the ocean outfall system. Should the UVAOP effluent be off-spec the RO system would be stopped until water quality issues are resolved. As with ROP that is off-spec flow is directed to the ocean outfall system. In the event the Product Water Tank contains off-spec water the tank can be isolated and the flow returned to the plant by the sewers or directed to the Outfall wetwell. Using the CCP methodology there are multiple opportunities to safely intercept and divert off-spec flows without sending it to the groundwater IPR or distribution system.

## 10.3 SAMPLING AND SITE LABORATORY TESTING

Sample collection and site laboratory testing will be conducted in accordance with the sample collection program.

### 10.3.1 Raw Water Characteristics

Raw water characteristics and flows are as follows.

| PARAMETER               | ANNUAL AVERAGE | MAXIMUM MONTH |
|-------------------------|----------------|---------------|
| Flow, MGD               | 0.85           | 1.02          |
| BOD <sub>5</sub> , mg/L | 440            | 470           |
| TSS, mg/L               | 490            | 540           |
| TKN, mg/L               | 70             | 74            |

### 10.3.2 Online Monitoring

The process will be measured with the respective analyzers for water quality. The analyzers will generally measure turbidity, pH, conductivity, ORP, chlorine residual, ammonia, and other parameters. All analytical measured signals will be transmitted to SCADA or the process area PLC. All process measurements that are required to meet permit requirements will have redundant analytical instruments to ensure that no instrument failure results in a permit violation.

Table 10-1 lists the locations and purpose of the online analyzers.

| TABLE 10-2 ONLINE ANALYZERS |                                                                                                                                                                                                                                                |                                                                                                |

### 10.3.3 Site Testing

The Morro Bay WTF process field sampling schedule is provided in the table below.

**Table 10-3 Morro Bay WTF Process Control Liquid Sampling Schedule**

| PARAMETER                     | FREQUENCY | SAMPLE TYPE |
|-------------------------------|-----------|-------------|
| <b>Plant Influent</b>         |           |             |
| Alkalinity, mg/L              | Daily     | Composite   |
| BOD, mg/L                     | Daily     | Composite   |
| TSS, mg/L                     | Daily     | Composite   |
| COD, mg/L                     | Daily     | Composite   |
| TKN, , mg/L                   | Daily     | Composite   |
| pH, std. units                | Daily     | Grab        |
| <b>MBR Effluent</b>           |           |             |
| Alkalinity, mg/L              | 3/week    | Composite   |
| Total BOD <sub>5</sub> , mg/L | 3/week    | Composite   |
| COD, mg/L                     | 3/week    | Composite   |
| NH <sub>3</sub> -N, mg/L      | 3/week    | Composite   |
| Phosphorus                    | 3/week    | Composite   |
| TKN, mg/L                     | 3/week    | Composite   |
| TSS, mg/L                     | 3/week    | Composite   |
| VFA, mg/L                     | 3/week    | Composite   |
| VSS, mg/L                     | 3/week    | Composite   |
| <b>RO Influent</b>            |           |             |
| SDI                           | Daily     | Grab        |
| <b>RO Effluent</b>            |           |             |
| Conductivity                  | Daily     | Grab        |
| Turbidity, NTU                | Daily     | Grab        |
| <b>UV/AOP</b>                 |           |             |
| pH                            | Daily     | Grab        |
| TSS, mg/L                     | Daily     | Composite   |
| <b>Final Effluent</b>         |           |             |
| Total BOD <sub>5</sub> , mg/L | 3/week    | Composite   |
| COD, mg/L                     | 3/week    | Composite   |

| PARAMETER                | FREQUENCY | SAMPLE TYPE |
|--------------------------|-----------|-------------|
| NH <sub>3</sub> -N, mg/L | 3/week    | Composite   |
| pH                       | 3/week    | Composite   |
| TSS, mg/L                | 3/week    | Composite   |

**Table 10-4 Morro Bay WTF Process Control Solids Sampling Schedule**

| PARAMETER               | FREQUENCY | SAMPLE TYPE |
|-------------------------|-----------|-------------|
| <b>Aerobic Digester</b> |           |             |
| TSS, mg/L               | Daily     | Grab        |
| VSS, mg/L               | Daily     | Grab        |
| <b>Belt Press</b>       |           |             |
| Solids, %               | Daily     | Grab        |
| Volatile Solids, %      | Daily     | Grab        |

### 10.3.4 Certified Laboratory Testing

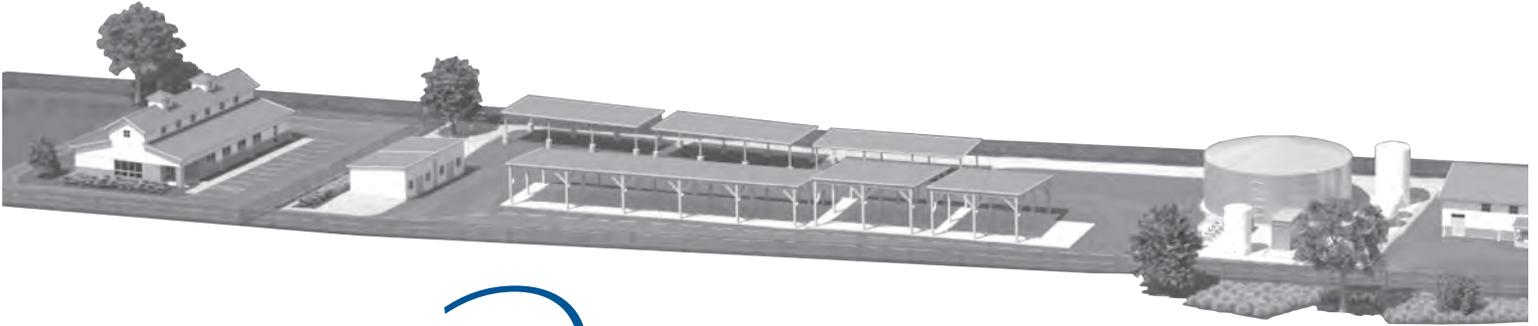

The sampling schedule for the certified lab is provided in the table below.

| TABLE 10-5 MORRO BAY WTF CERTIFIED LAB LIQUID SAMPLING SCHEDULE |             |                 |
|-----------------------------------------------------------------|-------------|-----------------|
| PARAMETER                                                       | FREQUENCY   | SAMPLE TYPE     |
| <b>Influent Monitoring</b>                                      |             |                 |
| Daily Flow, MGD                                                 | Daily       | Metered         |
| Maximum Daily Flow, MGD                                         | Daily       | Metered         |
| Mean Daily Flow, MGD                                            | Monthly     | Calculated      |
| BOD <sub>5</sub> (20 °C), mg/L                                  | Weekly      | 24-hr Composite |
| Total Suspended Solids, mg/L                                    | Weekly      | 24-hr Composite |
| <b>Outfall M-001</b>                                            |             |                 |
| Total Chlorine Residual, µg/L                                   | Daily       | Grab            |
| Total Coliform, MPN                                             | 5 Days/Week | Grab            |
| Temperature, °C                                                 | 5 Days/Week | Grab            |
| Turbidity, NTU                                                  | 5 Days/Week | Grab            |
| BOD <sub>5</sub> , 20 °C, mg/L                                  | Weekly      | 24-hr Composite |

**TABLE 10-5 MORRO BAY WTF CERTIFIED LAB LIQUID SAMPLING SCHEDULE**

| PARAMETER                                  | FREQUENCY | SAMPLE TYPE     |
|--------------------------------------------|-----------|-----------------|
| Total Suspended Solids, mg/L               | Weekly    | 24-hr Composite |
| pH                                         | Weekly    | Grab            |
| Settleable Solids, mL/L                    | Weekly    | Grab            |
| Grease and Oil, mg/L                       | Weekly    | Grab            |
| Chronic Toxicity, TUc                      | Annual    | 24-hr Composite |
| Ammonia (as N), mg/L                       | Annual    | Grab            |
| Nitrate (as N), mg/L                       | Annual    | Grab            |
| Urea (as N), mg/L                          | Annual    | Grab            |
| Ortho-Phosphate (as P), mg/L               | Annual    | Grab            |
| Dissolved Silica (SiO <sub>2</sub> ), mg/L | Annual    | Grab            |

## **Morro Bay WRF Process Performance Guarantees & Testing Protocols**

This section presents the process systems design envelope, process treatment performance guarantees and requisite testing protocols for the Morro Bay WRF designed and constructed by the FBV JV.

This document refers to the verification period for testing our guarantees in this document. The verification period is defined as the six month Performance and Operation Testing as described in Section 12.6 of the Performance Criteria Report.

### **Section 1: Conditions of the Process Treatment Performance Guarantee**

The Process Treatment Performance Guarantees presented in “Water Quality Guarantee Treatment Performance Guarantees” are subject to the following:

- i. Water quality guarantees are only provided for those samples collected at the sample locations noted in Table 6. Should other samples be collected by FBV and analyzed at other locations, those other samples, results and other related data shall not form part of or be considered in determining whether the water quality guarantees have been met.
- ii. Dewatered solids quality guarantee(s) noted in “Dewatered Solids Guarantees “ are only provided using those sludge samples collected at the locations indicated in Table 6. No guarantees are provided for any other sampling locations, or for samples collected or analyzed during the Facility Acceptance or Performance Testing Period. It is noted that FBV or their designees may collect, analyze and share results from sampling and analyses of samples collected at other locations for process monitoring purposes; these samples, results and other related data do not form part of the water quality guarantees, however.
- iii. All samples being used for guarantees will be handled and where necessary preserved in accordance with Standard Methods for the Examination of Water and Waste water, 21st edition (APHA). Failure to do so will result in such results not being admissible for the determination of the Process Treatment Performance Guarantees.
- iv. All analyses will be conducted in accordance with Standard Methods for the Examination of Water and Waste water, 21st edition (APHA) by a NELAC certified lab. Any non-standard tests will be conducted in accordance with written instructions and/or guidance provided by FBV staff or designees.
- v. The influent water quality shall fall within the design envelope listed in Table 1.
- vi. The influent shall contain no constituents, listed or unlisted, regulated or unregulated, which are deleterious or harmful to, inhibit, alter or interfere with any of the treatment processes of the Morro Bay WRF.
- vii. Development, completion, implementation or reporting of any occurrence studies related to the presence of regulated, unregulated, indicator or surrogate compounds in the collection or sewer system is not included the scope of FBV and shall not form any part of the Work under the Contract. Any such efforts required for regulatory or permit compliance are to be completed by the City of Morro Bay.
- viii. Operation and maintenance of all systems, equipment and components of the Morro Bay WRF must be in accordance with FBV Operations and Maintenance manuals and/or guidelines and/or requirements and/or recommendations and manufacturer system/equipment manufacturers’ manuals and recommendations.

- ix. The City of Morro Bay is responsible for implementing an effective Enhanced Source Control Program in accordance with 22 CCR § 60320.206, 22 CA ADC § 60320.206. The Enhanced Source Control program shall be developed by the City of Morro Bay and approved by California State Water Resources Control Board Division of Drinking Water prior to the startup and commissioning of the Morro Bay WRF.

**Table 1. Influent Water Quality Parameter Design Envelope during 6-month Performance Testing Period**

| Parameter                                                           | Unit   | Minimum Daily Value | 30-d Rolling Average | Maximum Monthly Average | Maximum Daily Value | Maximum Peak Hour |
|---------------------------------------------------------------------|--------|---------------------|----------------------|-------------------------|---------------------|-------------------|
| Influent Flow                                                       | MGD    | 0.40                | 0.87                 | 1.04                    | 2.08                | 7.90              |
| 5-day Biochemical Oxygen Demand (BOD <sub>5</sub> )                 | mg/L   |                     | 350                  | 370                     |                     |                   |
|                                                                     | lb/d   |                     |                      |                         | 4,700               |                   |
| 5-day Soluble Biochemical Oxygen Demand (Soluble BOD <sub>5</sub> ) | mg/L   |                     | 110                  | 135                     |                     |                   |
|                                                                     | lb/d   |                     |                      |                         | 1,650               |                   |
| Chemical Oxygen Demand (COD)                                        | mg/L   |                     | 700                  | 780                     |                     |                   |
|                                                                     | lb/d   |                     |                      |                         | 10,570              |                   |

**Table 1. Influent Water Quality Parameter Design Envelope during 6-month Performance Testing Period**

| Parameter                                | Unit                      | Minimum Daily Value | 30-d Rolling Average | Maximum Monthly Average | Maximum Daily Value | Maximum Peak Hour |
|------------------------------------------|---------------------------|---------------------|----------------------|-------------------------|---------------------|-------------------|
| Alkalinity                               | mg/L as CaCO <sub>3</sub> | 190                 | 200                  | 220                     | 270                 |                   |
| Temperature                              | °C                        | 17                  | 20                   | 21                      | 24                  |                   |
| Chloride (Cl <sup>-</sup> )              |                           |                     | 210                  | 240                     | 310                 |                   |
| Fluoride (F <sup>-</sup> )               |                           |                     | 0.25                 | 0.3                     | 0.8                 |                   |
| Sulfate (SO <sub>4</sub> <sup>2-</sup> ) |                           |                     | 100                  | 120                     | 155                 |                   |
| Iron                                     | mg/L                      |                     | 0.14                 | 0.20                    | 0.20                |                   |
| Magnesium                                | mg/L                      |                     | 60                   | 80                      | 90                  |                   |
| Calcium                                  | mg/L                      |                     | 150                  | 170                     | 185                 |                   |
| Potassium                                | mg/L                      |                     | 8                    | 12                      | 15                  |                   |
| Silica                                   | mg/L                      |                     | 7                    | 10                      | 20                  |                   |
| Sodium                                   | mg/L                      |                     | 120                  | 150                     | 190                 |                   |
| Aluminum                                 | mg/L                      |                     | 0.06                 | 0.07                    | 0.08                |                   |
| Barium                                   | mg/L                      |                     | 0.01                 | 0.01                    | 0.01                |                   |
| Manganese                                | mg/L                      |                     | 0.03                 | 0.03                    | 0.04                |                   |
| Strontium                                | mg/L                      |                     | 0.20                 | 0.30                    | 0.40                |                   |
| N-Nitrosodimethylamine                   | mg/L                      |                     | 30                   | 40                      | 65                  |                   |
| Allylthiourea                            | mg/L                      |                     | 2                    | 3                       | 3                   |                   |

## Section 2: Water Quality Guarantees

### Section 2.1: Ocean Discharge Effluent Quality

Ocean Discharge Effluent Quality will be demonstrated to meet the limits noted in Table 2 during the 6-month Performance Testing period.

- i. In the event that any of the Ocean Discharge Effluent Quality criteria are not met during the 6-month Performance Testing period due to:
  - a. failure of the City of Morro Bay to provide influent water which meets the conditions specified in Table 1 ; or
  - b. failure of the City of Morro Bay to operate and maintain the Morro Bay WRF in accordance with FBV Operations and Maintenance manuals and/or guidelines and/or requirements and/or recommendations and manufacturer system/equipment manufacturers' manuals and recommendations,

Then FBV shall be deemed to have met all water quality guarantees stated in Table 2 as of the date the Performance Testing period began.

**Table 2. Guaranteed Ocean Discharge Effluent Quality during 6-month Performance Testing Period**

| Parameter                                           | Unit       | Maximum Weekly Average       | Maximum Monthly Average | Maximum Daily Value  |
|-----------------------------------------------------|------------|------------------------------|-------------------------|----------------------|
| 5-day Biochemical Oxygen Demand (BOD <sub>5</sub> ) | mg/L       | 45                           | 30                      | --                   |
| Oil and Grease (FOG)                                | mg/L       | 40                           | 25                      | 75                   |
| Total Suspended Solids (TSS)                        | mg/L       | 45                           | 30                      | --                   |
| Settleable Solids                                   | mL/L       | 1.5                          | 1.0                     | 3.0                  |
| pH                                                  | S.U.       | 6.0-9.0                      | 6.0-9.0                 | 6.0-9.0              |
| Turbidity                                           | NTU        | 100                          | 75                      | 225                  |
|                                                     |            | <b>30-day Geometric Mean</b> |                         | <b>Maximum Value</b> |
| Total Coliform                                      | MPN/100-mL | 23                           |                         | 2,400                |

**Section 2.2: Groundwater Recharge Effluent Quality**

Groundwater Recharge Effluent Quality will be demonstrated to meet the limits expressly set forth in Table 3 during the 6-month Performance Testing period.

- ii. In the event that any of the Groundwater Recharge Effluent Quality criteria are not met during the 6-month Performance Testing period due to:
  - c. failure of the City of Morro Bay to provide influent water which meets the conditions specified in Table 1;
  - d. failure of the City of Morro Bay to meet all the stipulations noted in 8.1; or
  - e. failure of the City of Morro Bay to operate and maintain the Morro Bay WRF in accordance with FBV Operations and Maintenance manuals and/or guidelines and/or requirements and/or recommendations and manufacturer system/equipment manufacturers’ manuals and recommendations,

Then FBV shall be deemed to have met all water quality guarantees stated in Table 3 as of the date the 6-month Performance Testing Period began.

- iii. Log reduction values (LRV) for pathogens shall be calculated as shown in Equation (1), below.

$$LRV = \log_{10} \left[ \frac{\textit{Influent Pathogen Concentration}}{\textit{Groundwater Recharge Effluent Pathogen Concentration}} \right] \quad (1)$$

- a. Influent and Groundwater Recharge Effluent Pathogen Concentrations shall be determined using the respective grab samples designated for pathogen measurement (see Article 4).
- b. Samples at each sample location shall be collected in triplicate and the mean value of the pathogen concentration shall be utilized in Equation 1.
- c. For each sampling event, the groundwater recharge effluent grab sample set (a sample set consists of three replicate samples) shall be collected six (6) hours after the influent sample set is collected.

- d. Each of the three (3) replicate samples shall be collected a minimum of 15 minutes and a maximum of 30 minutes apart.
  - e. In such cases that the Groundwater Recharge Effluent pathogen concentration is at a level that does not permit demonstration of the requisite 3-log removal due to method detection limits, then FBV shall be deemed to have met all water quality guarantees stated in Table 3.
- iv. Log reduction values (LRV) for 1,4-dioxane shall be calculated as shown in Equation (2), below.

$$LRV = \log_{10} \left[ \frac{RO \text{ Permeate concentration of } 1,4 - \text{dioxane}}{Groundwater \text{ Recharge Effluent concentration of } 1,4 - \text{dioxane}} \right] \quad (2)$$

- a. RO Filtrate and Groundwater Recharge Effluent Pathogen Concentrations shall be determined using grab samples.
- b. Samples at each sample location shall be collected in triplicate and the mean value of the 1,4-dioxane concentration shall be utilized in Equation 2.
- c. For each sampling event, the groundwater recharge effluent grab sample set (a sample set consists of three replicate samples) shall be collected 6 – 8 minutes after the RO filtrate sample set is collected. Note that this interval will be confirmed based on the final design of the UV-AOP system prior to commencement of the acceptance or performance testing.
- d. Each of the three (3) replicate samples shall be collected a minimum of 3 minutes and a maximum of 6 minutes apart.
- e. Performance testing for the UV-AOP process using 1,4-dioxane LRV as described here shall be used to demonstrate successfully performance of the UV-AOP system only one (1) time during the 6-month performance testing period.
- f. In such cases that the influent concentration is at a level that does not permit demonstration of the requisite log removal based on measurements in the effluent due to method detection limits, then FBV shall be deemed to have met the requisite log removal value provided the effluent value is below the level of detection.

**Table 3. Guaranteed Groundwater Recharge Effluent Quality during 6-month Performance Testing Period**

| Parameter                                           | Unit   | Maximum Weekly Average                      | Maximum Monthly Average | Maximum Daily Value |
|-----------------------------------------------------|--------|---------------------------------------------|-------------------------|---------------------|
| Total Nitrogen (TN)                                 | mg-N/L | 10                                          | 10                      | 10                  |
| 5-day Biochemical Oxygen Demand (BOD <sub>5</sub> ) | mg/L   | 30                                          | 30                      | 30                  |
| Total Suspended Solids (TSS)                        | mg/L   | 5                                           | 5                       | 5                   |
|                                                     |        | <b>Minimum</b>                              |                         | <b>Maximum</b>      |
| pH                                                  | S.U.   | 6.5                                         |                         | 8.0                 |
|                                                     |        | <b>95% of Samples have Maximum Value of</b> |                         |                     |
| Total Organic Carbon (TOC)                          | mg/L   | 0.25                                        |                         |                     |
|                                                     |        | <b>Minimum Value</b>                        | <b>Notes</b>            |                     |
| Enteric Virus Reduction                             | log    | 11                                          | See Article 2.iv        |                     |
| Cryptosporidium Oocyst Reduction                    | log    | 10                                          | See Article 2.iv        |                     |
| Giardia Cyst Reduction                              | log    | 10                                          | See Article 2.iv        |                     |

|                                                     |        | <b>Minimum Value</b>                        | <b>Notes</b>            |                     |
| Langmuir Saturation Index                           |        | 0.00                                        |                         |                     |

**Section 3: Dewatered Solids Guarantees**

**Section 3.1: Dewatered Sludge Solids Concentration Guarantee**

- i. Thickened sludge/Dewatering Process Feed samples will be collected at the location and frequency noted in Table 6.
- ii. Dewatered sludge samples will be collected at the location and frequency noted in Table 6.
- iii. Dewatered sludge samples shall be collected during the period the dewatering process is operating. Samples shall be collected a minimum of one (1) hours after commencement of operation and a minimum of one (1) hour prior to cessation of operation.
- iv. The daily average dewatered solids concentration shall be calculated as the arithmetic average of the concentration of a minimum of two (2) samples collected during the period the dewatering process is operating.
- v. The monthly average dewatered solids concentration shall be calculated as the arithmetic average of the concentration of calculated daily average concentrations samples collected during the period the dewatering process is operating.
- vi. Dewatered sludge dry solids quality will meet the limits noted in Table 4 during the Performance Testing period. Solids quality criteria and parameters not expressly set forth in Table 4 are not guaranteed.

- v. In the event that any of the Dewatered Sludge Dry Solids criteria are not met during the 6-month Performance Testing Period due to:
  - f. failure of the City of Morro Bay to provide influent water which meets the conditions specified in Table 4;
  - g. Failure of the City of Morro Bay to meet all the stipulations noted in Section 1; or
  - h. failure of the City of Morro Bay to operate and maintain the Morro Bay WRF in accordance with FBV Operations and Maintenance manuals and/or guidelines and/or requirements and/or recommendations and manufacturer system/equipment manufacturers' manuals and recommendations,

Then FBV, shall be deemed to have met all the dewatered sludge solids guarantees stated in Table 4 as of the commencement date of the 6-month Performance Testing Period.

**Table 4. Guaranteed Dewatered Sludge Dry Solids Concentration during 6-month Performance Testing Period**

| Parameter                             | Unit | Minimum Monthly Average |
|---------------------------------------|------|-------------------------|
| Dewatered Sludge Solids Concentration | %    | 16                      |

**Section 3.2: Dewatering Process Solids Capture Efficiency**

Dewatering Process Solids Capture Efficiency will meet the limits expressly set forth in Table 5 during the Performance Testing period.

- vii. The Dewatering Process Solids Capture Efficiency will be calculated by comparison of the thickened sludge/dewatering process feed loading and suspended solids lost in the dewatering process return flow (i.e., filtrate and washwater)
- viii. Thickened Sludge/Dewatering Process Feed Loading shall be calculated as shown in Equation (3).
  - a. The average thickened sludge flow in Equation (3) will be calculated as the arithmetic average of the flow beginning one (1) hour after commencement of daily operation till one (1) hour prior to cessation of daily operation using the dewatering system feed flowmeter

$$\frac{\text{Thickened Sludge Feed Loading Rate } \left( \frac{\text{dry-tons}}{\text{d}} \right)}{\text{Average Thickened Sludge Flow } \left( \frac{\text{gal}}{\text{d}} \right) \times 8.343 \left( \frac{\text{lb-wet}}{\text{gal}} \right) \times \text{Dry Solids Content } \left( \frac{\text{lb-dry}}{\text{lb-wet}} \right) \times \frac{1}{2000} \left( \frac{\text{ton}}{\text{lb}} \right)} = \quad (3)$$

- ix. Sludge dewatering polymer feed rate shall be calculated as shown in Equation (4).

$$\frac{\text{Polymer Feed Rate } \left( \frac{\text{lb - Active Polymer}}{\text{d}} \right)}{\text{Polymer Dose } \left( \frac{\text{lb}}{\text{dry - ton}} \right) \times \text{Thickened Sludge Feed Loading Rate } \left( \frac{\text{dry - tons}}{\text{d}} \right)} = \quad (4)$$

- x. Sludge dewatering polymer dilution water feed rate shall be calculated as shown in Equation (5).

- a. The Polymer Density and Active Polymer Fraction are polymer specific values which will be determined prior to the prior testing period, during the acceptance testing period by FBV and/or its designees in conjunction with the dewatering equipment system supplier, dewatering polymer supplier and Morro Bay staff.

$$\frac{\text{Polymer Dilution Water Flowrate } \left(\frac{\text{gal}}{\text{d}}\right) = \text{Polymer Feed Rate } \left(\frac{\text{lb} - \text{Active Polymer}}{\text{d}}\right)}{\left(\text{Active Polymer Fraction } \left(\frac{\text{lb} - \text{Active Polymer}}{\text{lb} - \text{Polymer}}\right) \times \text{Polymer Density } \left(\frac{\text{lb} - \text{Polymer}}{\text{gal}}\right)\right)} \times \text{Polymer Dilution } (\%) \quad (5)$$

- xi. The dewatered sludge cake produced shall be calculated based on the Average Thickened Sludge Feed Loading Rate and an assumed solids capture rate of 95% as shown in Equation (6).

$$\begin{aligned} \text{Dewatered Sludge Cake Produced } \left(\frac{\text{dry} - \text{tons}}{\text{d}}\right) & \quad (6) \\ & = \text{Thickened sludge Feed Loading Rate } \left(\frac{\text{dry} - \text{tons}}{\text{d}}\right) \times \text{Capture Rate } (\%) \end{aligned}$$

- xii. The dewatered sludge wet cake produced shall be calculated based on the Dewatered Sludge Cake Produced and an assumed dewatered sludge concentration of 17% as shown in Equation (6).

$$\text{Dewatered Sludge Wet Cake Produced } \left(\frac{\text{wet} - \text{tons}}{\text{d}}\right) = \frac{\text{Dewatered Sludge Cake Produced } \left(\frac{\text{dry} - \text{tons}}{\text{d}}\right)}{\text{Dewatered Sludge Concentration } (\%)} \times \quad (7)$$

- xiii. The Dewatered Sludge Cake Water Content shall be calculated as shown in Equation (8).

$$\frac{\text{Dewatered Sludge Cake Water Content } \left(\frac{\text{gal}}{\text{d}}\right) = \left[ \text{Dewatered Sludge Wet Cake Produced } \left(\frac{\text{wet} - \text{tons}}{\text{d}}\right) - \text{Dewatered Sludge Cake Produced } \left(\frac{\text{dry} - \text{tons}}{\text{d}}\right) \right] \times 2,000 \left(\frac{\text{lb}}{\text{ton}}\right)}{8.343 \left(\frac{\text{lb}}{\text{gal}}\right)} \quad (8)$$

xiv. The Filtrate Flow shall be calculated as shown in Equation (9).

$$\begin{aligned} & \text{Filtrate Flow } \left(\frac{\text{gal}}{\text{d}}\right) = \\ & \text{Average Thickened Sludge Flow } \left(\frac{\text{gal}}{\text{d}}\right) + \text{Polymer Dilution Water Flowrate } \left(\frac{\text{gal}}{\text{d}}\right) \\ & \quad - \text{Dewatered Sludge Cake Water Content } \left(\frac{\text{gal}}{\text{d}}\right) \end{aligned} \quad (9)$$

xv. The Filtrate Solids Concentration shall be calculated as shown in Equation (10).

a. The Filtrate TSS Concentration shown in Equation (10) will be calculated using samples as indicated in Table 6.

$$\begin{aligned} & \text{Filtrate Solids Content } \left(\frac{\text{lb}}{\text{d}}\right) \\ & \text{Filtrate Flow } \left(\frac{\text{gal}}{\text{d}}\right) \times 8.343 \left(\frac{\text{lb}}{\text{gal}}\right) \times \text{Filtrate TSS Concentration } \left(\frac{\text{mg}}{\text{L}}\right) \end{aligned} \quad (10)$$

xvi. The Dewatering Process Solids Capture Efficiency shall be calculated as shown in Equation (11).

$$\text{Solids Capture Efficiency (\%)} = \frac{\left[\text{Thickened Sludge Feed Loading Rate } \left(\frac{\text{dry-tons}}{\text{d}}\right) \times 2,000 \left(\frac{\text{lb}}{\text{ton}}\right)\right] - \text{Filtrate Solids Content } \left(\frac{\text{lb}}{\text{d}}\right)}{\left[\text{Thickened Sludge Feed Loading Rate } \left(\frac{\text{dry-tons}}{\text{d}}\right) \times 2,000 \left(\frac{\text{lb}}{\text{ton}}\right)\right]} \quad (11)$$

xvii. The monthly average Dewatering Process Solids Capture Efficiency shall be calculated as the arithmetic average of the calculated daily average Dewatering Process Solids Capture Efficiency calculated for all days when the dewatering process is operational.

xviii. In the event that the Dewatering Process Solids Capture Efficiency criteria is not met during the 6-month performance testing period due to:

- i. failure of the City of Morro Bay to provide influent water which meets the conditions specified in Section 1;
- j. Failure of the City of Morro Bay to meet all the stipulations noted in “Conditions of the Process Treatment Performance Guarantee”; or
- k. failure of the City of Morro Bay to operate and maintain the Morro Bay WRF in accordance with FBV Operations and Maintenance manuals and/or guidelines and/or requirements and/or recommendations and manufacturer system/equipment manufacturers’ manuals and recommendations,

Then FBV shall be deemed to have met all the dewatered sludge solids guarantees stated in Table 5.

**Table 5. Guaranteed Dewatering Process Solids Capture Efficiency during 6-month Performance Testing Period**

| Parameter                                    | Unit | Minimum Monthly Average |
|----------------------------------------------|------|-------------------------|
| Dewatering Process Solids Capture Efficiency | %    | 95                      |

**Section 4: Sampling Locations and Collection Requirements**

- i. Samples shall be collected at the locations and at the sampling frequency noted in Table 6.
- ii. Final sampling locations will be developed in collaboration with Morro Bay staff during the design process and indicated on a sampling diagram prior to the acceptance and/or performance testing period.
- iii. Finalized sampling locations for regulatory mandated samples will be confirmed by the Regional Water Quality Board.

**Table 6 Sampling Locations, Sample Types and Sampling Frequency during 6-month Performance Testing Period**

| Sample Identification                                            | Sample Type/<br>Matrix | Sampling Location                        | Sample Type                         | Sample Frequency                                    |
|------------------------------------------------------------------|------------------------|------------------------------------------|-------------------------------------|-----------------------------------------------------|
| <b>Influent Samples</b>                                          |                        |                                          |                                     |                                                     |
| <b>Influent – Non-pathogenic pollutants</b>                      | Water                  | Downstream of Headworks                  | 24-hour Flow Proportional Composite | Minimum 5 samples per week                          |
| <b>Influent – Pathogen Measurements</b>                          | Water                  | Downstream of Headworks                  | Grab                                | As required by RWQB in accordance with NPDES permit |
| <b>Ocean Discharge Effluent Samples</b>                          |                        |                                          |                                     |                                                     |
| <b>Ocean Discharge Effluent – Non-pathogenic pollutants</b>      | Water                  | Ocean Outfall, NPDES Monitoring Location | 24-hour Flow Proportional Composite | Minimum 5 samples per week                          |
| <b>Ocean Discharge Effluent – Pathogen Measurement</b>           | Water                  | Ocean Outfall, NPDES Monitoring Location | Grab                                | As required by RWQB in accordance with NPDES permit |
| <b>Groundwater Recharge Effluent Samples</b>                     |                        |                                          |                                     |                                                     |
| <b>Groundwater Recharge Effluent – Non-pathogenic pollutants</b> | Water                  | CA RWQB Specified Monitoring Location    | 24-hour Flow Proportional Composite | Minimum 5 samples per week                          |

**Table 6 Sampling Locations, Sample Types and Sampling Frequency during 6-month Performance Testing Period**

| Sample Identification                                        | Sample Type/ Matrix | Sampling Location                                  | Sample Type                                                       | Sample Frequency                                                 |
|--------------------------------------------------------------|---------------------|----------------------------------------------------|-------------------------------------------------------------------|------------------------------------------------------------------|
| <b>Groundwater Recharge Effluent – Pathogen Measurements</b> | Water               | CA RWQB Specified Monitoring Location              | Grab                                                              | As required by RWQB in accordance with CCR Title 22 Requirements |
| <b>Thickened Sludge/Dewatering Process Feed Samples</b>      |                     |                                                    |                                                                   |                                                                  |
| <b>Thickened Solids</b>                                      | Sludge/Solids       | Downstream of Sludge Dewatering Process Feed Pumps | Composite of 4 grab samples taken over a minimum period of 10-min | Minimum 2 samples per shift                                      |
| <b>Dewatered Sludge Samples</b>                              |                     |                                                    |                                                                   |                                                                  |
| <b>Dewatered Solids</b>                                      | Sludge/Solids       | Sludge Cake Conveyer                               | Composite of 4 grab samples taken over a minimum period of 10-min | Minimum 2 samples per shift                                      |
| <b>Dewatering Filtrate Samples</b>                           |                     |                                                    |                                                                   |                                                                  |
| <b>Dewatered Filtrate</b>                                    | Water               | Dewatering Process – Filtrate Sampling Point       | Composite of 4 grab samples taken over a minimum period of 10-min | Minimum 2 samples per shift                                      |

**Section 5: Operating cost guarantees**

**Section 5.1: Introduction**

The power consumption of specified items of equipment and the consumption of specified chemicals will be guaranteed by FBV as set forth below. The guarantee for these parameters is provided as a single aggregated guarantee reflecting the aggregated cost of the power and chemicals consumed and will be measured during the verification period. Should the guaranteed parameters not be met during this time period, then FBV JV will pay liquidated damages as defined herein, and payment of such liquidated damages shall be City’s sole and exclusive remedy for FBV’s failure to meet such guarantees at any time. FBV JV shall have no liability for any variation from such guaranteed parameters which occurs after the verification period.

## Section 5.2: Power consumption

As required by the RFP, FBV guarantees the power consumption of the items of equipment listed in Table 7 which have nameplate powers in excess of 10 HP.

**Table 7 Equipment for which power consumption is guaranteed**

| Equipment                       |
|---------------------------------|
| MBR filtrate Pumps              |
| MBR Process Blowers             |
| MBR Scour Blowers               |
| RO Stage 1 feed Pumps           |
| UV Reactors                     |
| Sludge Storage Aeration Blowers |

Equipment over 10HP which forms part of the storm water flow treatment and membrane cleaning and flushing system and which only operate occasionally, either during wet weather events or during cleaning/flushing operations, are excluded from the power guarantee.

The power consumption for the above equipment (other than those excluded above) is guaranteed at 4730 KWH of electricity consumed per million gallons of influent entering the plant.

## Section 5.3: Chemicals consumption

The guaranteed chemical consumptions are given in Table 8

**Table 8 Chemicals consumption guaranteed**

| Chemical            | Form           | Point of application                                          | Guaranteed Value | Units               |
|---------------------|----------------|---------------------------------------------------------------|------------------|---------------------|
| Antiscalant         | As delivered   | RO feed                                                       | 26.4             | lb/MG plant inflow  |
| Sodium Bisulfite    | 38% solution   | Ocean Outfall                                                 | 0.55             | Gal/MG plant inflow |
| Sodium Hypochlorite | 12.5% solution | Ocean Outfall, RO Reject Water, RO feed, UVAOP, Product water | 108              | Gal/MG plant inflow |
| Sodium Hydroxide    | 25 % solution  | MBR, ROCIP, Product water                                     | 72               | Gal/MG plant inflow |
| Polyelectrolyte     | >50 % active   | Belt filter Press                                             | 7                | Gal/MG plant inflow |
| Calcite             | 100%           | Calcite filter                                                | 508              | lb/MG plant inflow  |

Chemicals not specifically stated in Table 8 are excluded from the chemical consumption guarantee. Citric acid which is used intermittently for the cleaning of the MBR and RO elements is specifically excluded from the guarantee.

## Section 5.4: Cost of electricity and chemicals

For the evaluation of the guarantees and the calculation of Liquidated Damages, the costs stipulated in Table 9 shall be used regardless of actual costs.

**Table 9 Stipulated power and chemical unit costs**

| Consumable          | Form           | Unit cost | Units |
|---------------------|----------------|-----------|-------|
| Power               | As metered     | \$0.12    | KWH   |
| Antiscalant         | As delivered   | \$2.15    | lb    |
| Sodium Bisulfite    | 38% solution   | \$4.20    | Gal   |
| Sodium Hypochlorite | 12.5% solution | \$1.25    | Gal   |
| Sodium Hydroxide    | 25 % solution  | \$1.71    | Gal   |
| Polyelectrolyte     | >50 % active   | \$21.65   | Gal   |
| Calcite             | 100%           | \$0.175   | lb    |

**Section 5.5 Evaluation of the consumable cost guarantee**

The consumable cost guarantee shall only apply to the power and chemicals used during the verification period and only to those elements previously specified.

The SCADA system will record the items listed in Table 10

Table 10 SCADA recorded parameters for guarantee evaluation

| Parameter                                      | Unit | Designation           |
|------------------------------------------------|------|-----------------------|
| Plant totalized inflow                         | MG   | Inflow                |
| MBR filtrate Pump totalized Power              | KWH  | MBR filtrate power    |
| MBR Process Blower totalized Power             | KWH  | MBR Process air Power |
| MBR Scour Blower totalized Power               | KWH  | MBR Scour air power   |
| RO Stage 1 feed Pump totalized Power           | KWH  | RO pump power         |
| UV Reactor totalized Power                     | KWH  | UV power              |
| Sludge Storage Aeration Blower totalized Power | KWH  | Sludge air power      |

At the start of the verification period initial values ( $_{initial}$ ) shall be recorded for:

- The parameters in Table 10
- The on-site inventory of chemicals in Table 8

During the verification test all deliveries to site ( $_{delivered}$ ) of the chemicals in table 8 shall be recorded including the volume of mass of the delivery as appropriate and the concentration of the delivered chemical.

At the end of the verification period initial values ( $_{final}$ ) shall be recorded for:

- The parameters in Table 10
- The on-site inventory of chemicals in Table 8

The plant inflow during the test is given by:

$$Inflow_{test} = Inflow_{final} - inflow_{initial} \tag{11}$$

The power consumed during the test is given by:

$$\begin{aligned}
 Power_{test} = & (MBR\ filtrate\ power_{final} - MBR\ filtrate\ power_{initial}) + (MBR\ process\ air\ power_{final} \\
 & - MBR\ process\ air\ power_{initial}) + (MBR\ scour\ air\ power_{final} - MBR\ scour\ air\ power_{initial}) \\
 & + (RO\ pump\ power_{final} - RO\ pump\ power_{initial}) + (UV\ power_{final} - UV\ power_{initial}) \\
 & + Sludge\ air\ power_{final} - sludge\ air
 \end{aligned} \tag{12}$$

The power consumed per MG during the test is given by:

$$unit\ power_{test} = \frac{Power_{test}}{Inflow_{test}} \tag{13}$$

The antiscalant use during the test is given by:

$$antiscalant_{test} = antiscalant_{final} + antiscalant_{delivery} - antiscalant_{initial} \tag{14}$$

The antiscalant consumed per MG during the test is given by:

$$unit\ antiscalant_{test} = \frac{antiscalant_{test}}{Inflow_{test}} \tag{15}$$

The Sodium Bisulphite use during the test is given by:

$$sodium\ bisulphite_{test} = sodium\ bisulphite_{final} + sodium\ bisulphite_{delivery} - sodium\ bisulphite_{initial} \tag{16}$$

The Sodium Bisulphite consumed per MG during the test is given by:

$$unit\ sodium\ bisulphite_{test} = \frac{sodium\ bisulphite_{test}}{Inflow_{test}} \tag{17}$$

The Sodium Hypochlorite use during the test is given by:

$$sodium\ hypochlorite_{test} = sodium\ hypochlorite_{final} + sodium\ hypochlorite_{delivery} - sodium\ hypochlorite_{initial} \tag{18}$$

The Sodium Hypochlorite consumed per MG during the test is given by:

$$unit\ sodium\ hypochlorite_{test} = \frac{sodium\ hypochlorite_{test}}{Inflow_{test}} \tag{19}$$

The Sodium Hydroxide use during the test is given by:

$$\text{sodium hydroxide}_{test} = \text{sodium hydroxide}_{final} + \text{sodium hydroxide}_{delivery} - \text{sodium hydroxide}_{initial} \quad (20)$$

The Sodium Hydroxide consumed per MG during the test is given by:

$$\text{unit sodium hydroxide}_{test} = \frac{\text{sodium hydroxide}_{test}}{\text{Inflow}_{test}} \quad (21)$$

The polyelectrolyte use during the test is given by:

$$\text{polyelectrolyte}_{test} = \text{polyelectrolyte}_{final} + \text{polyelectrolyte}_{delivery} - \text{polyelectrolyte}_{initial} \quad (22)$$

The polyelectrolyte consumed per MG during the test is given by:

$$\text{unit polyelectrolyte}_{test} = \frac{\text{polyelectrolyte}_{test}}{\text{Inflow}_{test}} \quad (23)$$

The Calcite use during the test is given by:

$$\text{calcite}_{test} = \text{calcite}_{final} + \text{calcite}_{delivery} - \text{calcite}_{initial} \quad (24)$$

The Calcite consumed per MG during the test is given by:

$$\text{unit calcite}_{test} = \frac{\text{calcite}_{test}}{\text{Inflow}_{test}} \quad (25)$$

**Section 5.6: Evaluation of liquidated damages for consumable costs**

The guaranteed power and chemical cost for the plant at the design annual average flow rate is \$398,391.22 as shown in Table 11 derived using the guaranteed values from table 8 , the stipulated unit costs from table 9 and an annual inflow of 354.09 MG (0.97 MGD x 365 days) .

**Table 11 guaranteed annual power and chemical cost**

| Consumable          | Guaranteed value | Units  | Unit cost | Units | Annual flow MG | Annual cost   |
|---------------------|------------------|--------|-----------|-------|----------------|---------------|
| Power               | 4730             | KWH/MG | \$0.12    | KWH   | 354.05         | \$ 200,958.78 |
| Antiscalant         | 26.4             | lb/MG  | \$2.15    | lb    | 354.05         | \$ 20,095.88  |
| Sodium Bisulfite    | 0.55             | Gal/MG | \$4.20    | Gal   | 354.05         | \$ 817.86     |
| Sodium Hypochlorite | 108              | Gal/MG | \$1.25    | Gal   | 354.05         | \$ 47,796.75  |
| Sodium Hydroxide    | 72               | Gal/MG | \$1.71    | Gal   | 354.05         | \$ 43,590.64  |
| Polyelectrolyte     | 7                | Gal/MG | \$21.65   | Gal   | 354.05         | \$ 53,656.28  |
| Calcite             | 508              | lb/MG  | \$0.175   | lb    | 354.05         | \$ 31,475.05  |
| Total cost          |                  |        |           |       |                | \$ 398,391.22 |

The actual annual power and chemical cost at design average throughput as measured during the verification period and using the stipulated unit costs from table 9 is

$$\begin{aligned}
 & \text{Power and Chemical annual cost}_{test} \\
 & = (\text{unit power}_{test} \times 0.12 + \text{unit antiscalant}_{test} \times 2.15 + \text{unit sodium bisulphite}_{test} \times 4.20 \\
 & + \text{unit sodium hypochlorite}_{test} \times 1.25 + \text{unit sodium hydroxide}_{test} \times 1.71 \\
 & + \text{unit polyelectrolyte}_{test} \times 21.65 + \text{unit calcite}_{test} \times 0.175) \times 354.05
 \end{aligned} \tag{26}$$

Provided the value calculated for *Power and Chemical annual cost<sub>test</sub>* is less than \$ 398,391.11 the power and chemicals consumables guarantees shall be met, the test passed, and no liquidated damages are payable nor shall any damages become payable should usage differ after the verification period.

If the value calculated for *Power and Chemical annual cost<sub>test</sub>* is greater than \$ 398,391.11 then the excess power and chemical cost shall be calculated.

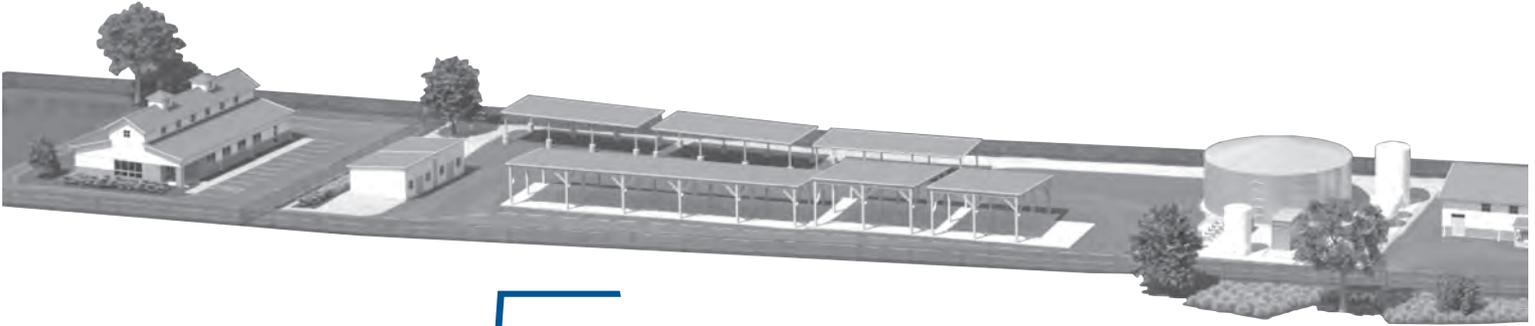

$$\text{Excess Power and Chemical annual cost}_{test} = \text{Power and Chemical annual cost}_{test} - 398391.11 \tag{27}$$

Liquidated damages shall be payable calculated on a Net Present Value basis assessed over a 10 year period with a 5% discount rate

This shall be calculated as:

$$\text{Liquidated Damage} = \text{Excess Power and Chemical annual cost}_{test} \times 7.7217 \tag{27}$$

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [MGD] | HP (rated) | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--------------------|------------|-----------------|------------|-----------------|--|--|--|
| Screen         | 2         | 8.14               | 2          | 2               | 95%        | 1.6             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Screen         | 2         | 1               | 0.67                | 2           | 2               | 95%        | 1.6             | 4              | 1               | 6          |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen always operating

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Screen         | 2         | 1               | 0.97                | 2           | 2               | 95%        | 1.6             | 4              | 333             | 2093       |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen always operating

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Screen         | 2         | 1               | 1.16                | 2           | 2               | 95%        | 1.6             | 4              | 30              | 188        |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen always operating

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Screen         | 2         | 1               | 2.75                | 2           | 2               | 95%        | 1.6             | 4.8            | 1               | 8          |

Notes: Assume operation at nameplate horsepower. Assume 6 min on, 24 min off (4.8 hours/d) with one screen always operating

|                      |             |

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [MGD] | HP (rated) | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--------------------|------------|-----------------|------------|-----------------|--|--|--|
| Grit Washer    | 1         | 8.14               | 3          | 3               | 95%        | 2.4             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 1         | 1               | 0.67                | 3           | 3               | 95%        | 2.4             | 4              | 1               | 9          |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen always operating

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 1         | 1               | 0.97                | 3           | 3               | 95%        | 2.4             | 4              | 333             | 3139       |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen always operating

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 1         | 1               | 1.16                | 3           | 3               | 95%        | 2.4             | 4              | 30              | 283        |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen always operating

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 1         | 1               | 2.75                | 3           | 3               | 95%        | 2.4             | 4.8            | 1               | 11         |

Notes: Assume operation at nameplate horsepower. Assume 6 min on, 24 min off (4.8 hours/d) with one screen always operating

|                      |             |
|----------------------|-------------|

## Electrical Load

### Design Condition

| Equipment Type | No. Units |  | Flow (rated) [gpm] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|--|--|--|
| Grit Pump      | 2         |  | 250                | 25               | 4.2        | 5               | 40%       | 95%        | N/A      | 3.1             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Grit Pump      | 2         | 1               | 250                 | 25                | 3.9         | 5               | 40%       | 94%        | -        | 3.1             | 4              | 1               | 13         |

Notes: Assume pump operates 4 minutes on, 20 minutes off (4 hr/d).

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Grit Pump      | 2         | 1               | 250                 | 25                | 3.9         | 5               | 40%       | 94%        | -        | 3.1             | 4              | 333             | 4182       |

Notes: Assume pump operates 4 minutes on, 20 minutes off (4 hr/d).

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Grit Pump      | 2         | 1               | 250                 | 25                | 3.9         | 5               | 40%       | 94%        | -        | 3.1             | 4              | 30              | 376        |

Notes: Assume pump operates 4 minutes on, 20 minutes off (4 hr/d).

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Grit Pump      | 2         | 1               | 250                 | 25                | 3.9         | 5               | 40%       | 94%        | -        | 3.1             | 4.8            | 1               | 15         |

Notes: Assume pump operates 4 minutes on, 20 minutes off (4 hr/d).

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [MGD] | HP (rated) | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--------------------|------------|-----------------|------------|-----------------|--|--|--|
| Fine Screen    | 2         | 1.88               | 2          | 2               | 95%        | 1.6             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Fine Screen    | 2         | 1               | 0.67                | 2           | 2               | 95%        | 1.6             | 4              | 1               | 6          |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen operating.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Fine Screen    | 2         | 1               | 0.97                | 2           | 2               | 95%        | 1.6             | 4              | 333             | 2093       |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen operating.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Fine Screen    | 2         | 1               | 1.16                | 2           | 2               | 95%        | 1.6             | 4              | 30              | 188        |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen operating.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Fine Screen    | 2         | 1               | 1.88                | 2           | 2               | 95%        | 1.6             | 4              | 1               | 6          |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one screen operating.

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [MGD] | HP (rated) | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--------------------|------------|-----------------|------------|-----------------|--|--|--|
| Grit Washer    | 2         | 1.88               | 2          | 2               | 95%        | 1.6             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 2         | 1               | 0.67                | 2           | 2               | 95%        | 1.6             | 4              | 1               | 6          |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one washer compactor operating

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 2         | 1               | 0.97                | 2           | 2               | 95%        | 1.6             | 4              | 333             | 2093       |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one washer compactor operating

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 2         | 1               | 1.16                | 2           | 2               | 95%        | 1.6             | 4              | 30              | 188        |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one washer compactor operating

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Grit Washer    | 2         | 1               | 2.75                | 2           | 2               | 95%        | 1.6             | 4              | 1               | 6          |

Notes: Assume operation at nameplate horsepower. Assume 5 min on, 25 min off (4 hours/d) with one washer compactor operating

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gpm] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|--|--|--|
| Pump           | 3         | 2300               | 2.5              | 6.3        | 7.5             | 40%       | 60%        | 96%      | 4.7             |  |  |  |

Notes: Electrical design assumes 5 HP motor, vendor selections are showing approximately 7.5 HP needed. Changed to 7.5 HP.

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 1               | 1637.8              | 2.5               | 2.6         | 7.5             | 40%       | 91%        | 96%      | 2.2             | 24             | 1               | 53         |

Notes: Ratio of RAS flow to plant flow is 3.52:1. Apply this ratio to 0.67 MGD to get 1967 gpm required for RAS pumps. Assume one pump operating at required flow.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 1185.6              | 2.5               | 1.9         | 7.5             | 40%       | 90%        | 96%      | 3.2             | 24             | 333             | 25802      |

Notes: Ratio of RAS flow to plant flow is 3.52:1. Apply this ratio to 0.97 MGD to get 2848 gpm required for RAS pumps. Assume two pumps operating at half of required flow.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 1417.8              | 2.5               | 2.2         | 7.5             | 40%       | 91%        | 96%      | 3.8             | 24             | 30              | 2756       |

Notes: Ratio of RAS flow to plant flow is 3.52:1. Apply this ratio to 11.6 MGD to get 3405 gpm required for RAS pumps. Assume two pumps operating at half of required flow.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 2300                | 2.5               | 3.6         | 7.5             | 40%       | 93%        | 96%      | 6.1             | 24             | 1               | 146        |

Notes: Capacity of MBR system is 1.88 MGD. Excess flow goes to SAFE system. Assume full design flow in this scenario, 2 pumps operating at 2300 gpm each.

|                      |       |
|----------------------|-------|
| <b>Total kWh/yr:</b> | 28757 |
|----------------------|-------|

## Electrical Load

### Design Condition

| Equipment Type | No. Units |  | Flow (rated) [gpm] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|--|--|--|
| Pump           | 2         |  | 40.0               | 35               | 1.2        | 1.5             | 50%       | 60%        | N/A      | 0.9             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 15.3                | 35                | 0.3         | 1.5             | 50%       | 89%        | -        | 0.2             | 24             | 1               | 5          |

Notes: Assumed to be same solids loading rate as scenario 2 and therefore same WAS flow rate.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 15.3                | 35                | 0.3         | 1.5             | 50%       | 89%        | -        | 0.2             | 24             | 333             | 1812       |

Notes: WAS flow rate based on solids loading rate. See document linked below for calculation.

[LCCA Energy - Side Calcs](#)

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 20.3                | 35                | 0.4         | 1.5             | 50%       | 90%        | -        | 0.3             | 24             | 30              | 214        |

Notes: Ratio of WAS-Q to Plant-Q is 0.030656:1. Apply this ratio to influent flow to get actual WAS flow in this scenario. Assume one pump duty with capacity of 40 gpm, operating continuously (24hrs/d).

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 29                  | 35                | 0.5         | 1.5             | 50%       | 91%        | -        | 0.4             | 24             | 1               | 10         |

Notes: Ratio of WAS-Q to Plant-Q is 0.030656:1. Apply this ratio to influent flow to get actual WAS flow in this scenario. Assume one pump duty with capacity of 40 gpm, operating continuously (24hrs/d).

|                      |      |
|----------------------|------|
| <b>Total kWh/yr:</b> | 2042 |
|----------------------|------|

## Electrical Load

### Design Condition

| Equipment Type | No. Units |  | Flow (rated) [gpm] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|--|--|--|
| Pump           | 3         |  | 700                | 45               | 11.8       | 15              | 74%       | 95%        | 96%      | 8.8             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 1               | 450                 | 45                | 6.9         | 15              | 74%       | 93%        | 96%      | 5.8             | 24             | 1               | 139        |

Notes: Filtrate flow equal to MBR influent flow minus WAS flow.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 329.2               | 45                | 5.1         | 15              | 74%       | 91%        | 96%      | 8.6             | 24             | 333             | 68782      |

Notes: Filtrate flow equal to MBR influent flow minus WAS flow.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 392.6               | 45                | 6.0         | 15              | 74%       | 92%        | 96%      | 10.2            | 24             | 30              | 7327       |

Notes: Filtrate flow equal to MBR influent flow minus WAS flow.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 638.3               | 45                | 9.8         | 15              | 74%       | 94%        | 96%      | 16.3            | 24             | 1               | 390        |

Notes: MBR capacity 1.88MGD, filtrate flow equal to 1.88MGD minus WAS flow.

|                      |       |

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Units Operating | Flow (rated) [scfm] | dP (rated) [psi] | HP (rated) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|-----------------|---------------------|------------------|------------|-----------------|-------------|------------|----------|-----------------|--|--|--|
| Blower         | 3         | 2               | 1050                | 10.6             | 77.2       | 75              | 69%         | 95%        | 96%      | 115.2           |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (actual) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|-------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 3         | 1               | 600                  | 9.7               | 36.8        | 75              | 69%         | 93%        | 96%      | 30.8            | 24             | 1               | 739        |

Notes: aeration rates based on process design, assuming continuous operation. For discharge pressure: sidewater depth above diffuser = 17ft (7.48psi), add 1.1 psi for diffuser headloss, add 0.9 for losses in pipes/valves, add 0.3 for inlet losses.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (actual) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|-------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 3         | 2               | 550                  | 9.7               | 33.8        | 75              | 69%         | 93%        | 96%      | 56.6            | 24             | 333             | 453034     |

Notes: aeration rates based on process design, assuming continuous operation. For discharge pressure: sidewater depth above diffuser = 17ft (7.48psi), add 1.1 psi for diffuser headloss, add 0.9 for losses in pipes/valves, add 0.3 for inlet losses.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (actual) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|-------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 3         | 2               | 800                  | 9.7               | 49.1        | 75              | 69%         | 94%        | 96%      | 81.3            | 24             | 30              | 58567      |

Notes: aeration rates based on process design, assuming continuous operation. For discharge pressure: sidewater depth above diffuser = 17ft (7.48psi), add 1.1 psi for diffuser headloss, add 0.9 for losses in pipes/valves, add 0.3 for inlet losses.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (actual) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|-------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 3         | 2               | 1050                 | 9.7               | 64.5        | 75              | 69%         | 94%        | 96%      | 106.9           | 24             | 1               | 2565       |

Notes: aeration rates based on process design, assuming continuous operation. For discharge pressure: sidewater depth above diffuser = 17ft (7.48psi), add 1.1 psi for diffuser headloss, add 0.9 for losses in pipes/valves, add 0.3 for inlet losses.

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Units Operating | Flow (rated) [scfm] | dP (rated) [psi] | HP (rated) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|-----------------|---------------------|------------------|------------|-----------------|-------------|------------|----------|-----------------|--|--|--|
| Blower         | 4         | 3               | 270                 | 6                | 11.8       | 10              | 66%         | 95%        | 96%      | 26.3            |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (rated) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 4         | 2               | 210.5                | 6                | 8.4         | 10              | 66%         | 94%        | 96%      | 13.8            | 8.4            | 1               | 116        |

Notes: Assume scour blowers operate 35% of the time in all active trains.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (rated) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 4         | 2               | 210.5                | 6                | 8.4         | 10              | 66%         | 94%        | 96%      | 13.8            | 8.4            | 333             | 38748      |

Notes: Assume scour blowers operate 35% of the time in all active trains.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (rated) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 4         | 3               | 270                  | 6                | 10.7        | 10              | 66%         | 92%        | 96%      | 27.1            | 8.4            | 30              | 6821       |

Notes: Assume scour blowers operate 35% of the time in all active trains.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [scfm] | dP (rated) [psi] | HP (actual) | HP (name plate) | Blower Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|----------------------|------------------|-------------|-----------------|-------------|------------|----------|-----------------|----------------|-----------------|------------|
| Blower         | 4         | 3               | 270                  | 6                | 10.7        | 10              | 66%         | 92%        | 96%      | 27.1            | 8.4            | 1               | 227        |

Notes: Assume scour blowers operate 35% of the time in all active trains.

## Electrical Load

### Design Condition

| Equipment Type | No. Units |  | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--|-----------------|------------|-----------------|--|--|--|
| Compressor     | 1         |  | 2.5             | 95%        | 2.0             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Compressor     | 1         | 1               | 2.5             | 95%        | 2.0             | 2              | 1               | 5          |

Notes: Assume compressor runs 10% of the time in all scenarios.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Compressor     | 1         | 1               | 2.5             | 95%        | 2.0             | 2              | 333             | 1570       |

Notes: Assume compressor runs 10% of the time in all scenarios.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Compressor     | 1         | 1               | 2.5             | 95%        | 2.0             | 2              | 30              | 141        |

Notes: Assume compressor runs 10% of the time in all scenarios.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Compressor     | 1         | 1               | 2.5             | 95%        | 2.0             | 2              | 1               | 5          |

Notes: Assume compressor runs 10% of the time in all scenarios.

## Electrical Load

### Design Condition

| Equipment Type | No. Units | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|-----------------|------------|-----------------|--|--|--|
| Refrigerator   | 1         | 1               | 95%        | 0.8             |  |  |  |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Refrigerator   | 1         | 1               | 1               | 95%        | 0.8             | 2              | 1               | 2          |

Notes: Assume compressor runs 10% of the time in all scenarios. Unit runs whenever compressor runs.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Refrigerator   | 1         | 1               | 1               | 95%        | 0.8             | 2              | 333             | 628        |

Notes: Assume compressor runs 10% of the time in all scenarios. Unit runs whenever compressor runs.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Refrigerator   | 1         | 1               | 1               | 95%        | 0.8             | 2              | 30              | 57         |

Notes: Assume compressor runs 10% of the time in all scenarios. Unit runs whenever compressor runs.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Refrigerator   | 1         | 1               | 1               | 95%        | 0.8             | 2              | 1               | 2          |

Notes: Assume compressor runs 10% of the time in all scenarios. Unit runs whenever compressor runs.

|                      |     |

## Electrical Load

### Design Condition

| Equipment Type | No. Units | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|-----------------|------------|-----------------|--|--|--|
| Mixer          | 1         | 60              | 95%        | 47.1            |  |  |  |

Notes:

### Operating Scenario

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Mixer          | 1         | 1               | 60              | 95%        | 47.1            | 3              | 6               | 848        |

Notes: Assumes 45kW heater to raise 1800 gal water in tank from 75 deg F to 105 deg F. For each pound of water, 1 BTU is required per degree F. 1800 gal x 8.31 lb/gal x 30 deg F = 448,740 BTU required for heating. For each kW electric resistive heat 3412 btu/hr supplied. Therefore one heating cycle takes ~3 hours. Assume 2 CIPs per year in each train.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Mixer          | 1         |                 | 60              | 95%        | -               |                | 333             | 0          |

Notes:

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Mixer          | 1         |                 | 60              | 95%        | -               |                | 30              | 0          |

Notes:

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Mixer          | 1         |                 | 60              | 95%        | -               |                | 1               | 0          |

Notes:

|                      |     |
|----------------------|-----|
| <b>Total kWh/yr:</b> | 848 |

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gpm] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 2         | 210                | 140              | 10.0       | 15              | 78%       | 95%        | N/A      | 7.5             |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 210                 | 140               | 9.5         | 15              | 78%       | 94%        | -        | 7.6             | 0.25           | 1               | 2          |

Notes: Assume one flush for turndown from 3 trains to 2. Assume flush cycle to be 15 minutes.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 210                 | 140               | 9.5         | 15              | 78%       | 94%        | -        | 7.6             | 0.5            | 333             | 1263       |

Notes: Assume 2 flushes per day for rotation of trains. Assume each flush cycle to be 15 minutes.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 210                 | 140               | 9.5         | 15              | 78%       | 94%        | -        | 7.6             | 0.5            | 30              | 114        |

Notes: Assume 2 flushes per day for rotation of trains. Assume each flush cycle to be 15 minutes.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 210                 | 140               | 9.5         | 15              | 78%       | 94%        | -        | 7.6             | 0.5            | 1               | 4          |

Notes: Assume 2 flushes per day for rotation of trains. Assume each flush cycle to be 15 minutes.

|                      |      |
|----------------------|------|
| <b>Total kWh/yr:</b> | 1382 |
|----------------------|------|

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [MGD] | HP (rated) | HP (name plate) | Motor Eff. | Power draw [kW] |  |  |  |
|----------------|-----------|--------------------|------------|-----------------|------------|-----------------|--|--|--|
| Mixer          | 1         |                    | 1          | 1               | 95%        | 0.8             |  |  |  |

Notes: Assuming 1 HP, no data provided.

### Operating Scenario

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Mixer          | 1         | 1               |                     | 1           | 1               | 95%        | 0.8             | 1              | 6               | 5          |

Notes: Assume mixer runs for 1 hour during each CIP cycle. Assume 2 CIP cycles per year for each train.

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [MGD] | Motor Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------|-----------------|
| Lamp           | 2         | 0.93               | N/A        | 16.5            |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | Flow Ratio | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|------------|------------|-----------------|----------------|-----------------|------------|
| Lamp           | 2         | 1               | 0.54                | 0.58       | N/A        | 9.5             | 24             | 1               | 228        |

Notes: Preliminary power usage data provided suggests power usage for UV lamps between 14.4 and 18.5 kW at design flow (0.93mgd). The average of that range has been used in all flow scenarios as an estimation of the required power for the lamps. UV power usage is proportionalized to % of vessel capacity to approximate usage.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | Flow Ratio | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|------------|------------|-----------------|----------------|-----------------|------------|
| Lamp           | 2         | 1               | 0.78                | 0.83       | N/A        | 13.7            | 24             | 333             | 109781     |

Notes: Preliminary power usage data provided suggests power usage for UV lamps between 14.4 and 18.5 kW at design flow (0.93mgd). The average of that range has been used in all flow scenarios as an estimation of the required power for the lamps. UV power usage is proportionalized to % of vessel capacity to approximate usage.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | Flow Ratio | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|------------|------------|-----------------|----------------|-----------------|------------|
| Lamp           | 2         | 1               | 0.93                | 1          | N/A        | 16.5            | 24             | 30              | 11844      |

Notes: Preliminary power usage data provided suggests power usage for UV lamps between 14.4 and 18.5 kW at design flow (0.93mgd). The average of that range has been used in all flow scenarios as an estimation of the required power for the lamps. UV power usage is proportionalized to % of vessel capacity to approximate usage.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | Flow Ratio | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|------------|------------|-----------------|----------------|-----------------|------------|
| Lamp           | 2         | 1               | 0.93                | 1          | N/A        | 16.5            | 24             | 1               | 395        |

Notes: Preliminary power usage data provided suggests power usage for UV lamps between 14.4 and 18.5 kW at design flow (0.93mgd). The average of that range has been used in all flow scenarios as an estimation of the required power for the lamps. UV power usage is proportionalized to % of vessel capacity to approximate usage.

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gpm] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 3         | 323                | 63               | 7.1        | 7.5             | 80%       | 95%        | 96%      | 5.3             |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 206.4               | 50.32             | 3.3         | 7.5             | 80%       | 92%        | 96%      | 5.5             | 24             | 1               | 132        |

Notes: Assume all flow from UV treatment goes to IPR less the flow to on-site pumps (assumed to 37.5 gpm at all times).

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 2               | 306.5               | 51.73             | 5.0         | 7.5             | 80%       | 94%        | 96%      | 8.3             | 24             | 333             | 66344      |

Notes: Assume all flow from UV treatment goes to IPR less the flow to on-site pumps (assumed to 37.5 gpm at all times).

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 3               | 246                 | 50.78             | 3.9         | 7.5             | 80%       | 93%        | 96%      | 9.9             | 24             | 30              | 7106       |

Notes: Assume all flow from UV treatment goes to IPR less the flow to on-site pumps (assumed to 37.5 gpm at all times).

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 3         | 3               | 246                 | 50.78             | 3.9         | 7.5             | 80%       | 93%        | 96%      | 9.9             | 24             | 1               | 237        |

Notes: Assume all flow from UV treatment goes to IPR less the flow to on-site pumps (assumed to 37.5 gpm at all times).

|                      |       |

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gpm] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 2         | 75                 | 175              | 6.1        | 7.5             | 60%       | 95%        | 96%      | 4.5             |

Notes: 5 HP was assumed in design, may need to be 7.5 HP based on vendor efficiencies.

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 37.5                | 175               | 2.8         | 7.5             | 60%       | 92%        | 96%      | 2.3             | 24             | 1               | 56         |

Notes: Assume one pump operating at half rated flow in all scenarios (24/7).

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 37.5                | 175               | 2.8         | 7.5             | 60%       | 92%        | 96%      | 2.3             | 24             | 333             | 18716      |

Notes: Assume one pump operating at half rated flow in all scenarios (24/7).

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 37.5                | 175               | 2.8         | 7.5             | 60%       | 92%        | 96%      | 2.3             | 24             | 30              | 1685       |

Notes: Assume one pump operating at half rated flow in all scenarios (24/7).

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [gpm] | TDH (actual) [ft] | HP (actual) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------------|-------------|-----------------|-----------|------------|----------|-----------------|----------------|-----------------|------------|
| Pump           | 2         | 1               | 37.5                | 175               | 2.8         | 7.5             | 60%       | 92%        | 96%      | 2.3             | 24             | 1               | 56         |

Notes: Assume one pump operating at half rated flow in all scenarios (24/7).

|                      |       |
|----------------------|-------|
| <b>Total kWh/yr:</b> | 20514 |
|----------------------|-------|

### Operations and Maintenance

## Electrical Load

### Design Condition

| Equipment Type | No. Units | Flow (rated) [MGD] | HP (rated) | HP (name plate) | Motor Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------|-----------------|------------|-----------------|
| Disc Filter    | 1         | 6.26               | 1          | 1               | 95%        | 0.8             |

Notes:

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Disc Filter    | 1         | 0               | 0                   | 1           | 1               | 95%        | 0.8             | 0              | 1               | 0          |

Notes: SAFE system only operates when plant influent flow exceeds 1.88 MGD.

### Scenario 2, Avg Day (0.97 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Disc Filter    | 1         | 0               | 0                   | 1           | 1               | 95%        | 0.8             | 0              | 333             | 0          |

Notes: SAFE system only operates when plant influent flow exceeds 1.88 MGD.

### Scenario 3, Max Month (1.16 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Disc Filter    | 1         | 0               | 0                   | 1           | 1               | 95%        | 0.8             | 0              | 30              | 0          |

Notes: SAFE system only operates when plant influent flow exceeds 1.88 MGD.

### Scenario 4, Max Day (2.75 MGD)

| Equipment Type | No. Units | Units Operating | Flow (actual) [MGD] | HP (actual) | HP (name plate) | Motor Eff. | Power draw [kW] | Op Time [hr/d] | Op Freq. [d/yr] | Annual kWh |
|----------------|-----------|-----------------|---------------------|-------------|-----------------|------------|-----------------|----------------|-----------------|------------|
| Disc Filter    | 1         | 1               | 0.87                | 1           | 1               | 95%        | 0.8             | 24             | 1               | 19         |

Notes: SAFE system treats any flow in excess of 1.88 MGD.

| Pump           | 1         | 50                 | 403              | 0.6        | 0.5             | 15%       | 95%        | 96%      | 0.5             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

### Scenario 1, Min Day (0.67 MGD)

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 95               | 0.1        | 0.5             | 15%       | 95%        | 96%      | 0.1             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

### Scenario 1, Min Day (0.67 MGD)

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 70               | 0.1        | 0.5             | 30%       | 95%        | 96%      | 0.0             |

Notes: Pump flow is based on chemical usage. The maintenance clean is based on 0.025 lb sodium-hypochlorite/module. A maintenance clean is performed every 10 days. A maintenance clean runs 30 minutes per train.

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 95               | 0.1        | 0.5             | 15%       | 95%        | 96%      | 0.1             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 373              | 0.6        | 0.5             | 15%       | 95%        | 96%      | 0.4             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 403              | 0.6        | 0.5             | 15%       | 95%        | 96%      | 0.5             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 70               | 0.1        | 0.5             | 15%       | 95%        | 96%      | 0.1             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 70               | 0.1        | 0.5             | 15%       | 95%        | 96%      | 0.1             |

Notes: External alkalinity needs are based on 3 factors: 1) the influent ammonia concentration, 2) the influent alkalinity concentration, and 3) the target alkalinity in the MBR filtrate. We anticipate there is adequate alkalinity in the influent wastewater under Min. Day, Average Day, and Max. Day conditions. However, under Maximum Month conditions when ammonia concentrations are greatest, we anticipate there will be insufficient alkalinity in the influent to meet the target concentration in the MBR filtrate, and supplementary alkalinity will be required.

### Scenario 1, Min Day (0.67 MGD)

| Equipment Type   | No. Units | Units Operating | Flow (actual) [gph]       | TDH (actual) [ft] | HP (actual)        | HP (name plate) | Pump Eff.                   | Motor Eff. | VFD Eff. | Power draw [kW]  | Op Time [hr/d]    | Op Freq. [d/yr] | Annual kWh |
|------------------|-----------|-----------------|---------------------------|-------------------|--------------------|-----------------|-----------------------------|------------|----------|------------------|-------------------|-----------------|------------|
| Pump             | 1         | 0               | 0.00                      | 95                | 0.0000             | 0.5             | 15%                         | 86%        | 96%      | 0.0              | 24                | 1               | 0          |

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 70               | 0.1        | 0.5             | 15%       | 95%        | 96%      | 0.1             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| Pump           | 1         | 50                 | 70               | 0.1        | 0.5             | 15%       | 95%        | 96%      | 0.1             |

Notes: Pump flow is based on chemical usage. The process flow is flow of wastewater where the chemical is being injected or fed.

Notes: Pump flow is based on chemical usage. The recovery clean is based on 1.8 lb of citric acid/module. A recovery clean is performed 2 times per year. A recovery clean doses citric for approx 60 minutes per train.

## Electrical Load & Chemical Cost

### Design Condition

| Equipment Type | No. Units | Flow (rated) [gph] | TDH (rated) [ft] | HP (rated) | HP (name plate) | Pump Eff. | Motor Eff. | VFD Eff. | Power draw [kW] |
|----------------|-----------|--------------------|------------------|------------|-----------------|-----------|------------|----------|-----------------|
| BW Pump        | 2         | 27,120             | 56               | 9.0        | 30              | 78%       | 95%        | 96%      | 6.7             |

Notes: Electrical usage listed is for backwash pump for contactor. Pump flow is based on backwash flow from the contactor. Assume backwashing 20 minutes every month.

## Electrical Load

### Design Condition

| Equipment Type      | No. Units |  |  |  |  |  |  |  |  |
|---------------------|-----------|--|--|--|--|--|--|--|--|
| Emergency Generator | 1         |  |  |  |  |  |  |  |  |

Notes: The emergency generator only draws power when the main power is offline. The emergency generator power is accounted for in the power requirements for all other equipment at the facility.

## Section 2. Current Critical Work Effort – Cost Reduction/Rate Impact Mitigation

The City recognizes the financial magnitude of the WRF program and impact on the community. As a result, City staff has focused their efforts on increasing the program's affordability and reducing those financial impacts on its ratepayers through the following actions:

- Selecting the preferred proposer for completion of the WRF onsite improvements that represents the best value for the City;
- Evaluating alternatives for configuration of the WRF Facilities Building;
- Providing insight into the previous water and sewer rate increases that began in 2015;
- Making modifications to the City's existing Utility Discount Program;
- Establishing a City Rate Review Process; and
- Pursuing state and federal funding, in the form of low-interest loans and grants

### *Section 2.A Procurement Process for the WRF Onsite Improvements*

After receiving the proposals, City staff and the program management team met with members of the WRFCAC WRF Subcommittee to provide the technical content of the proposals and kick-off the review process. The proposals were initially reviewed by that subcommittee, City staff, and program management team for compliance with the RFP and technical accuracy.

Based on the review of the two proposals, both DB teams were invited to participate in 1.5-hour interviews held at the Fire Station Training Room on June 1, 2018. Following the interviews, the members of the evaluation team met as a group to discuss the proposal review and interviews, and evaluate each against the selection criteria and weights established in the RFP (below).

| Criterion                                  | Possible Score |
|--------------------------------------------|----------------|
| <b>Technical Proposal</b>                  |                |
| Management Proposal                        | 3              |
| Quality Assurance and Quality Control      | 3              |
| Schedule and Cost Control                  | 4              |
| Team/City Collaboration and Integration    | 3              |
| Design Development and Management          | 3              |
| Project Sequencing and Scheduling          | 4              |
| Proposed Design and Performance Guarantees | 20             |
| <b>Price Proposal and Life-Cycle Cost</b>  | 60             |
| <b>Total</b>                               | <b>100</b>     |

The results of the evaluation are presented in the table below. The DB proposal with the lowest life-cycle cost was awarded the maximum score of 60. The score given to the DB with the higher cost is based on the relative difference between the life-cycle costs for each proposal (*i.e.*, the number of points awarded was 5% lower than the maximum since the life-cycle cost was 5% higher). The rationale for each of the scores assigned for all technical categories, along with the actual scores, is presented in the table below:

| Filanc/Black & Veatch                                                                                                                                                                                                                                                                                                                                |           | AECOM/W.M. | <b>Total</b>                                                                                                                                                                                                                                                                              |  |           |                                                                                                                                                                                                                                                  |
| <b>93</b>                                                                                                                                                                                                                                                                                 |  | <b>79</b> |                                                                                                                                                                                                                                                  |

The construction cost in the Filanc/Black & Veatch proposal for the WRF onsite improvements is approximately \$20 Million less than the estimate presented to Council for this portion of the program in September 2017.

Recommendation for Council Regarding Preferred Proposer

Staff recommends the Council select Filanc/Black & Veatch as the preferred proposer and direct staff to enter into negotiations with the goal of returning with a contract for Council approval after certification of the Final EIR and successful completion of the Proposition 218 process.

*Section 2.B 2015 Rate Increase Background*

With the adoption of the 2015 rate increases, one of the expectations was for those rate increases to generate additional revenue to fund existing capital and infrastructure needs, as well as generate funds to support the WRF program. During that time, the state of California experienced the most severe drought in State history. Concurrently, the City chose to defer most capital and infrastructure needs pending a comprehensive review of needs, development of a plan and progression on the WRF program. The drought, coupled with the conservative deferral of capital expenditures, has affected the accumulation of monies in the water and sewer accumulation funds.

Since the 2015 rate increase went into effect, the City has accumulated an additional \$2.8 Million of available cash between the sewer and water funds to assist with funding of the WRF project. Funding of the preliminary phases of the WRF project under a pay-as-you-go approach helps reduce debt and overall principal and interest owed by the City, thereby reducing overall project costs.

Included in Attachment 1 is a summary of the Water and Sewer Rate increases, revenue increases since the rate increases went into effect, and overall increases to the accumulation of available cash (FY 2014/15 through FY 2016/17). Staff will continue to update that information with FY 2017/18 figures, once the current fiscal year is closed-out in late fall of 2018. Staff is currently projecting the FY 2018/19 proposed WRF budget of \$9.4 Million will be fully funded with available cash within the water and sewer funds, thereby further delaying drawdown of the State Revolving Loan Fund (SRF) planning loan.

The 2015 rate study was based on some key financial assumptions, including funding a new

\$75 Million WRF with the Cayucos Sanitary District (CSD) funding 25 percent to 30 percent of that new facility. The following is taken directly from the 2015 Proposition 218 Notice:

“The proposed rates assume the City can obtain low-interest-rate financing from the Clean Water State Revolving Fund Financing Program to fund the planned new \$75 Million Water Reclamation Facility. If the facility ends up costing significantly more than estimated or state-subsidized financing is not available, then the City may need to re-evaluate rate increases in future years.”

Since the adoption of those rates, two key assumptions have changed:

1. The City no longer expects 25 percent to 30 percent cost sharing with the CSD
2. The City now has more refined cost estimates for the various components of the WRF program.

Given those significant changes in assumptions, as identified in the previous Proposition 218 notice, the BRC and the City are now reevaluating rates that would be needed to support the cost of the new facility.

#### Section 2.C WRF Facility Building Evaluation

City Council requested a review of the proposed operations and maintenance buildings for the WRF, and staff engaged the assistance of RRM Design Group to conduct an evaluation of options. According to that study, the City could realize savings in the overall cost of the WRF program by continuing to use the existing WWTP buildings as shown in Attachment 2 to house a portion of the water and wastewater operations staff, with the remainder housed at the WRF.

While the existing WWTP operations building reuse makes up about half of the total operations buildings at the proposed WRF site, some of the functions of the operations building will need to be shifted to the WRF maintenance building for split operations and it will need to grow by about 20 percent over what is currently proposed. This reuse of existing remodeled facilities and minimal facilities on the WRF site results in a net cost savings of between 8 to 18 percent for reusing existing facilities on the existing WWTP site and corporation yard. Therefore, the total net savings in initial cost would be somewhere in the range of \$640,000 to \$1.4 Million (option 2 below).

An additional alternative (option 3) would be to construct minimal facilities at the WRF and continue to use the existing facilities “as-is” with a plan for future upgrades as additional funds are available. This could achieve between 25 and 50 percent savings in building costs at the new WRF site thus saving between \$2 - \$4 Million. However, this will require future work at the existing site to bring those facilities up to meeting the needs of staff.

While those savings are measurable for option 2 and 3, as a percentage of the total WRF program, the magnitude of the savings do not out-weigh potential negative impacts on operation of the utilities division and to the existing wastewater treatment plant site. Specifically, splitting of the utilities division between the WRF and existing WWTP site would result in a loss of operational efficiencies by not having all staff collocated. With the new WRF and its potable reuse components, it will require staff with certification in water treatment and distribution to operate those portions of the facility. With the lean makeup of utility staffing, splitting the staffing into two operations centers could cause loss of productivity. Furthermore, by retaining structures at the existing site, as would be necessitated by maintaining a portion

## **EXHIBIT VI. ALTERNATIVES ANALYSIS**

A Project Alternatives analysis was presented in the letter of interest and is included in the Water Reclamation Plan. The Alternatives Analysis section of the Water Reclamation Plan is attached as **Exhibit VI**.

**SECTION 7 PROJECT ALTERNATIVE ANALYSIS**

Based on the market assessment and hydrogeological screenings, the project alternatives that appear feasible and are further analyzed herein are summarized in **Table 7-1**.

**Table 7-1: Summary of Project Alternatives**

| Alternative # | Title                                                                                                                                                 | Brief Description                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0             | No Recycled Water Project (Discharge to existing ocean outfall)                                                                                       | With no recycled water project, the City would continue discharging treated effluent to the existing ocean outfall.                                                                                                                                                                                             |
| 1             | Urban Reuse                                                                                                                                           | Recycled water pipeline from WRF to City with turnouts to various urban commercial and landscape irrigation users for potential potable water offset, and recycled water to Morro Bay Golf Course.                                                                                                              |
| 2             | Delivery of recycled water to agricultural users in exchange for pumped groundwater delivered to the City – “Agricultural Exchange”                   | Recycled water pipeline to properties in the Morro Valley along Hwy 41 to deliver recycled water for agricultural irrigation in exchange for groundwater sent back to the City. Alternative would include potable water pipeline from upper Morro Valley to City.                                               |
| 3             | Indirect potable reuse: Groundwater replenishment using subsurface application at the Narrows (injection wells) – “Indirect Potable Reuse – East”     | Recycled water pipeline to new groundwater injection wells east of Hwy 1 and south of Hwy 41, near the Narrows, for groundwater replenishment. Groundwater extracted from existing City wells in the Morro Valley would be treated at the City’s existing water treatment plant.                                |
| 4             | Indirect potable reuse: Groundwater replenishment using subsurface application near the bike path (injection wells) – “Indirect Potable Reuse – West” | Recycled water pipeline to new groundwater injection wells west of Hwy 1 and south of Hwy 41, near the bike path adjacent to Lila Keiser Park, for groundwater replenishment. Groundwater extracted from existing City wells in the Morro Valley would be treated at the City’s existing water treatment plant. |

**7.1 Evaluation Criteria**

In order to evaluate the various recycled water alternatives, evaluation criteria were defined based on the WRF Project Community Goals adopted by City Council. The WRF project community goals and applicability comments from **Section 1** are included again in **Table 7-2** for reference. These project goals were the focus for the Draft FMP and were used to evaluate technologies and processes for the WRF. It should be noted that any recycled water project would be required to submit a Title 22 Report to the RWQCB and SWRCB DDW for review and approval and obtain agreements and contracts with recycled water users prior to project implementation.

| Table 7-2: WRF Project Community Goals                      |                                                                                                                                                                 |                                                                                                                              |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Community Goal                                              | Applicability for WRF                                                                                                                                           | Applicability for Recycled Water                                                                                             |
| Produce tertiary disinfected recycled water                 | WRF project is to be designed accordingly                                                                                                                       | Allows for multitude of recycled water uses and provides basis for advanced treatment                                        |
| Produce reclaimed wastewater cost-effectively               | Draft FMP considered costs in treatment evaluation                                                                                                              | Project alternative assessment will include capital and operating costs and consider total amount of recycled water produced |
| Allow for onsite composting                                 | Reviewed as part of Draft FMP. Onsite composting is not recommended, regional facility composting will be more cost effective and more compatible for neighbors | Not Applicable                                                                                                               |
| Design for energy recovery                                  | Draft FMP considered energy recovery for WRF                                                                                                                    | Project alternatives analysis will consider energy usage                                                                     |
| Design to treat for contaminants of emerging concern (CECs) | Draft FMP included consideration in treatment evaluation                                                                                                        | Advanced treatment would provide additional treatment for CECs                                                               |
| Allow for other municipal uses                              | Draft FMP considered for WRF site planning                                                                                                                      | Not Applicable                                                                                                               |
| Ensure compatibility with neighboring land uses             | Draft FMP considered for WRF site planning                                                                                                                      | Consideration for major infrastructure siting                                                                                |
| Operational WRF within five years                           | WRF project is on schedule                                                                                                                                      | Project alternatives analysis will consider potential challenges that could delay the project.                               |

The recycled water project alternatives were evaluated based on the following criteria, aligning with the community project goals:

- Comparative capital and operating costs
- Compatibility with neighboring land uses and impact during construction
  - o Total pipeline length
  - o Land acquisition
- Reliability of recycled water uses and potential for schedule delays
- Potential to benefit the City’s potable water supply (as described below)

This evaluation also considers the potential to benefit the City’s potable water supply, either by offsetting potable water demand through delivery and use of recycled water or by a more direct method of supplementing the City’s groundwater supply using injection wells (indirect potable reuse). The City currently relies on imported water from the SWP as the primary source of water. During times of low deliveries, or when the annual SWP maintenance occurs, the City utilizes brackish groundwater from the Morro Valley Groundwater Basin, treated through the BWRO at the Water Treatment Plant. Currently, only groundwater from the City’s Morro Valley wells can be treated at the BWRO facility, and there is no treatment available for the Chorro Valley wells, which have also been high in nitrates and TDS. Reducing dependence on imported water by offsetting demand or supplementing with recycled water would increase reliability of the City’s water supply and could reduce long-term costs. The SWP consists of a complex network of reservoirs, aqueducts, powerplants and pumping plants. Increasing the City’s local supply of water

provides additional resiliency and reduces the risk of interruption of an imported water supply due to damage caused by earthquakes, climate change, or some other natural disaster. The costs of SWP are anticipated to rise with required improvements as facilities age and critical projects are identified. The City may be able to maintain their SWP allocation, and arrange contracts to transfer their allocation of water to other SWP customers.

**7.2 Planning and Design Assumptions**

City records and various reports were used to develop the basis for design assumptions for the recycled water project alternatives. Section 2 and Section 3 detail the historical water produced and imported as well as the metered usage. Conservation efforts mandated by the State of California have resulted in a substantial reduction in demand in recent years. The City’s main source of water is the SWP which has become increasingly unreliable in recent years due to drought conditions.

Preliminary design criteria for the WRF from the Draft FMP were used to develop planning and design assumptions in the comparison of the recycled water alternatives. The City identified one of the main goals of the WRF project is to produce disinfected tertiary recycled water. To best achieve this level of treatment using industry standard technologies, the Draft FMP identified two liquid treatment alternatives, with potential for future expansion to advanced treatment. One alternative was a conventional treatment option consisting of screening, grit removal, flow equalization, secondary treatment with sequencing batch reactor, tertiary treatment achieved through microfiltration, and disinfection by ultraviolet radiation. The other alternative, a combined secondary and tertiary treatment option, involved screening, grit removal, flow equalization, secondary and tertiary treatment through a membrane bioreactor process, and disinfection by ultraviolet radiation. The membrane bioreactor acts as both a biological treatment process and a filtration process. A brief discussion and process flow diagrams for the treatment alternatives is provided in Section 4.3.

Advanced treatment will likely be required for the recycled water projects under consideration, and will be discussed in a later section. Both treatment systems would provide adequate biological treatment for reverse osmosis, but the conventional treatment option would require addition of membrane filters as a pretreatment step to reverse osmosis. The ultraviolet disinfection process can also be coupled with hydrogen peroxide treatment to provide an advanced oxidation process (AOP).

WRF influent flows and anticipated recoveries of the treatment technologies outlined in the Draft FMP used to develop the preliminary design criteria for recycled water pipelines, storage, and advanced treatment facilities for each alternative are listed in Table 7-3.

| <b>Table 7-3: Anticipated Recoveries and WRF Influent Flow Rate</b>                  |                     |
|--------------------------------------------------------------------------------------|---------------------|
| Average Annual Flow – WRF Influent at Buildout                                       | 0.97 MGD / 1087 AFY |
| Microfiltration Recovery                                                             | 95%                 |
| Membrane Bioreactor Recovery                                                         | 95%                 |
| Reverse Osmosis Recovery                                                             | 80%                 |
| Reverse Osmosis salt rejection                                                       | 98%                 |
| Estimated Future Annual Production from WRF at Buildout                              | 825 – 1087 AFY      |

Table 7-4 summarizes the preliminary design criteria used for sizing the recycled water pipelines and pump stations for the various alternatives.

| Table 7-4: Preliminary Hydraulic Design Criteria |          |
|--------------------------------------------------|----------|
| Parameter                                        | Criteria |
| Minimum Service Pressure for Spray Irrigation    | 45 PSI   |
| Minimum Service Pressure for Drip Irrigation     | 15 PSI   |
| ADD Pipeline Velocity                            | < 5 fps  |
| PHD Pipeline Velocity                            | < 10 fps |
| Hazen-Williams Roughness Coefficient             | 130      |

### 7.3 Project Alternative 0: No Recycled Water Project

Project Alternative 0: No Recycled Water Project would consist of constructing a new WRF and either deferring or removing the recycled water component from the overall project. A treated effluent discharge pipeline would be constructed from the WRF to the existing ocean outfall. This line would be installed with any of the project alternatives, as it is planned for operational or wet weather discharge, during times when recycled water could not be delivered, and to transport brine discharge from reverse osmosis treatment. Due to the need to provide for full discharge flow during wet weather events, the preliminary sizing for the discharge pipeline is the same under each project alternative scenario.

The anticipated water quality requirements for ocean discharge are described in **Section 5.4**. A new NPDES permit will be prepared for the WRF and the effluent limitations are expected to require full secondary treatment at a minimum.

The Draft FMP evaluated two treatment process trains for the WRF based on the community goals for the project: an SBR process (Option A) and an MBR process (Option B). Membrane filters would be installed downstream of the SBR to allow tertiary treatment, and both process alternatives would include disinfection. The Draft FMP provided budgetary-level cost opinions for each alternative. If Alternative 0 is pursued, and the WRF is designed for full secondary treatment instead of treatment to produce disinfected tertiary recycled water, then a SBR plant without the membrane filters would provide full secondary treatment. Assuming membrane filtration and UV disinfection are not required, and disinfection is provided by a chlorine contact basin instead, a full secondary plant is anticipated to cost approximately \$12 million less, as summarized in **Table 7-5**. Though full secondary treatment does not meet the Community project goal of producing tertiary disinfected recycled water, it is anticipated that this treatment level would be required for ocean discharge. Therefore, the cost estimate was developed for this report to provide a basis for evaluation of alternatives and relative cost of a recycled water project.

| Table 7-5: Cost Opinion for Alternative 0 No Recycled Water Project Alternative                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                |                                                   |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Tertiary Disinfected Treatment | Full Secondary Treatment Only (No recycled water) |
| Estimated Construction Cost Opinion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | \$118,600,000                  | \$106,400,000                                     |
| Notes: Estimated cost opinions based on information presented in the Draft FMP for "Option A", SBR process, and includes the WRF lift station, pipelines, and treatment plant without any recycled water components, engineering and design, and 25% construction contingency. Estimated cost for Option B –MBR with tertiary treatment and disinfection is approximately \$120,300,000. This cost opinion does not include additional program costs, such as construction management, property acquisition, and demolition of the existing WWTP. (See Table 7-19 for estimated full WRF program costs). |                                |                                                   |

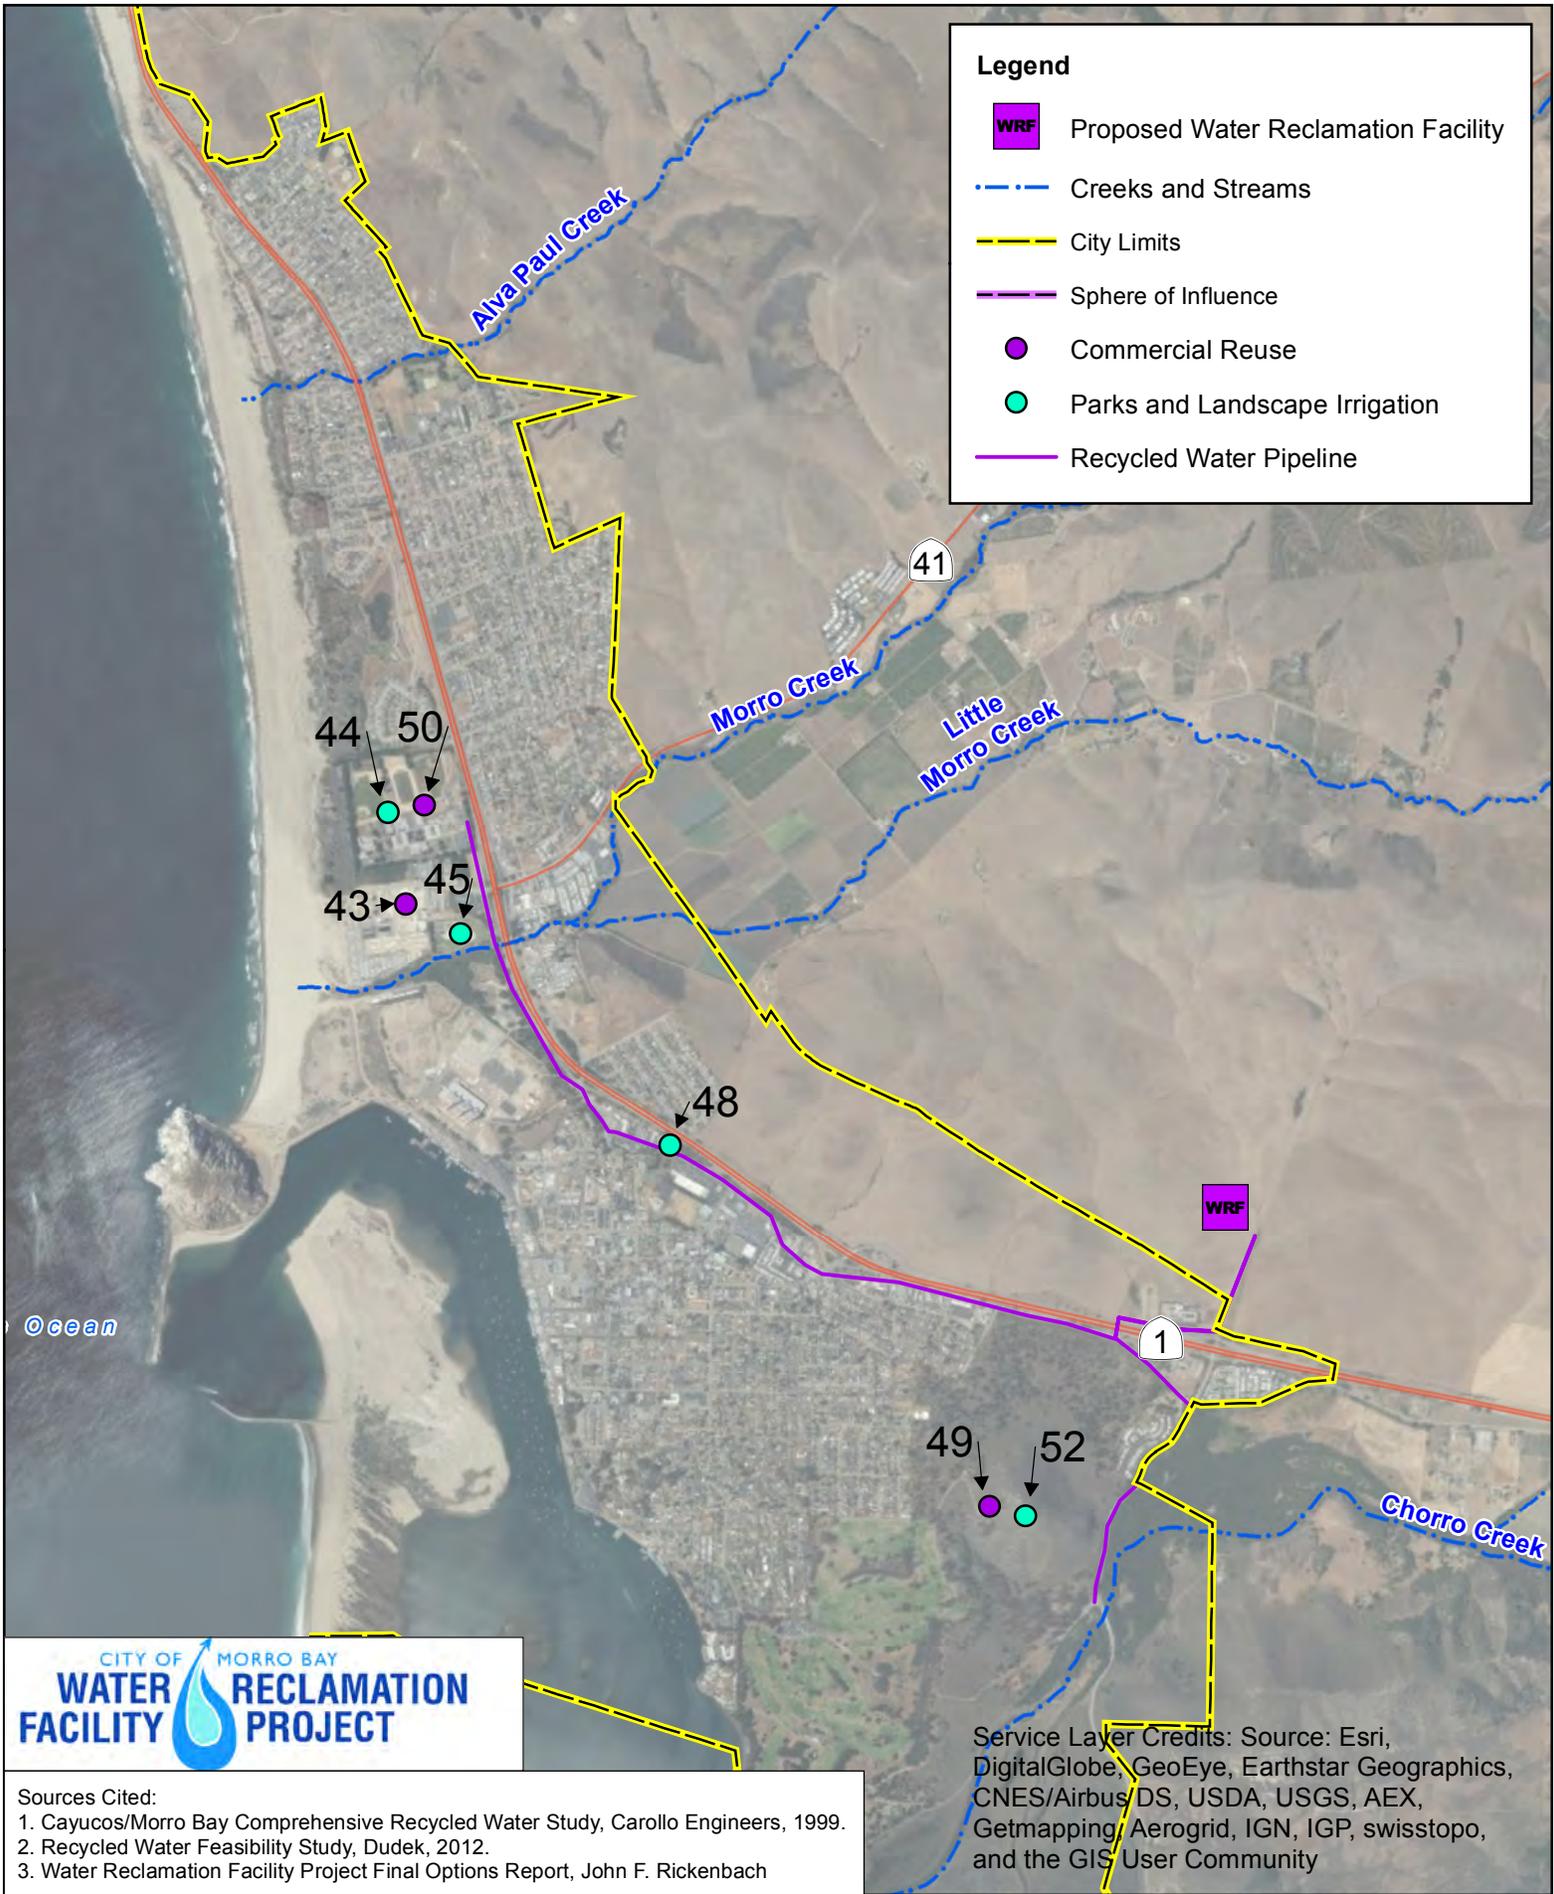

This project alternative would not provide recycled water. Production of recycled water is a community goal defined for the WRF project, and the City has long held a goal to produce and utilize recycled water. The Local Coastal Plan sets reclaimed water as the City’s second highest priority for its water supply, next to State Water; and states that water reclamation should be pursued when funded by a potential user, required as part of a wastewater plant upgrade or permit condition, or when it is shown as cost effective for City use. Whether it is cost effective to produce and distribute recycled water will need to be determined. This alternative is presented to assist with that evaluation. Alternative 0 is anticipated to be the least expensive alternative that would meet discharge requirements.

**7.4 Project Alternative 1: Urban Reuse**

Project Alternative 1: Urban Reuse consists of providing recycled water to urban commercial and landscape irrigation uses in the City and to the Morro Bay Golf Course as shown in **Figure 7.1**.

 Alternative 1: Urban Irrigation

7.4.1 Preliminary Design Assumptions

Water quality regulations (CCR Title 22) require that unrestricted irrigation of commercial landscapes, parks, and playgrounds must be tertiary disinfected recycled water. Some limited commercial uses, such as the High School bus facility and the City maintenance yard, may only require secondary disinfected recycled water. However, the required treatment will be dictated by the highest quality required for the recycled water users. It is anticipated that salts removal (reverse osmosis) will be needed to reduce chlorides and other dissolved solids. However, for this alternative, a side stream of the WRF effluent would be treated by reverse osmosis and blended back with the tertiary disinfected recycled water to achieve the target TDS and chloride concentrations.

The majority of the urban recycled water uses identified are for landscape irrigation of grasses, which are primarily sensitive to chloride concentration in varying degrees, depending on the type of grass. Based on the water quality guidelines for irrigation, chloride concentrations of less than 142 mg/L represent no problem for irrigation, and concentrations between 142 and 355 mg/L represent increasing problems. This study assumes chloride is removed proportionally to TDS, and chloride concentrations between 142 and 355 mg/L are approximately equal to TDS concentrations between 387 and 914 mg/L. A mass balance was performed assuming a tertiary disinfected effluent TDS concentration (influent to the advanced treatment system) of 942 mg/L and a final TDS concentration target of 600 mg/L to estimate the size of the reverse osmosis system. As shown in **Figure 7-2**, this blending scenario would yield a TDS concentration slightly lower than 600 mg/L for planning purposes.

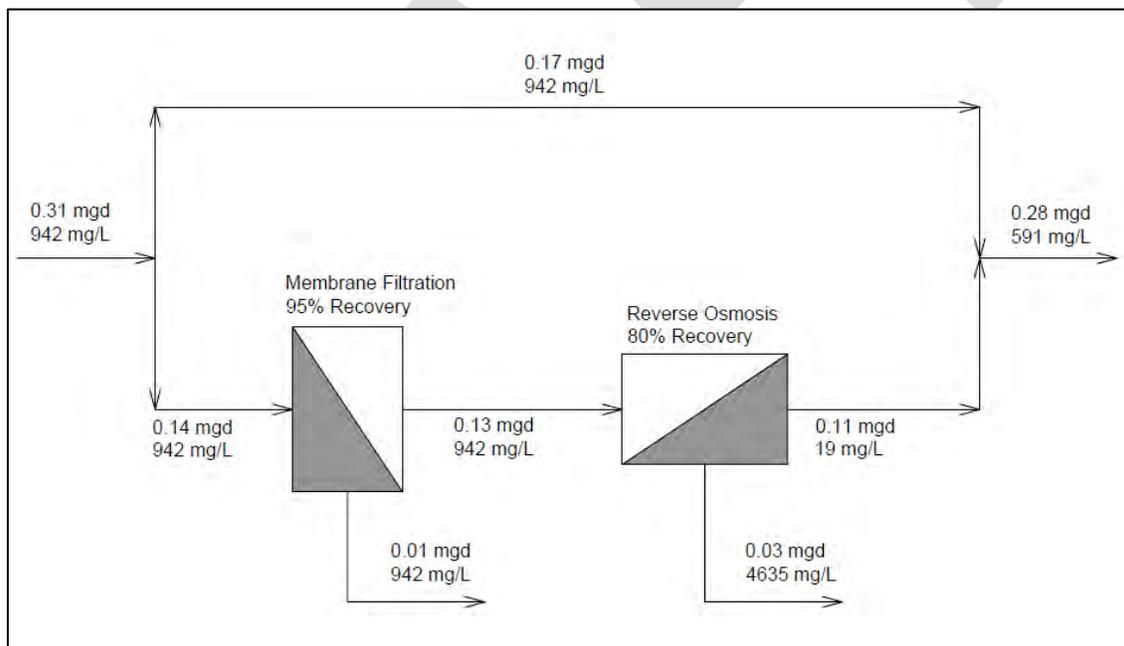

Figure 7-2: Blending Scenario for Alternative 1: Urban Reuse

The preliminary design assumptions for Alternative 1 are summarized in **Table 7-6**. The recycled water opportunities identified for this alternative represent a water demand that is less than half of the estimated recycled water available. To allow for future expansion as additional opportunities are secured, this alternative assumes that the recycled water pipeline from the WRF to the City will be sized for the future potential flow rate. The advanced treatment system is also sized for future potential demands with two trains, providing one redundant train for current demands. It is assumed the recycled water pump station will be sized for current demands and upgraded if/when future opportunities are identified. A recycled water tank at the WRF is recommended to provide operational storage for approximately 20 hours of average day production at buildout.

| Recycled water storage tank volume                                  | 500,000 gallons                     |

**7.4.2 Recycled Water Usage**

The anticipated recycled water users for Alternative 1 are shown on **Figure 7-1** and summarized in the table below. The four potential users in the City make up an estimated 45.4 AFY of water demand, which could be offset by recycled water. These users were chosen because they are near or directly along the anticipated pipeline route for the WRF project, and represent the bulk of the recycled water market. Additional potential recycled water opportunities within the City have been identified in the past, and may be added at some point in the future if the alternative is pursued. The Morro Bay Golf Course may use up to 306 AFY. However, since the golf course does not currently utilize City water, this total would not offset potable water use for the City. It is important to note that nearly 99 percent of the usage for this alternative is for irrigation of landscape. During period of wet weather very little recycled water will be utilized. It is assumed the WRF will discharge to the existing ocean outfall during the wet weather months.

| <b>Table 7-7: Urban Reuse Recycled Water Opportunities</b>                                                                                                                                                                                    |                                    |                   |                                      |

**7.4.3 Preliminary Cost Opinion**

A preliminary opinion of probable cost was developed for general guidance to the City in preparing a planning-level budget and evaluating alternatives. Assumptions have been included based on the information available and preliminary design criteria described above. **Table 7-8** summarizes the opinion of probable construction cost and annual operating and maintenance costs. Appendix B summarizes the methodology and assumptions used to develop the cost opinion.

**7.4.4 Preliminary Alternative Evaluation**

The total estimated recycled water demand for Alternative 1 is approximately 40% to 45% of the estimated recycled water available. The majority of the potential recycled water use under this alternative is allocated to the Morro Bay Golf Course. Since the golf course does not use City water, the potential water supply benefit for this alternative is limited to up to 45.4 AFY (approximately 5% of the recycled water available).

The capital and estimated annual operating costs are relatively low compared to the other options. However, the annual cost per acre-foot of potential water supply benefit is very high, due to the low benefit to potable water supplies.

Each recycled water customer would require a service lateral and flow meter, and onsite retrofits for cross connection control between recycled water and potable water plumbing. Service connections and onsite retrofits vary in size, complexity, and cost; therefore, these costs are not reflected in the preliminary cost opinion above.

The energy use for this alternative is relatively low, with an estimated 15% of the effluent requiring advanced treatment (for current identified opportunities) and approximately 25 hp pumps required for recycled water delivery.

Design of onsite irrigation systems will be required to limit the potential for human contact and have signs posted to clearly indicate the use of recycled water. All major above-grade infrastructure for the project will be contained at the WRF site. Compatibility with neighbors is considered to be favorable for this alternative.

**7.5 Project Alternative 2: Agricultural Exchange**

Project Alternative 2: Agricultural Exchange consists of delivering recycled water to agricultural properties for the purposes of irrigation in exchange for groundwater pumped and delivered to the City. Major project components and

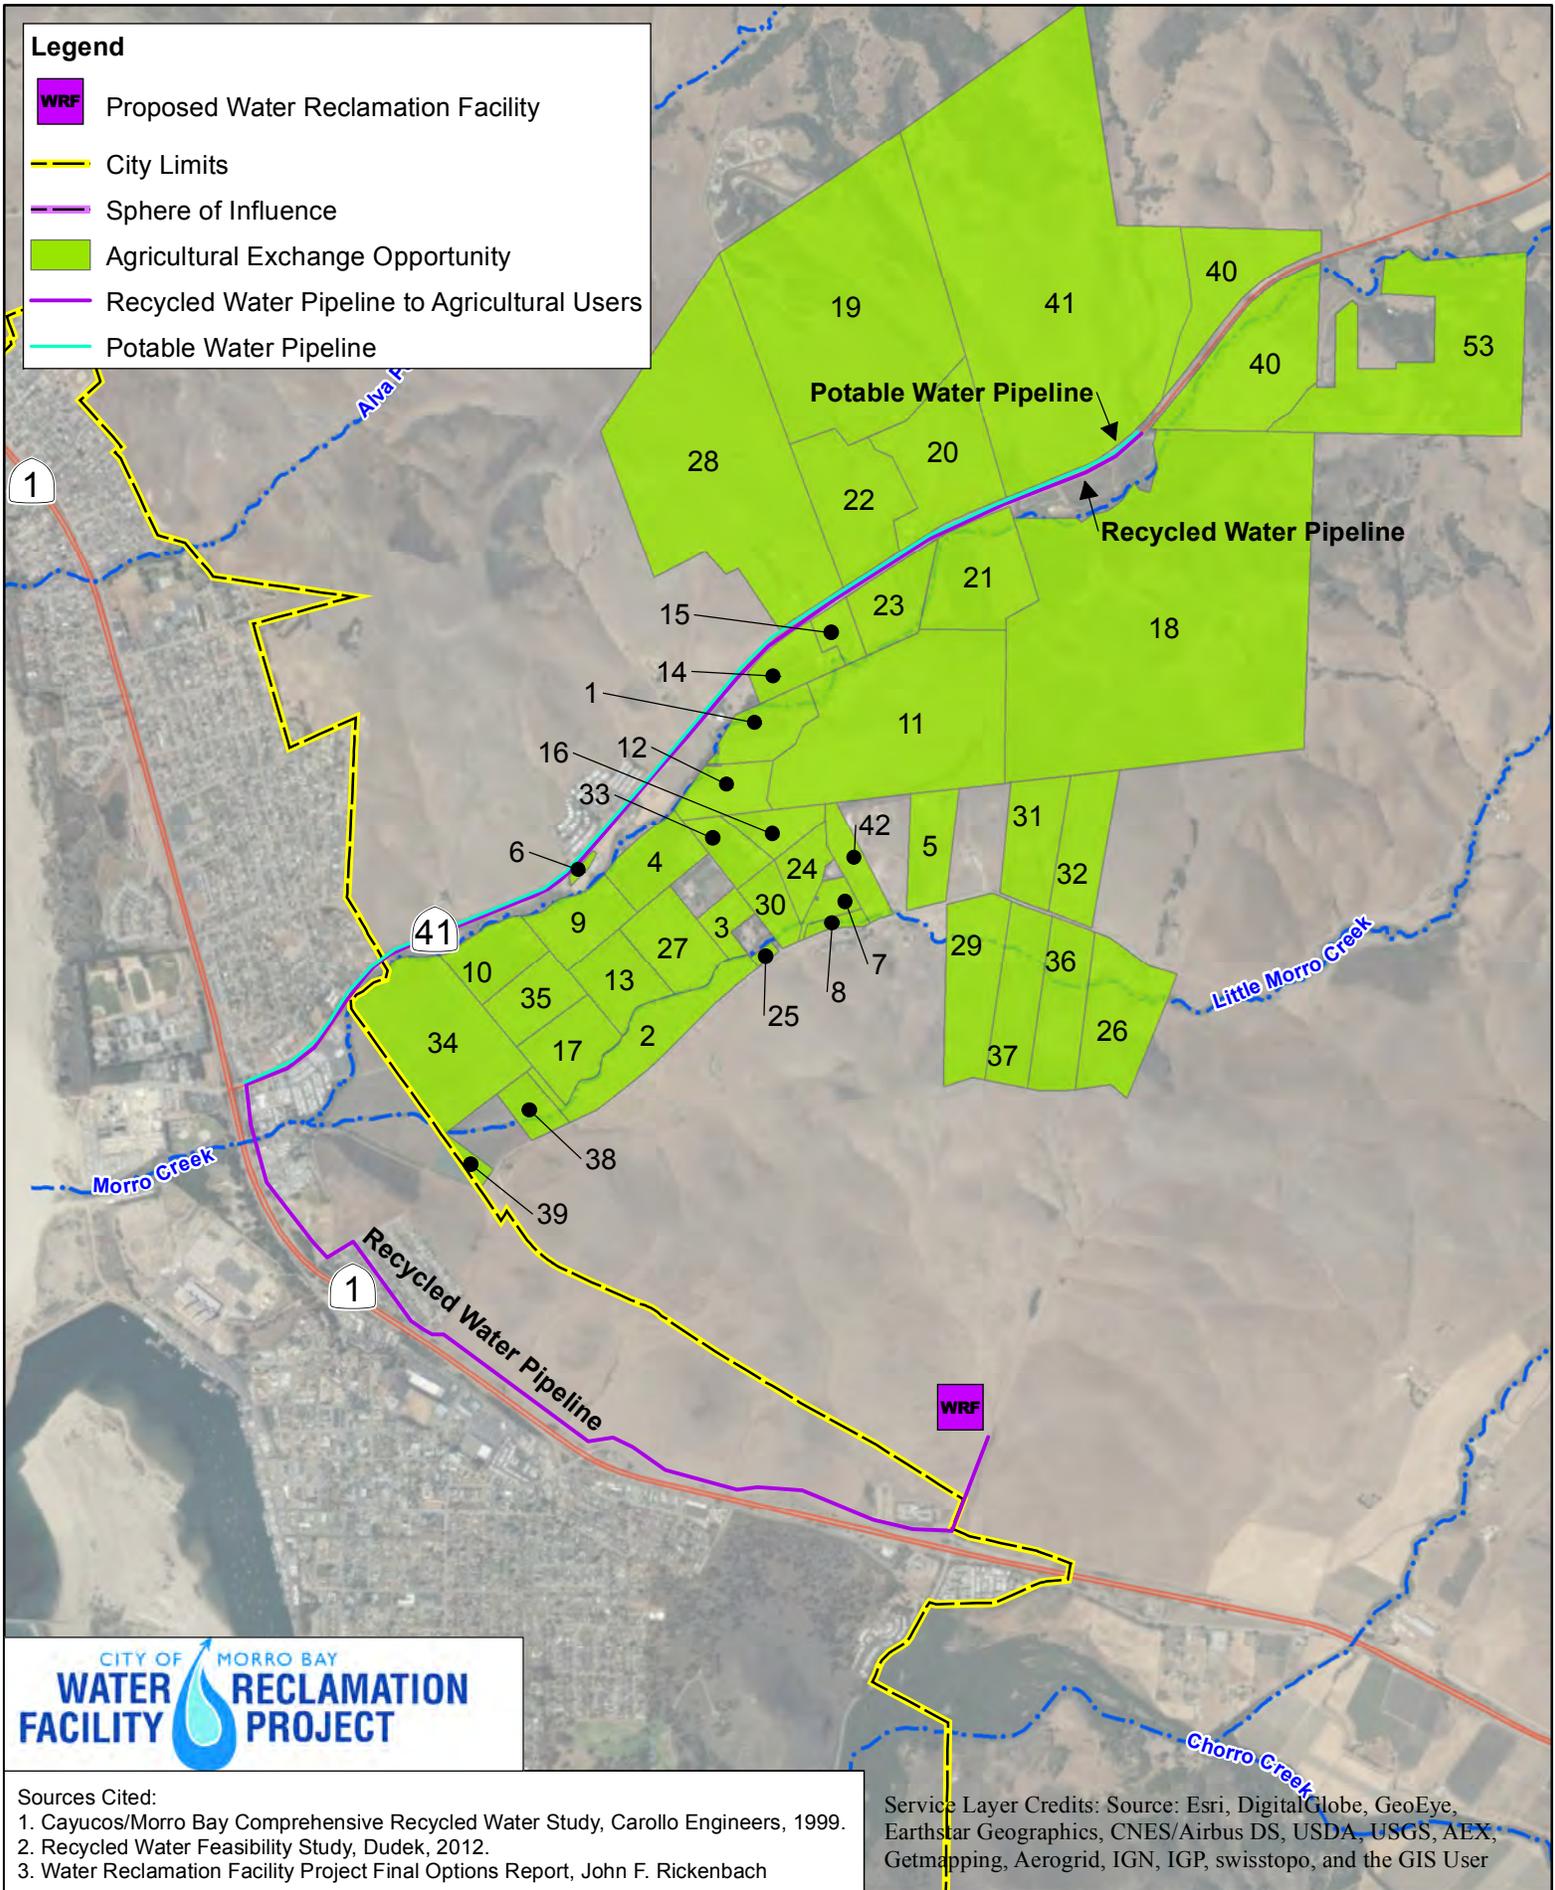

potential agricultural exchange opportunities are shown in **Figure 7-3**. Demands associated with each property are referenced in the figure by site number and can be seen in **Table 7-10**. For the scenario to be attractive to the agricultural community, it is assumed the volume of groundwater delivered back to the City would be less than the volume of recycled water provided. The City would install and operate a new well pump at the landowner’s existing well and a potable water pipeline back to the City’s system. Alternatively, a branch from the land owner’s existing wellhead and a booster pump station could be installed to feed the potable water line back to the City. If the groundwater is extracted from the upper Morro Valley, the quality may be such that additional treatment (beyond disinfection) is not required.

### 7.5.1 Preliminary Design Assumptions

To evaluate the alternative, this study assumes one to three landowners in the upper Morro Valley will participate. Negotiations and contracts would need to be developed with the individual land owners, but for the purposes of this study, it is assumed that the contracts would outline a two-to-one ratio of recycled water delivered to groundwater returned.

Based on the water quality regulations (CCR Title 22), undisinfected secondary recycled water could be used to irrigate orchards where the edible portion does not contact the recycled water. However, due to the chloride sensitivity of avocado trees, advanced treatment (reverse osmosis) will be needed.

Reverse osmosis systems require a high quality influent to maintain reasonable costs for membrane operation and maintenance. Additionally, one of the WRF Project Community Goals is to produce disinfected tertiary recycled water. Both treatment process trains described in the Draft FMP would provide tertiary disinfected recycled water quality, and adequate treatment for a reverse osmosis system.

For this alternative, a side stream would be treated by the reverse osmosis system and blended back with the tertiary disinfected recycled water to achieve the target TDS and chloride concentrations. The majority of the agricultural irrigation in the Morro Valley is for avocado crops, which are primarily sensitive to chloride concentrations. This study assumes a target chloride concentration goal of less than 80 mg/L. Unfortunately, existing analyses of WWTP effluent do not include chloride analysis, so an estimate of chloride concentration was made by assuming bicarbonate concentration of 350 mg/L, sulfate of 40 mg/L, and hardness of about 200 mg/L (as CaCO<sub>3</sub>). Using these values and TDS of 942 mg/L, sodium chloride concentration is estimated at 482 mg/L, giving chloride concentration of 258 mg/L. This chloride concentration is consistent with the collection system testing performed in June and July of 2016 as part of the Salinity Source Identification and Control Program, which found average daytime and nighttime chloride concentrations of 172 mg/L and 319 mg/L, respectively. Reverse osmosis (RO) performance projections using this assumed water quality predict permeate chloride concentration of 3.5 mg/L. Mass balance calculations indicate that a blended water TDS concentration of about 300 mg/L will provide the desired chloride concentration of 80 mg/L. This blend consists of about 75 percent RO permeate and 25 percent effluent. With RO recovery of 80 percent and effluent flow of 0.97 MGD, blended irrigation water production will be about 0.79 MGD (**Figure 7-4**).

**Figure 7-4:** Blending Scenario for Alternative 2: Agricultural Exchange

The preliminary design assumptions for Alternative 1 are summarized in **Table 7-9**. A recycled water tank at the WRF is recommended to provide operational storage, which might not be required if the recycled water users are able to provide adequate operational storage. This study assumes a constant delivery rate equal to the average daily flow.

**7.5.2 Recycled Water Usage**

This study assumes one to three large landowners will participate in a program to receive the full amount of recycled water available at a constant rate in exchange for groundwater at a two to one ratio, respectively. Based on the anticipated treated effluent flow rates from the Draft FMP and the water quality requirements for the recycled water, a mass balance was developed as described above, estimating approximately 885 AFY of recycled water will be available. From initial discussions with potential users, the assumed potential water supply benefit to the City is half this amount, 442 AFY.

A preliminary list of potential users and preliminary water demand estimates is included below in **Table 7-10**. Preliminary demand estimates assume 2.5 feet per year per acre of irrigated area. Site numbers correlate with opportunities presented in **Figure 7-3**.

Note: Demands estimated by owner or by assuming 2.5 feet/year/irrigated acre

**7.5.3 Preliminary Cost Opinion**

A preliminary opinion of probable cost was developed for general guidance to the City in preparing a planning-level budget and evaluating alternatives. Assumptions have been included based on the information available and preliminary design criteria described above. **Table 7-11** summarizes the opinion of probable construction cost and annual operating and maintenance costs. Appendix B summarizes the methodology and assumptions used to develop the cost opinion.

| <ol style="list-style-type: none"> <li>1. Cost of groundwater pump or potable water booster station and associated piping, electrical, and instrumentation is not included in this cost opinion. Cost opinion includes the recycled water project only, and does not include costs for the WRF.</li> <li>2. Cost opinion assumes new potable water pipeline will tie to the City's system east of Hwy 1 and no highway crossing would be required.</li> </ol> |                       |             |                  |                             |

#### 7.5.4 Preliminary Alternative Evaluation

This analysis assumes Alternative 2 could utilize the full amount of recycled water available and provide a potable water supply benefit to the City of 442 AFY, approximately half of the recycled water delivered.

When compared to Alternative 1, the capital and estimated annual operating costs are higher. However, the annual cost per acre-foot of potential water supply benefit is much lower than Alternative 1, due to the greater estimated water supply benefit.

Each recycled water customer would require a turnout and a flow meter, and onsite retrofits for cross connection control may be required. Service connections and onsite retrofits vary in size, complexity, and cost. It is assumed the individual landowners will be responsible for compliance with the regulations and associates costs for recycled water usage and systems within their properties. For example, retrofits to existing irrigation systems may be required to ensure compliance with the regulations, which include application at agronomic rates and no runoff or overspray from the property.

The energy use for this alternative is moderate, compared to the other alternatives, with an estimated 70 percent of the effluent requiring advanced treatment and approximately 45 horsepower required for recycled water pumping.

All major above-grade infrastructure for the project will be contained at the WRF site. With regard to infrastructure and potential visual, odor, or noise impacts, compatibility with neighbors is not considered to be significant for this alternative. However, there has been some concern expressed by agricultural landowners in the Morro Valley regarding the potential impact to crop value and private drinking water wells from irrigation with recycled water on adjacent or nearby properties. Title 22 requires no runoff of recycled water from property edges, and a minimum 100-foot setback of recycled water irrigation and recycled water impoundments from any domestic water supply wells. A well survey and Title 22 report would be required to ensure proper setbacks from drinking water wells.

To date, the City has not entered into any agreements with landowners in the Morro Valley to receive recycled water. There is limited interest in utilizing recycled water, and general unwillingness to enter into a contract with the City to reduce pumping or provide groundwater, with the exception of a few Morro Valley landowners who have expressed interest in developing a memorandum of understanding for a mutually beneficial exchange arrangement. To date, discussions with these landowners have been preliminary and the terms have not been negotiated. Any changes to the water quality requirements, amount of recycled water delivered, and/or amount of potable water for the City would affect the cost opinion and assessment. Should the City wish to pursue this alternative, the legal rights associated with the users delivering water outside of their property would need to be explored.

#### 7.6 Project Alternative 3: Indirect Potable Reuse – East

Project Alternative 3: Indirect Potable Reuse – East involves conveying recycled water to four separate injection wells near the Narrows where it will be used to replenish the groundwater basin as shown in **Figure 7-5**. The water will be extracted from existing City wells and treated at the City's existing BWRO treatment facility for potable use. The recycled water pipeline would run along the eastern side of Highway 1 to Bolton Drive, east on Radcliff Avenue, north on Main Street, and West down Errol Street. At this point in time the City has not acquired land or investigated potential right of way acquisition to construct the injection wells and a siting study would be required to identify and evaluate potential injection well locations.

##### 7.6.1 Preliminary Design Assumptions

Title 22 requires any GRRP using subsurface application to treat the recycled water using full advanced treatment. The accepted technology for full advanced treatment is reverse osmosis and an AOP. General injection and recovery well locations were derived using hydraulic modeling, and driven by residence time requirements set by the California DDW As described in **Section 5.5**, residence time credits are granted through evidence of retention through groundwater modeling or pilot testing.

A storage tank of 500,000 gallons was assumed for this alternative to provide operation storage for equipment maintenance or precipitation events which may inhibit the ability to add water to the aquifer. The tank will allow for at least two days of operating volume for two injection wells. The preliminary design assumptions for Alternative 3 are summarized in **Table 7-12**.

**7.6.2 Recycled Water Usage**

Preliminary hydraulic modeling summarized in the report, “Lower Morro Valley Basin Screening-Level Groundwater Modeling for Injection Feasibility” (Draft January 30, 2017, GSI Water Solutions, Inc.) concluded that an injection and pumping configuration of four new injection wells near the narrows and extraction from five existing City wells could achieve injection of the full volume of recycled water (up to 825 AFY) and could support extraction of 943 AFY. According to the model, total amount of extraction is limited by seawater intrusion. The City’s existing wells would not require any updates in order to capture the recycled water. The modeling also concluded that additional wells may be needed depending on how often the injection wells clog. To verify the results of the model and begin permitting discussion with DDW, pilot scale testing is recommended and DDW should be involved in the planning and implementation thereof. Since the residence time demonstrated in the groundwater models was close to the required four months of residence time, permitting would likely not move forward based on the model results alone. Pilot testing will allow the City to refine preliminary assumptions, design criteria, and budgetary cost opinion.

It is assumed that the groundwater extracted from the City wells will be treated at the existing water treatment plant through the BWRO system. Groundwater from the Morro Valley is high in nitrates and TDS. Over time, these concentrations may become lower with the influence of the highly treated recycled water. The BWRO system currently has an efficiency of 80%, with 20% of the product lost as concentrate. In addition to pilot testing, it is recommended that the City perform an assessment of the additional treatment than may be required for the groundwater. It is possible that acceptable quality could be achieved by treating a portion of the groundwater through the BWRO and blending with the rest, thereby reducing the amount of water lost through treatment.

**7.6.3 Preliminary Cost Opinion**

A preliminary opinion of probable cost was developed for general guidance to the City in preparing a planning-level budget and evaluating alternatives. Assumptions have been included based on the information available and preliminary design criteria described above. **Table 7-13** summarizes the opinion of probable construction cost and annual operating and maintenance costs. **Appendix B** summarizes the methodology and assumptions used to develop the cost opinion.

| 1. Cost opinion does not include property research, land acquisition, or pilot testing. Cost opinion includes the recycled water project only, and does not include costs for the WRF. |                       |

**7.6.4 Preliminary Alternative Evaluation**

Alternative 3 would utilize the full amount of recycled water available and provide an estimated potable water supply benefit to the City of 993 AFY. This would be a significant addition to the City’s potable water portfolio, representing nearly 90% of the City’s potable water demand, based on the 2015 value (1,074 AF). As described in **Section 3**, the City currently participates in the State Water Project (SWP) through a contract with Central California Water Authority (CCWA). With an allocation of 1,313 AFY, take-or-pay stipulations, and unpredictable availability, the annual cost of State Water varies. The City’s State Water cost is estimated at \$1,600 per AF at full allocation. The cost for 2016/17 fiscal year was \$2,100 per AF.

When compared to Alternatives 1 and 2, the capital and estimated annual operating costs are higher. However, the annual cost per acre-foot of potential water supply benefit is lower than the first two alternatives, due to the greater estimated water supply benefit.

Alternative 3 has greater reliability than the first two alternatives due to no additional recycled water customers to coordinate with or contracts to negotiate.

The energy use for this alternative is high compared to the other alternatives, with the full volume of recycled water requiring advanced treatment, although recycled water pumping requirements are relatively low at a motor size of approximately 30 hp.

The major above-grade infrastructure for the project will be contained at the WRF site, with the exception of the injection and monitoring wells. Potential impacts of the injection and monitoring wells are considered minor. The injection wells should require a relatively small site, with some manifold piping, a motorized flow control valve and flow meter, and electrical and controls panels. No pumps or motors will be needed at the wells.

**7.7 Project Alternative 4: Indirect Potable Reuse – West**

Project Alternative 4: Indirect Potable Reuse - West involves conveying recycled water to 4 separate injection wells near the bike path north of the power plant where it will be used to replenish the groundwater table as shown in **Figure 7-6**. The water will be extracted from existing City wells for treatment at the City BWRO treatment facility. The recycled water pipeline would run along the western side of Highway 1 along Quintana Road to Main Street where it would generally follow the bike path to the injection wells. At this point in time the City has not acquired land or investigated potential right of way acquisition to construct the injection wells and a siting study would be required to identify and evaluate potential injection well locations.

**7.7.1 Preliminary Design Assumptions**

Title 22 requires any GRRP using subsurface application to treat the recycled water using full advanced treatment. The accepted technology for full advanced treatment is reverse osmosis and an AOP. General injection and recovery well locations were derived using hydraulic modeling, and driven by residence time requirements set by the California DDW. As described in **Section 5.4.5**, residence time credits are granted through evidence of retention through groundwater modeling or pilot testing.

A storage tank of 500,000 gallons was assumed for this alternative to provide operation storage for equipment maintenance or precipitation events which may inhibit the ability to add water to the aquifer. The tank will allow for at least two days of operating volume for two injection wells. The preliminary design assumptions for Alternative 4 are summarized in **Table 7-14**.

**7.7.2 Recycled Water Usage**

Preliminary hydraulic modeling summarized in the report, “Lower Morro Valley Basin Screening-Level Groundwater Modeling for Injection Feasibility” (Draft January 30, 2017, GSI Water Solutions, Inc.) concluded that an injection and pumping configuration of four new injection wells near the bike path and power plant property and four existing wells pumping could achieve injection of nearly the full volume of recycled water (804 AFY) and could support extraction of 1,119 AFY. The City’s existing wells would not require any updates in order to capture the recycled water. The modeling also concluded that additional wells may be needed depending on how often the injection wells clog.

To verify the results of the model and begin permitting discussion with DDW, pilot scale testing is recommended and DDW be involved in the planning and implementation thereof. Since the residence time demonstrated in the groundwater models was close to the required four months of residence time, permitting would likely not move forward based on the model results alone. Pilot testing will allow the City to refine preliminary assumptions, design criteria, and budgetary cost opinion.

It is assumed that the groundwater extracted from the City wells will be treated at the existing water treatment plant through the BWRO system. Groundwater from the Morro Valley is high in nitrates and TDS. Over time, these concentrations may become lower with the influence of the highly treated recycled water. The BWRO system currently has an efficiency of 80%, with 20% of the product lost as concentrate. In addition to pilot testing, it is recommended that the City perform an assessment of the additional treatment than may be required for the groundwater. It is possible that acceptable quality could be achieved by treated a portion of the groundwater through the BWRO and blending with the rest, thereby reducing the amount of water lost through treatment.

**7.7.3 Preliminary Cost Opinion**

A preliminary opinion of probable cost was developed for general guidance to the City in preparing a planning-level budget and evaluating alternatives. Assumptions have been included based on the information available and preliminary design criteria described above. **Table 7-15** summarizes the opinion of probable construction cost and annual operating and maintenance costs. **Appendix B** summarizes the methodology and assumptions used to develop the cost opinion.

| 1. Cost opinion does not include property research, land acquisition, or pilot testing. Cost opinion includes the recycled water project only, and does not include costs for the WRF. |                       |

**7.7.4 Preliminary Alternative Evaluation**

Alternative 4 would utilize the full amount of recycled water available and provide an estimated potable water supply benefit to the City of 1,119 AFY. This would be a significant impact to the City’s potable water portfolio, fulfilling all of the City’s current potable water demand, based on the 2015 value (1,074 AF). As described in **Section 3**, the City currently participates in the State Water Project (SWP) through a contract with Central California Water Authority (CCWA). With an allocation of 1,313 AFY, take-or-pay stipulations, and unpredictable availability, the annual cost of State Water varies. The City’s State Water cost is estimated at \$1600 per AF at full allocation. The cost for the 2016/17 fiscal year was \$2,100 per AF.

When compared to other alternatives, the capital and estimated annual operating costs are highest. However, the annual cost per acre-foot of potential water supply benefit is lowest, due to the greatest estimated water supply benefit.

Alternative 4 has greater reliability than the first two alternatives due to no additional recycled water customers to coordinate with or contracts to negotiate.

The energy use for this alternative is high compared to the other alternatives, with the full volume of recycled water requiring advanced treatment; though recycled water pumping requirements are the lowest of the three alternatives, at approximately 10 horsepower.

The major above-grade infrastructure for the project will be contained at the WRF site, with the exception of the injection and monitoring wells. Potential impacts of the injection and monitoring wells are considered minor. The injection wells should require a relatively small site, with some manifold piping, a motorized flow control valve and flow meter, and electrical and controls panels. No pumps or motors will be needed at the wells.

**7.8 Summary of Project Alternatives**

A qualitative comparison of the four recycled water project alternatives is summarized in **Table 7-16** based on the community project goals. Alternative 0 is not included, since it would not provide a recycled water project. **Table 7-17** contains the qualitative ranking with 1 being low and 4 being high.

| <b>Table 7-16: Recycled Water Project Qualitative Comparison</b> |                                                                                    |                                                                                      |                                                               |                                                                        |

A summary of the project alternative capital and annual costs and potable water supply benefit is provided in **Table 7-18**. The capital costs include the WRF lift station, pipelines, and treatment facilities, and the recycled water advanced treatment, pump station, storage tank, injections wells, pipelines, engineering and design, and construction contingency. Additional program costs associated with the project are described in **Table 7-19**.

| Notes:<br>1) Annualized Project Cost (SRF Loan, 3% Interest, 30-year period; A/P = 0.051)<br>2) Estimated water supply benefit for Alternative 1 does not include Morro Bay Golf Course and State Park (306 AFY demand) as they currently use a non-potable well.<br>3) Alternative 0 is not included here, as the estimated capital construction cost for recycled water project would be \$0 and there would be no water supply benefit.<br>4) Estimated Recycled Water Annual O&M Costs and Total Estimated Recycled Water Project Annual Costs for Alternatives 3 and 4 include \$1000 per acre-foot (for 943 acre-feet and 1119 acre-feet, respectively) for extraction and treatment of groundwater at the existing water treatment plant.<br>5) Additional program costs, such as construction management, property acquisition, and demolition of the existing WWTP, are not reflected here. See Table 7-19. |                      |                              |                      |                      |

**7.9 Conclusions from Project Alternatives Evaluation**

The recycled water project alternatives were evaluated based on the community goals for the project. Evaluation criteria include capital cost, operating cost, neighborhood compatibility, reliability, and potential water supply benefit. The following main conclusions can be made:

- The highest water supply benefit would be realized through indirect potable reuse (IPR) (Alternatives 3 and 4). Based on preliminary modeling, it appears Alternative 4 could support the majority, if not all, of the City’s current water demand with an estimated water supply benefit of over 1100 AFY. This could significantly reduce or eliminate reliance on imported water.
- The least expensive alternative is no recycled water project (Alternative 0), followed by urban reuse (Alternative 1). Alternative 0 provides no water supply benefit and Alternative 1 provides the least, an estimated 45.4 AFY water supply benefit.
- The capital costs for agricultural exchange (Alternative 2) and IPR (Alternatives 3 and 4) are similar, but IPR has significantly higher water supply benefit if a higher exchange rate is not possible for Alternative 2. Agricultural exchange relies on successful contract negotiations with landowners, adding some uncertainty.

Based on the analyses presented herein, the recommended recycled water project is IPR, Alternative 3 or 4, with the main difference consisting of the locations for injection and extraction wells. The IPR alternative provides the highest potential water supply benefit. Supplementing the potable water supply with highly treated recycled water is the highest form of allowable beneficial reuse, and will allow the City to reduce or eliminate reliance on imported water.

To further refine the project assumptions and costs, the recommended next steps are summarized as follows:

- Rate study update
- Consultation with DDW
- Siting study for injection wells
- Pilot study for injection and extraction
- Groundwater modeling update (after/with pilot study)
- Assessment of groundwater treatment and blending options at existing WTP
- Design of recycled water system, including advanced treatment, injection wells, pumps and pipelines

The City is planning to construct the new WRF within the next five years. If a recycled water project is pursued, there could be significant savings realized by completing the construction at the same time as the WRF. The estimated total program capital costs for Alternatives 0 through 4 are summarized in **Table 7-19**. The total program costs include the total cost for the WRF as presented in the Facility Master Plan; additional estimated program costs including decommissioning of the existing WWTP, property acquisition for the WRF, permitting and environmental mitigation, and construction management; and estimated recycled water project costs as presented earlier in this section.

Alternative 0 (No Recycled Water Project) presents a WRF that produces secondary disinfected effluent which is discharged to the ocean for an estimated total program cost of approximately \$124 million. Alternatives 3 and 4, the recommended recycled water project, consists of a WRF and full IPR recycled water program for an estimated total cost of approximately \$167 million.

**Table 7-19: Comparison of Total Estimated Program Costs**

| <b>Subtotal Program Capital Cost Opinion (rounded)</b>     | <b>\$104,200,000</b>                              | <b>\$128,900,000</b> | <b>\$141,700,000</b>         | <b>\$140,400,000</b> | <b>\$140,700,000</b> |
| Construction Contingency                                   | \$19,320,000                                      | \$24,040,000         | \$26,370,000                 | \$26,220,000         | \$26,290,000         |
| <b>Total Program Capital Cost Opinion</b>                  | <b>\$123,520,000</b>                              | <b>\$152,940,000</b> | <b>\$167,570,000</b>         | <b>\$166,620,000</b> | <b>\$166,990,000</b> |

**Notes:**

- 1) Estimated WRF Capital Construction Cost includes the WRF Project (lift station, pipelines, and treatment plant) without any recycled water components, based on costs presented in the Draft FMP, not including construction contingency or engineering/design, which are shown separately.
- 2) Cost assumptions for Alternative 0 are based on secondary treatment only, SBR option as described in **Section 7.3**. Alternative 0 does not fulfill the community project goals to produce tertiary disinfected wastewater or to produce reclaimed water.
- 3) WRF costs for Alternatives 1 – 4 assume the MBR option from the Draft FMP. Based on estimates in the Draft FMP, the total program capital cost opinion for Alternatives 1 – 4 would be approximately \$2M less with the SBR option.
- 4) Construction contingency consists of 25% of construction cost subtotal(s).

## 7.10 Environmental Considerations

An Environmental Impact Report (EIR) is currently being prepared for the proposed WRF and related actions, including the Master Water Reclamation Plan. The scope of the EIR is based on the Notice of Preparation (NOP) that was publicly distributed on August 8, 2016. In addition, there was a public workshop held on August 16, 2016, to take further input on the scope of the EIR. Because an EIR is being prepared, no Initial Study was required or prepared. Instead, the NOP identifies the following issues areas for comprehensive review in the EIR, consistent with most of the issues included in the CEQA Initial Study Checklist:

- Aesthetics
- Agricultural and Forestry Resources
- Air Quality
- Biological Resources
- Cultural and Paleontological Resources
- Geology, Soils and Seismicity
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Recreation
- Noise
- Population and Housing/Growth Inducement
- Public Services
- Traffic and Transportation
- Utilities and Energy
- Cumulative Impacts

The NOP, included as Appendix D, contains a complete discussion of each of these issues, and how the analysis of each will be framed within the EIR. The Draft EIR is expected to be publicly available in August 2017, with the Final EIR likely to be completed and certified in November 2017.

## EXHIBIT VII. SYSTEM ENGINEER'S REPORT

A summary of the most relevant plans is included in Section B, page B-9. At this time, there is nothing to submit for **Exhibit VII**.

## EXHIBIT VIII. OPERATIONS AND MAINTENANCE PLAN

The Design-Build Contractor will be responsible for developing a Final Operations and Maintenance Plan as part of asset management included in their scope of work. A draft Operations and Maintenance Plan is included in Section C. At this time, there is nothing to submit for **Exhibit VIII**.

## EXHIBIT IX. CASH FLOW PRO FORMA

The Cash Flow Pro Forma is attached as **Exhibit IX**, and is provided in Excel format.

## EXHIBIT X. SOURCES OF FUNDS

The City of Morro Bay has initiated the application for a Clean Water State Revolving Fund loan with the California State Water Resources Control Board. The City will provide documentation when the loan is approved. If the loan is not approved, the City will pursue bond financing for 49% of the total project cost. A table outlining sources of funds for the Water Reclamation Facility Project is included as part of **Exhibit X**.

## EXHIBIT XII. PRELIMINARY RATING LETTER

The City of Morro Bay has prepared information and conducted informational phone calls with Standard & Poor's Global Ratings agency. The preliminary rating letter is attached as **Exhibit XII**.

July 6, 2018

Ms. Jennifer Callaway  
Finance Director,  
City of Morro Bay  
595 Harbor Street  
Morro Bay, CA 93442.  
(805) 772-6200

Dear Ms. Callaway:

Thank you for requesting that S&P Global Ratings provide you with feedback through its Rating Evaluation Service (RES) on the initial indicative credit rating implications to the City of Morro Bay (the “Issuer” or “you”) of implementing the proposed scenario described below. S&P Global Ratings has reviewed the scenario you have provided and the following is a summary analysis reflecting our RES committee response.

### **Existing Rating**

The Issuer currently does not have a rating on any debt obligations related to the proposed scenario.

### **Scenario Presented**

The Issuer presented one scenario to S&P Global Ratings involving the proposed issuance in June 2018 of \$60.2 million of the Water Infrastructure Finance and Innovation Act [WIFIA] Loan (the “Proposed Obligations”). The Proposed Obligations would be used to provide funding for a new Water Reclamation Facility (WRF) project being built via a design-build process (the “Proposed Project”). The Proposed Project is one of the 12 water or sewer utilities nationwide selected for the first round of funding under a new EPA loan program (enacted as the WIFIA).

The total project cost for the WRF is estimated at \$122.8 million. The Issuer has presented a financing plan with a base case scenario, which assumes the WIFIA loan amount that does not exceed 49% of eligible project costs. The remainder will be funded from other obligations including State Revolving Fund (SRF) loans and available cash funding from rate increases & proposed new WRF Surcharges from the issuer’s water and sewer utility revenue funds. The Issuer has previously obtained a \$10.3 million SRF Planning Loan.

Based on the WIFIA letter of interest, the Proposed Obligations will be expected to be issued on parity with or senior to any existing and proposed obligations. In a bankruptcy related event, the WIFIA loan will rank *pari passu* in right of payment and right of security with any proposed

parity-lien obligation. The payments to the Proposed Obligations will be secured by a lien on a new WRF debt repayment fund for the full debt service, with payments to the WRF debt repayment fund secured by net revenues of the water and sewer utility funds, with each covenanting to repay their fund's allocated share of debt service, and covenanting to raise rates and charges as needed to achieve debt service coverage of 1.20x on each utility fund's share of debt repayment. If other legal provisions are identified in the future, it could likely lead to an impact on either our rating or outlook.

### **Summary of Indicative Rating Conclusion**

#### **Scenario**

With respect to the Scenario presented, the RES committee has determined that the issuance of the Proposed Obligations would likely result in S&P Global Ratings assigning a 'A' rating to the Proposed Obligations, assuming no other significant rating factor has changed. Additionally, the outlook would likely be stable, but we would note that any further increases in debt obligations would likely have rating implications. The preceding assumes that the scenario is implemented in accordance with information and representations provided by the Issuer to S&P Global Ratings.

#### **S&P Global Ratings current Evaluation of the Issuer:**

Based on the financial plan, the WRF project cost estimates reflect a 29% cost allocation to the water utility and a 71% cost allocation to the sewer utility. Each utility is responsible for funding its share of project costs. Because neither system is obligated to cover the other's obligations under the WIFIA loan, deterioration in credit quality of either system would lead to a lowered rating. The rating is based on a weak-link structure, as there is no ability under the proposed agreement to reallocate debt service costs among the enterprise systems. The rating is currently based on the credit quality of the sewer system, which we view as the weaker of the two systems.

The rating reflects, in our opinion, the combination of a strong enterprise and financial risk profiles.

The enterprise risk profile reflects our view of the utility system's:

- Service area participation in the broad and diverse San Luis Obispo-Paso Robles-Arroyo Grande metropolitan area economy, with good median household income indicators;
- Very low industry risk as a monopolistic service provider of an essential public utility;
- Service rates, which we view as moderately elevated, in the context of the service area's income levels and local poverty rate, after including the likely adoption of supplemental WRF Surcharges to support funding for the new wastewater treatment plant; and
- Good operational management practices and policies, with a focus on developing a new WRF with a potential recycled water production & indirect potable reuse via groundwater replenishment.

The financial risk profile reflects our view of the utility system's:

- Good projected all-in debt service coverage (DSC) metrics, with a financial plan that we believe will establish a clear trajectory of future financial performance for both water and sewer systems, but could be pressured if timely rate and surcharges are not implemented;
- Projected strong liquidity position that, according to the financial plan, may be drawn down somewhat, but is anticipated to remain strong and aligned with its reserve policy;
- Manageable capital improvement plans and WRF funding needs that the city plans to finance with a mix of leverage and cash funding;
- Highly leveraged position (as measured by the utility system's pro-forma debt-to-capitalization ratio); and
- Good financial management practices and policies.

**General Assumptions (for all scenarios):**

Key assumptions you have provided to us include:

- The Proposed Obligations will be issued in the form currently represented and pursuant to the financial plan with the base case scenario of the full WRF Surcharge (starting fiscal year 2020) collected as separate line item on the monthly utility bill; and
- Payments to the WRF debt repayment fund secured by net revenues of the water and sewer funds each covenanting to repay their fund's allocated share of debt service.

S&P Global Ratings' analytical judgements include:

- Continued economic growth in the region driven by the tourism and business service sectors, with a nearly built-out community, and a primarily residential and stable customer base;
- Actual operating results will be reasonably in line with management prepared financial plan provided July 2, 2018. We understand that the projections in the financial plan for both the water and sewer funds were based on the Issuer's planning documents and may be conservative due in part to the assumption that the Issuer does not receive any long-term SRF loan financing (in excess of the \$10.3 million SRF Planning Loan already awarded);
- Possible rate increases designed to meet future operating & capital programs and the WRF project debt financing requirements;
- As the Issuer progresses through the WRF project, we note the potential risk of delays in project construction, environmental impacts, and other administrative hurdles. Although the WIFIA loan agreement will likely include project-specific events of default, such as project abandonment and cessation of operations, we consider each of the identified events to be unlikely and remote, given the regulatory driven nature of the project and its strategic importance to the Issuer.

## **Outlook**

*The stable outlook reflects our anticipation that the utility systems will maintain a good-to-strong financial position, which is characterized by its projected good all-in coverage and liquidity margins, as it progresses through the funding and construction of a new WRF project. While we understand the utility systems will likely use cash reserves for supplementing the WRF funding needs, we expect that liquidity will dip slightly but at levels we view as at least strong. We anticipate that the Issuer will approve the new rate plan with the supplemental WRF Surcharges providing greater revenue stability in the near future. We could consider changing the rating in the future based on any change in the credit quality of either utility systems.*

### *Upside scenario*

*We could raise the rating if the utility systems consistently demonstrates a track record of outperforming projections in the financial plan, represented by stronger all-in coverage and liquidity metrics, and if the service area economy materially strengthens.*

### *Downside scenario*

*If all-in coverage fails to meet management's projections as represented in the financial plan with potential pressures of additional capital needs and leverage that could likely cause a weakening in the financial profile of the utility systems, we could lower the rating. Additionally, if rate affordability pressures constrain management's flexibility to make timely rate adjustments, we could revise the rating downward.*

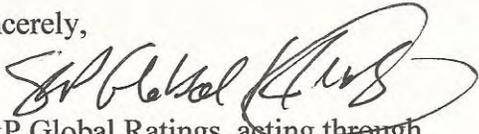

*This evaluation is both preliminary and confidential. It is preliminary in that it is based on hypothetical information presented to us by you. You understand that S&P Global Ratings will not review, modify or surveil this evaluation. Subsequent information or changes to the information previously provided could result in final conclusions that differ from the preliminary proposed conclusions. Please note the conclusions provided herein are based on assumptions you and your team have provided to us. To the extent that these assumptions, our criteria or other factors change, the rating implications could also change. You understand and agree that we are not financial advisors to you and that in performing the RES, S&P Global Ratings is providing indicative rating opinions on the scenarios presented; it is not endorsing or advocating any particular course of action. Nothing in this report is intended to create, or should be construed as creating, a fiduciary relationship between you and us and recipients of the indicative rating opinions. We have not consented to and will not consent to being named an "expert" under applicable securities laws. Neither S&P Global Ratings' RES or any indicative rating set out herein is a credit rating, nor is it a recommendation to buy, hold or sell any financial obligation of an issuer. This letter is subject to the Terms and Conditions attached to the Engagement Letter applicable to the RES (the "applicable T&Cs").*

*Confidential Dissemination of the Evaluation. The evaluation, including this letter, is provided by S&P Global Ratings to you on a confidential basis. You may not disclose the evaluation (or for the avoidance of doubt, any indicative rating set out therein) or this letter, to third parties except: (i) as required by law or regulation, or for regulatory purposes, or (ii) to third parties*

*that are bound by confidentiality obligations; and in each case, only in accordance with law and in its entirety without any changes (and provided a copy of the applicable T&Cs are attached thereto). If the evaluation is disclosed other than in accordance with the Engagement Letter, including the applicable T&Cs, S&P Global Ratings reserves the right to publicly comment on the evaluation and/or publish this letter.*

## EXHIBIT XIII. PROPOSED TERMS AND CONDITIONS FOR WIFIA ASSISTANCE

The proposed terms are outlined in a brief statement attached as **Exhibit XIII**.

**Exhibit XIII**  
**City of Morro Bay**  
**Proposed WIFIA Financing Terms**

**Purpose:** The City is seeking WIFIA financing to help fund a new Water Reclamation Facility (WRF) Project. The WRF Project includes a new wastewater treatment plant, wastewater pumping facilities and a force main to convey wastewater to the new treatment plant, and recycled water facilities to facilitate potable reuse.

**Amount:** The City is seeking WIFIA financing for up to 49% of the total WRF Project cost. Based on a total project cost of \$126 million, the City is seeking approximately \$61,740,000 of project funding. Accounting for accrued interest and issuance-related costs, the amount of WIFIA funding requested totals roughly \$69,500,000.

**Origination Date:** The City anticipates needing WIFIA funding as early as July 1, 2019. The City was previously awarded a \$10.3 million SRF Planning Loan that it anticipates using to fund major design costs in fiscal year 2018/19. The WIFIA financing would be needed to help fund construction which is projected to start in fiscal year 2019/20. Note that the City's fiscal year starts July 1 and ends June 30 of each year.

**Timing of Disbursements:** The City anticipates drawing down the WIFIA financing over 3 years during the construction phase of the project, from fiscal year 2019/20 through fiscal year 2021/22. A rough estimate of potential WIFIA drawdown is as follows:

| <u>Fiscal Year</u> | <u>2019/20</u> | <u>2020/21</u> | <u>2021/22</u> |
|--------------------|----------------|----------------|----------------|
| Drawdown           | \$25,000,000   | \$25,000,000   | \$11,740,000   |

**Repayment Term & Final Maturity:** 35-year repayment term with the first debt service payment due fiscal year 2022/23 (e.g. February 1, 2023) , the year after the project is complete, and the final debt service payment due fiscal year 2057/58 (e.g. February 1, 2058).

**Debt Structure:** Roughly level annual debt service with the potential for partially reduced debt payments during the first approximately 8 years if needed to structure around repayment of a 10-year \$10.3 million State Revolving Fund (SRF) Planning Loan.

**Estimated Interest Rate:** Assuming 3.25% (current rate as of 07/05/18 is approximately 2.95%).

**Pledged Security:** The City anticipates that the WIFIA financing agreement would be directly secured by a senior/parity lien on the revenues of a new WRF Debt Service Fund. Payments to this fund would in turn be secured by the net revenues of the water and sewer funds with each fund covenanting to repay their allocated share of WIFIA debt service. Additionally, the water and sewer utilities would each covenant to raise rates and charges as needed to yield net revenues (generally defined as total revenues less operating and maintenance expenses) that are at least 120% of the annual debt service allocated to each utility each year.

**Repayment Sources:** The City plans to repay the debt with funds generated from water and sewer rates and the City's proposed water and sewer Water Reclamation Facility rate surcharges. The sewer utility's allocated share of debt service would be repaid by revenues from the City's proposed WRF Sewer Surcharges as well as from the City's regular sewer rate revenues. Likewise, the water utility's allocated share of debt service would be repaid by revenues from the City's proposed WRF Water Surcharges as well as from the City's regular water rate revenues.

**Lien Position: Senior lien** -- The WIFIA financing agreement would have a senior/parity lien on the revenues of the proposed new WRF Debt Service Fund. In turn, the sewer fund's payments to the WRF Debt Service Fund for the sewer utility's share of debt service would be secured by a senior/parity lien on the net revenues of the sewer enterprise. And similarly, the water fund's payments to the WRF Debt Service Fund for the water utility's share of debt service would be secured by a senior/parity lien on the net revenues of the water enterprise.

**Estimated Sources & Uses of Funds & Draft Debt Service Schedule:** The following tables show 1) estimated sources and uses of funds assuming WIFIA financing for 49% of a total \$126 million project cost, and 2) a draft debt service schedule assuming level annual debt service.

Table 1  
 City of Morro Bay  
 Estimated WIFIA Sources & Uses of Funds

|                                                                                                                                                         |                                  |                   |

## EXHIBIT XIV. RATE STUDIES AND RATE SCHEDULES

The City of Morro Bay is currently in the process of adopting new water and sewer rates. The City expects the rates to be adopted in late Summer 2018. The final rate studies and schedules will be submitted prior to the obligation of the loan. **Exhibit XIV** includes Resolution No 44-18 to guide the Proposition 218 Process; the 2015 Rate Study; and the Draft 2018 Rate Study.

**RESOLUTION NO. 44-18**

**RESOLUTION OF THE CITY COUNCIL OF THE CITY OF MORRO BAY, CALIFORNIA,  
APPROVING GUIDELINES FOR THE SUBMISSION AND TABULATION OF  
PROTESTS IN CONNECTION WITH RATE HEARINGS CONDUCTED PURSUANT TO  
ARTICLE XIID, SECTION 6 OF THE CALIFORNIA CONSTITUTION**

**THE CITY COUNCIL  
City of Morro Bay, California**

**WHEREAS**, Article XIID, Section 6 of the California Constitution requires the City Council to consider written protests to certain proposed increases to rates (fees or charges) for sewer (wastewater), water or refuse collection services; and

**WHEREAS**, that constitutional provision does not offer specific guidance as to who may submit protests, how written protests are to be submitted, or how the City is to tabulate protests.

**WHEREAS**, upon adoption of this resolution, any and all resolutions, rules or regulations of the City in conflict with it, shall be rescinded and of no further force or effect. This resolution supersedes all prior resolutions, rules or regulations of the City to the extent any or all of them established guidelines for the submission and tabulation of protests in connection with rate hearings conducted by the City pursuant to Article XIID, Section 6 of the California Constitution.

**NOW, THEREFORE, BE IT RESOLVED** by the City Council of the City of Morro Bay, California, as follows:

**SECTION 1: Definitions.**

Unless the context plainly indicates another meaning was intended, the following definitions shall apply in construction of these guidelines.

- A. "Parcel" means a San Luis Obispo County (County) Assessor's parcel the record owner or occupant of which is subject to the proposed rate that is the subject of the hearing.
- B. "Record customer" and "customer of record" mean the person or persons whose name or names appear on the City records as the customer who has contracted for, or is obligated to pay for, wastewater, water or refuse collection services to a particular utility account.
- C. "Record owner" or "parcel owner" means the person or persons whose name or names appear on the County Assessor's latest equalized assessment roll as the owner of a parcel.
- D. "Rate" means a fee or charge as understood by Article XIID, Section 6 of the California Constitution.

- E. A "rate protest proceeding" is not an election, but the City Clerk will maintain the confidentiality of protests as provided below and will maintain the security and integrity of protests at all times.

**SECTION 2: Notice.**

Notice of proposed rates and public hearing shall be as follows:

A. Notice Content.

1. Amount of rate proposed to be imposed on each parcel.
2. Basis upon which the amount of the proposed rate was calculated.
3. Reason for the rate.
4. The date, time, and location of a public hearing on the proposed rate.
5. If a combined public hearing is held for more than one proposed rate, then a combined notice for the combined public hearing must indicate an explanation any statement and protest shall clearly indicate which proposed change(s) is/are being protested.

B. Notice Delivery and Posting.

1. The City shall give notice of proposed rates via U.S. mail to all record owners and customers of record served by the City no less than 45 days before the public hearing upon the proposed rate.
2. The City will post the notice of proposed rates and public hearing at its official posting sites no less than 45 days before the public hearing upon the proposed rate.

**SECTION 3: Protest Submittal.**

- A. Any record owner or customer of record who is subject to the proposed utility rate that is the subject of the hearing who wants to protest the rate must submit a written protest to the City Clerk, by:

1. Delivery, to the City Clerk's Office at 595 Harbor Street, Morro Bay, CA 93442, during published business hours,
2. Mail to the City Clerk at 595 Harbor Street, Morro Bay, CA 93442, or
3. Submittal to the City Clerk at the public hearing for the rate increase.

- B. If more than one protest is delivered, mailed or submitted in one envelope or at one time, then at least one of the protests contained in that envelope or concurrently delivered, mailed or submitted shall be signed by the person delivering, mailing or submitting those protests.

- C. Each protest must be received by the end of the public hearing, including those mailed to the City. No postmarks will be accepted for proof of meeting the submission deadline; therefore, any protest not physically received by the close of the hearing, whether or not mailed prior to the hearing, shall not be counted.
- D. Because an original signature is required, emailed, faxed and photocopied protests shall not be counted.
- E. Although oral comments at the public hearing will not qualify as a formal protest, unless accompanied by a written protest, the City Council welcomes input from the community during the public hearing on the proposed rate.

**SECTION 4: Protest Requirements.**

- A. A written protest must include all the information described in subparagraphs 1. through 6., below.
  - 1. A statement it is a protest against the proposed rate that is the subject of the hearing. If a combined public hearing is held for more than one proposed change, then the statement and protest must clearly indicate which proposed change is being protested. The combined notice for the combined public hearing must indicate that as well. The protests for more than one proposed change from the same record owner or customer of record may be combined on one protest document,
  - 2. Name of the record owner or customer of record who is submitting the protest,
  - 3. Identification of assessor's parcel number, street address, or utility account number for the parcel with respect to which the protest is made,
  - 4. Original signature of the named record owner or customer of record and date the protest was signed,
  - 5. To be sure all pertinent information is provided and considered prior to a protest being filed, no protest shall be signed before the City has issued the formal notice that commences the 45-day protest period and
  - 6. A certification, by the named record owner or customer of record, as applicable, affirming the contents of the protest are true and correct.
- B. A protest shall not be counted if any of the required elements of this Section 4 are omitted.
- C. A protest must either be submitted on the ballot included with the notice of the protest period, or a ballot that includes all the information required by this Resolution.

**SECTION 5: Protest Withdrawal or Change.**

- A. **Withdrawal of Protest.** Any person who submits a protest may withdraw it by submitting to the City Clerk a written request the protest be withdrawn. The withdrawal of a protest shall contain sufficient information to identify the affected parcel and the name of the record owner or customer of record who submitted both the protest and the request it be withdrawn.

- B. Change to Protest. Any person who submits a protest may change it by submitting to the City Clerk a written request the protest be changed, and then either request another protest ballot and return the new protest ballot pursuant to the procedures provided herein, or submit a protest ballot that includes all the information required by this Resolution with the changes desired. The changed protest shall contain sufficient information to identify the affected parcel and the name of the record owner or customer of record who submitted both the protest and the request it be changed.

**SECTION 6: Multiple Record Owners or Customers of Record.**

- A. Each record owner or customer of record of a parcel served by the City may submit a protest. That includes when:
1. The fee interest in a parcel is owned by more than one record owner,
  2. More than one name appears on the City's records as the customer of record for a parcel,
  3. A customer of record is not the record owner,
  4. A parcel includes more than one customer of record, or
  5. Multiple parcels are served via a single utility account, as master-metered common interest developments.
- B. Only one protest will be counted per parcel as provided by Government Code subdivision 53755(b).

**SECTION 7: Transparency, Confidentiality, and Disclosure.**

- A. To ensure transparency and accountability in the fee protest tabulation, while protecting the privacy rights of record owners and customers of record, protests will be maintained in confidence until tabulation begins following the close of the public hearing.
- B. Once a protest is opened during the tabulation, it becomes a disclosable public record, as required by state law; and each original protest (or electronic copy) will be maintained in City files for two years.

**SECTION 8: City Clerk.**

The City Clerk shall not accept as valid any protest if she/he determines any of the following is true:

- A. The protest does not conform to any of the requirements of this Resolution or:
1. The protest does not bear original signatures of the named record owner of, or customer of record with respect to, the parcel identified on the protest. Whether a signature is valid shall be entrusted to the reasonable judgment of the City Clerk, who may consult signatures on file with County Officials or other appropriate public agencies,

2. The protest was altered in a way that raises a fair question as to whether the protest actually expresses the intent of a record owner or a customer of record to protest the rates or
  3. The protest was not received by the City Clerk before the close of the public hearing on the proposed rates.
- B. A request to withdraw or change the protest, pursuant to Section 5, above, was received prior to the close of the public hearing on the proposed rates.

**SECTION 9: City Clerk's Decisions Final.**

The City Clerk's decision a protest is not valid shall constitute a final action of the City and shall not be subject to any internal appeal.

**SECTION 10: Majority Protest.**

- A. A majority protest exists if written protests that comply with the requirements herein are timely submitted, and not withdrawn or changed, by the record owners of, or by the customers of record with respect to, a majority (50% plus one) of the parcels subject to the proposed charge.
- B. While the City may inform the public of the number of parcels and customers of record served by the City when a notice of proposed rates is mailed, the number of parcels with active customer accounts served by the City on the date of the hearing shall control in determining whether a majority protest exists.

**SECTION 11: Tabulation of Protests.**

At the conclusion of the public hearing, the City Clerk shall tabulate all valid protests received, including those received prior to the conclusion of the public hearing, and shall report the result to the City Council. If the number of protests received is insufficient to constitute a majority protest, then the City Clerk may determine the absence of a majority protest without validating the protests received, but may instead deem them all valid without further examination. Further, if the number of protests received is obviously substantially fewer than the number required to constitute a majority protest, then the City Clerk may determine the absence of a majority protest without opening the envelopes which contain the protests.

**SECTION 12: Report of Tabulation.**

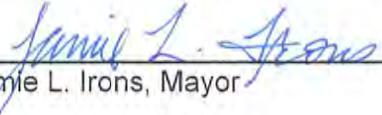

If, at the conclusion of the public hearing, the City Clerk determines she/he will require additional time to validate and tabulate the protests because she/he has not made the determination described in Section 11, above, then she/he shall so advise the City Council, which may continue the related portion of the meeting to allow the validation and tabulation to be completed on another day or days. If so, then the City Council shall declare the time and place of tabulation, which shall be conducted in a place where interested members of the public may observe the tabulation, and the City Council shall

declare the time at which the meeting shall be continued to receive and act on the tabulation report of the City Clerk.

**SECTION 13:** This resolution will become effective immediately upon adoption.

**PASSED AND ADOPTED** by the City Council of the City of Morro Bay at a special meeting thereof held on the 13<sup>th</sup> day of June, 2018 on the following vote:

AYES: Irons, Davis, Headding, Makowetski, McPherson  
NOES: None  
ABSENT: None

## Water & Sewer Rate Study Key Issues

---

### 1. BACKGROUND & OBJECTIVES

#### Background

The City of Morro Bay is located on the Central California coast in San Luis Obispo County, about 12 miles northwest of the City of San Luis Obispo. The City has a population of approximately 10,300. The City was incorporated in 1964 and is governed by a 5-member City Council. Council Members are elected at-large from the community for 4-year terms on alternating even years.

The City provides water and wastewater services to its residents. Both water and sewer utilities are facing major financial challenges in upcoming years that will require substantial rate increases.

- Water rates have not been increased in almost 20 years and the water utility is operating in deficit mode with an anticipated budget deficit of over \$900,000 in the current fiscal year. Additionally, the City needs to fund a number of near-term water system capital improvements to address deficiencies and improve reliability, and faces long-term challenges regarding its water supply.
- The biggest challenge facing the sewer enterprise is the requirement to build a new wastewater treatment plant at an estimated cost of almost \$75 million over the next four to five years. Additional funding is needed for repair and rehabilitation of various components of the City's aging sewer collection system.

BWA met with the City's Public Works Advisory Board on January 29, 2015 and February 19, 2015 to present preliminary finding and recommendations and receive input. The draft water and sewer rate recommendations presented in this report incorporate input received from the Public Works Advisory Board. The Public Works Advisory Board opted to make no formal recommendations regarding various other related issues such as an additional surcharge for desalination facility use, emergency water shortage rates, or an automatic pass-through for State Water Contract costs. However, the Public Works Advisory Board expressed support for some form of a low-income discount to help mitigate the impact on economically disadvantaged customers.

## **Financial Plan & Rate Study Objectives**

In 2014, Bartle Wells Associates (BWA) was retained to develop water and sewer rate studies and update various water and sewer charges. Key objectives of the rate studies are to recommend water and sewer service charges that are adequate to fund future operating and capital needs of each utility. Key elements of the rate study include

1. Develop 10-year water and sewer enterprise financial projections to determine annual revenue requirements
2. Incorporate the latest available financial information and estimates of future operating and capital funding needs
3. Evaluate financing alternatives for the City's water and wastewater capital improvement programs including construction of a new Water Reclamation Plant.
4. Develop water and sewer rates that:
  - a. Recover the City's costs of providing water and sewer service and support the long-term financial stability of the water and sewer utilities
  - b. Provide adequate funding for capital needs including long-term infrastructure repairs and replacements
  - c. Are fair, equitable, and politically acceptable
  - d. Comply with the legal requirements of Proposition 218
5. Aim for gradual annual rate increases, to the extent possible, to help minimize the annual impact on customers
6. Pursue low-cost financing alternatives for required debt financing
7. Maintain a prudent level of fund reserves

## **Constitutional Requirements for Water & Sewer Rates**

The California Constitution includes two key articles applicable to water and sewer rates: Article 10 and Article 13D. The rates developed in this study were designed to comply with both of these constitutional mandates as well as various provisions of the California Water Code and Government Code that support and add further guidance for implementing these constitutional requirements. In accordance with the constitutional provisions, the proposed rates are designed to a) recover the City's cost of providing service, b) recover revenues in reasonable proportion to the cost for serving each customer, and c) promote conservation and discourage waste.

**Article 10, Section 2** – This section was established by voter-approval in 1976 and requires public agencies to maximize the beneficial use of water, prevent waste, and encourage conservation. Section 2 states that:

*“It is hereby declared that because of the conditions prevailing in this State the general welfare requires that the water resources of the State be put to beneficial use to the fullest extent of which they are capable, and that the waste or unreasonable use or unreasonable method of use of water be prevented, and that the conservation of such waters is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and for the public welfare.”*

**Article 13D, Section 6** - Proposition 218 was adopted by California voters in 1996 and added Articles 13C and 13D to the California Constitution. Article 13D, Section 6 governs property-related charges, which the California Supreme Court subsequently ruled includes ongoing utility service charges such as water, sewer, and garbage rates. This section establishes a) procedural requirements for imposing or increasing property-related charges, and b) substantive requirements for those charges. Article 13D also requires voter approval for new or increased property-related charges but exempts water, sewer, and garbage rates from the voting requirement provided the rates comply with the section’s cost of service requirements.

The substantive rate requirements of Article 13D, Section 6 include:

1. Revenues derived from the fee or charge shall not exceed the funds required to provide the property related service.
2. Revenues derived from the fee or charge shall not be used for any purpose other than that for which the fee or charge was imposed.
3. The amount of a fee or charge imposed upon any parcel or person as an incident of property ownership shall not exceed the proportional cost of the service attributable to the parcel.
4. No fee or charge may be imposed for a service unless that service is actually used by, or immediately available to, the owner of the property in question.

A subsequent appellate court decision in 2015 further clarified that agencies must demonstrate, satisfactory to a court’s independent judgment, that property-related fees and charges meet the proportionality requirement of Section 6.(3). This rate study provides that justification. The water and sewer rates derived in this report are each based on a cost-of-service methodology that fairly apportions costs to all customers.

## 2. WATER FINANCIAL PLAN & RATE STUDY

### Water Finances & Rates

- The City's water utility is a financially self-supporting enterprise.
  - Water rates are the main source of revenues and currently account for approximately 98% of total revenues.
  - Water rates should be set at levels adequate to fund the cost of providing service, including long-term operating and capital needs, and support the enterprise's long-term financial stability.
- Water rates were last increased in 1995 and have not been adjusted in almost 20 years. Adjusted for inflation, water rates are about 36% lower than they were in 1995. With hypothetical 3% annual rate escalation since 1995, the City's water rates would now be approximately 75% higher than they currently are.
- The water enterprise is now operating in deficit mode with a projected budget deficit of over \$900,000 in the current fiscal year.
- The City is out of compliance with debt service coverage covenants related to its share of payments for the Central Coast Water Authority's Series 2006A Revenue Bonds. The City has legally covenanted to raise water rates and charges as needed to generate Net Revenues – revenues remaining after funding the City's water operating expenses -- adequate to fund 125% of the City's total state water contract payments, including the bond payments and other contractual funding requirements payable to the San Luis Obispo County Flood Control and Water Conservation District, the local State Water Contractor.
- The water enterprise had approximately \$2.6 million in reserves as of June 30, 2014. However, the City anticipates drawing down fund reserves during the current fiscal year, to levels slightly below prudent minimum targets.
- The monthly water bill for a typical single family home using 6 hundred cubic feet (hcf) of water per month, equal to a little under 150 gallons per day (gpd), is \$33.20 or slightly over \$1 per day. The City's typical residential water bills are in the lower-middle range compared to other regional agencies and were the fourth lowest of 12 agencies surveyed.
- The City's current water rates include both a fixed monthly charge of \$16.43 plus water quantity charges that gradually escalate from \$5.56 for the fourth unit of metered water use per month to \$13.68. The first three units of water are provided with the fixed charge, at no additional cost. All customer pays according to the same rate schedule.

## Financial Challenges

The City's water enterprise faces a number of financial challenges in upcoming years that are putting upward pressure on rates. Key challenges include:

### ➤ **Eliminate Budget Deficits and Restore Financial Stability**

- With almost 20 years of no rate increases, the water enterprise has been slowly starved of funds resulting in current budget deficits. The budget deficit for the current fiscal year is projected at over \$900,000. Rate increase are needed to restore financial stability and eliminate annual deficits.

### ➤ **Repair & Replacement of Aging Facilities**

- The City's water system capital improvement program identifies approximately \$9 million (current \$) of funding needs over the next 10 years, including \$6 million (current \$) of capital needs over the upcoming five years. Accounting for 3% construction cost inflation, capital improvements are projected to total approximately \$10 million over the next decade. Projects include adding storage for fire flow and reliability, repairing and improving the City's water desalination facility, and repairing/replacing aging and substandard water distribution pipelines. Many of the City's pipelines are over 50 years old and are approaching the end of their useful lives.

### ➤ **Long-Term Water Supply**

- A large portion the City's water supply comes from the State Water Project. The City's 2014/15 budget includes a little over \$2.2 million for costs related to the State Water Project. This equates to over 55% of annual operating expenses and roughly half of total annual expenditures.
- State Water Project costs are expected to increase substantially in future years due to implementation of the Bay Delta Conservation Plan, a 50-year plan to restore the Sacramento-San Joaquin Delta ecosystem and secure future water supply through the State Water Project and Central Valley Project. The plan includes construction of roughly 30-miles of water conveyance pipelines to enable source water to circumvent the Delta. Costs are estimated at roughly \$25 billion over the next 50 years with costs front-loaded over the next decade.
- Planned construction of a new "reclamation ready" wastewater treatment plant will enable the City to pursue a future recycled water project that could ultimately support the long-term reliability and sustainability of the City's water supply. Based on very preliminary engineering cost estimates, the recycled water system is projected to cost

roughly \$25 million (future \$) starting in about six years in 2020/21. When constructed, the City would also need to pay additional operating costs for recycled water operations. However, recycled water may enable the City to reduce reliance the State Water Project and thus replace imported water with a potentially lower-cost local source of supply.

- The City will continue to evaluate water supply alternatives with the goals of securing a reliable and cost-effective source of water supply to meet the City's long-term supply needs.

#### ➤ **Reduced Water Sales**

- Water sales have decreased in recent years. Average annual water sales from the past three fiscal years are about 7% lower than the average from the prior three years. Additional reductions in water sales are anticipated due to customer response to projected substantial rate increases.
- Reduced levels of water use result in a reduction of water sales revenues, which in turn puts upward pressure on water rates. However, customers who conserve will end up purchasing fewer units of water which helps mitigate the impact of higher unit charges.

#### ➤ **Operating Cost Inflation**

- Annual rate increases are needed to keep revenues in line with ongoing operating cost inflation. Cost inflation for water & wastewater utilities (whose costs are largely related to labor and capital) has historically been higher than CPI, which is more of a measure of urban goods and services.

### **Financial Projections**

- BWA developed 10-year financial projections to evaluate annual revenue requirements and project water rate increases. The projections were based on reasonable and slightly conservative assumptions including:
  - Operating cost projections are based on the 2014/15 Budget
  - Operating cost inflation is projected at 4% per year for planning purposes
  - The projections assume a relatively low growth scenario of 10 new single family homes or equivalent units per year
  - To account for customer response to rate increases, water sales projections account for elasticity estimated at -0.15; each 10% increase in rates results in a 1.5% decrease in water sales.

- Includes funding for the water system capital improvement program with 3% construction cost inflation. Due to the extent of near-term funding needs, the projections assumes the City issues debt to finance \$3.5 million of capital improvement projects in 2015/16. BWA recommends the City pursue a subsidized loan from the California Infrastructure and Economic Development Bank, commonly known as the “I-Bank”, for these funding needs.
- Assumes the City funds a future \$25 million recycled water project using a Clean Water State Revolving Fund (SRF) loan. The SRF financing program currently offers 20 or 30-year loans with interest rates below 2%. For planning purposes, the projections assume a 30-year SRF loan with a 3% annual interest rate.
- Includes new operating costs for the recycled water system projected at \$300,000 (escalated \$) starting 2022/23.
- A minimum fund reserve target for planning purposes is recommended at 25% of annual operating expenses, plus \$1 million for emergency capital reserves. It is acceptable for reserves to temporarily drop below these levels provided the City has taken action to achieve the targets over the longer run.

### **Draft Rate Projections**

- Cash flow projections indicate the need for substantial water rate increases over the next five years. Due to the level of current budget deficits coupled with near-term financial needs, a larger initial rate increase is needed in 2015/16, with smaller increases in future years.
- Deferring or reducing necessary rate increases in the near-term would result in the need for higher rate increases in future years (and vice versa)
- With the proposed rate increases, the City’s water rate are expected to end up in the middle to upper-middle range compared to other regional agencies. A number of other regional agencies are also anticipating water rate increases in upcoming years.
- For a typical single family home using 6 hcf of water per month, the maximum proposed rates for the next five years will equal the City’s 1995 rate escalated at the annual rate of approximately 3.5% through 2019/20.
- The financial projections indicate the need for additional gradual rate increases after the next five years to provide adequate repayment capacity for a future SRF loan anticipated for a future recycled water project. Small future annual rate adjustments are recommended keep revenues in line with operating cost inflation and help minimize the potential for future rate spikes.

## Water Rate Structure

- All water customers currently pay both a fixed monthly charge of \$16.43 plus water quantity charges that gradually escalate from \$5.56 starting with the fourth unit of metered water use per month to \$13.68. The first three units of water are provided with the fixed charge, at no additional cost. The fixed charge is roughly equal to the City's lowest rate per unit of water applied to the first three units of unbilled water.
- Under the current rate structure, low-use customers and second homes benefit from both a) fixed charges that are disproportionately low compared to fixed expenses, and b) no charges for the first three units of monthly water use. Over 35% of annual bills are for three units of water or less.
- BWA developed updated water rates with the following modifications to the rate structure:
  - Water quantity charges are phased in for the first three units of water.
  - Fixed monthly charges continue to recover approximately one-third of total rate revenues. While the fixed charges are disproportionately low compared to the City's fixed expenses, this level of fixed revenue recovery is in line with industry norms and conservation-oriented rates (e.g. the California Urban Water Conservation Council has historically recommended agencies' fixed charges recover 30% or less of total rate revenues, but also recognizes that some agencies legitimately have a higher percentage of rate revenues recovered from fixed charges to better ensure revenue stability).
  - Proposed water quantity rates transition to a four-tiered inclining rate structure. Under the draft proposed rate structure, customers would first purchase water in the lowest tier before purchasing water in successive higher tiers as use increases. Due to a transition in rate structure, billing impacts will vary based on water use.
- The rate structure modifications represent incremental modifications to the City's existing rate structure, not a complete revision.

## Cost Recovery & Rate Derivation

- The California Constitution does not give agencies leeway to arbitrarily set rates purely based on policy preferences. Rather, it provides agencies with flexibility to implement rates within a framework established by Articles 10 and 13D. Together, these Articles establish that rates should both a) discourage waste and encourage conservation of water, and b) not exceed the costs of service attributable to each parcel or customer.
- In reality, many costs can be reasonably attributed to components of an agency's rate structure based on a range of approaches. For example, costs for an agency's conservation

program can reasonably be attributed and recovered via many approaches including from a) both fixed and variable charges, b) 100% from variable charges, c) on a pro-rata basis from all volumetric tiers, or d) from higher volumetric rate tiers. Likewise, costs for salaries, debt service, and capital improvements can reasonably be treated as a) fixed annual costs that should be recovered from fixed charges, b) costs related to providing water supply and system capacity to meet customer demand and therefore costs that should be recovered from variable rates based on each customer's share of actual water use, or c) costs that can be recovered by both fixed and variable rates, a middle-road approach. Furthermore, costs attributable to meeting peak demands can reasonably be allocated a) to all volumetric tiers on a pro-rata basis, or b) more to higher tiers in recognition that higher tier water use accounts for a disproportionately higher share of demand during peak use months and are the underlying driver of the need for sizing facilities to meet peak demands.

- Ultimately, there is no single correct way to allocate or attribute costs; rather there are a range of reasonable approaches. Hence, five similar agencies may have five different rate structures provided each agency establishes a reasonable cost basis for their own particular rate structure within the parameters of meeting the various requirements of the California Constitution.
- While there is no single correct approach for cost attribution and rate-setting, BWA believes that costs should be allocated within a reasonable range that reflects both a) underlying cost causation, to the extent such causation can reasonably be determined or estimated, and b) the policy preferences of the agency within the parameters of having a reasonable cost basis. The rates developed in this report are designed to achieve the City's policy preferences while complying with the requirements of the California Constitution.
- A detailed cost recovery allocation was developed supporting the proposed rates for fiscal year 2019/20. Rates in intervening years are phased in from current levels to the proposed levels calculated for 2019/20, in order to help minimize the annual impact due to rate structure modifications occurring in addition to overall rate increases.
- The proposed rates were developed based on reasonable and equitable allocations for cost recovery from the City's fixed charges and tiered quantity charges. Based on the allocations, fixed monthly service charges will recover approximately 34% of total rate revenues and water quantity charges will recover roughly 66% of total rate revenues.

- The roughly 66% of costs designated for recovery from the City’s water quantity charges are further allocated for recovery from each rate tier based on the following assumptions:
  - Costs attributable to all water use are allocated on a pro-rata basis to all water use. This results in each rate tier recovering a pro-rata share of costs based on the percentage of water consumed in each tier.
  - Costs related to meeting peak demands are allocated more toward higher tiers in recognition that higher tier water use accounts for a disproportionately higher share of demand during peak use months and therefore is the underlying driver of the need for sizing facilities to meet peak demands. Costs attributable to peak demand are attributed to 15% of Tier 2 water use, 35% of Tier 3 water use, and 60% of Tier 4 water use. No peak costs are allocated for cost recovery from Tier 1.
  - Many costs – such as costs for operating and maintaining facilities – are incurred providing service to meet both average demands and peak demands. The share of these costs allocated for variable revenue recovery are further allocated two-thirds to all water use and one-third to meeting peak demand
  - In total, costs are recovered as follows:
    - Fixed rate cost recovery: 34%
    - Variable rate cost recovery : 66%, of which costs are recovered
      - Pro-rata allocation to all water use: 47.4%
      - Allocation to peak use: 18.7%

## **Proposed Water Rates & Impacts**

- The following table shows a schedule of proposed water rates for the next 5 years. Charges include both a) a fixed monthly charge billed regardless of water use, and b) water quantity charges billed in 4 inclining tiers with water first purchased in Tier 1 and subsequently higher tiers as water use increases.

### Proposed Water Rates

|                                                     |            | Current      | Projected Water Rates |         |         |         |         |
|-----------------------------------------------------|------------|--------------|-----------------------|---------|---------|---------|---------|
|                                                     |            |              | 2015/16               | 2016/17 | 2017/18 | 2018/19 | 2019/20 |
| <b>Fixed Monthly Charge</b>                         |            | \$16.43      | \$23.00               | \$26.00 | \$28.00 | \$30.00 | \$32.00 |
| <b>Water Quantity Charges (\$/hcf)</b>              |            |              |                       |         |         |         |         |
| Tier 1                                              | 0 - 3 hcf  | \$0.00       | \$3.00                | \$4.00  | \$5.00  | \$5.50  | \$6.00  |
| Tier 2                                              | 4 - 10 hcf | 5.56 - 5.74  | 6.00                  | 7.00    | 7.50    | 8.00    | 8.50    |
| Tier 3                                              | 11- 50 hcf | 5.77 - 7.81  | 9.00                  | 9.50    | 10.00   | 10.50   | 11.00   |
| Tier 4                                              | >50 hcf    | 7.85 - 13.68 | 12.00                 | 12.50   | 13.00   | 13.50   | 14.00   |
| <i>1 hcf = one hundred cubic feet = 748 gallons</i> |            |              |                       |         |         |         |         |

- The following table projects monthly water bills at different levels of water use. Due to the phase-in of charges for the first 3 units of water, low-use customers will experience a higher percentage increase but lower dollar increase in their monthly bills. Under the proposed rates, low use customers will still benefit from low fixed monthly charges and water purchases in the lowest rate tiers.

### Water Rate Impacts

| Monthly Use (hcf) | Current  | Projected Monthly Bills |          |          |          |          | 5-Year Impact |        |
|-------------------|----------|-------------------------|----------|----------|----------|----------|---------------|--------|
|                   | \$/Month | 2015/16                 | 2016/17  | 2017/18  | 2018/19  | 2019/20  | \$/month      | \$/day |
| 0                 | \$16.43  | \$23.00                 | \$26.00  | \$28.00  | \$30.00  | \$32.00  | \$15.57       | \$0.51 |
| 1                 | 16.43    | 26.00                   | 30.00    | 33.00    | 35.50    | 38.00    | 21.57         | 0.71   |
| 2                 | 16.43    | 29.00                   | 34.00    | 38.00    | 41.00    | 44.00    | 27.57         | 0.91   |
| 3                 | 16.43    | 32.00                   | 38.00    | 43.00    | 46.50    | 50.00    | 33.57         | 1.10   |
| 4                 | 21.99    | 38.00                   | 45.00    | 50.50    | 54.50    | 58.50    | 36.51         | 1.20   |

| 200               | 1,747.86 | 2,234.00                | 2,342.00 | 2,445.50 | 2,547.50 | 2,649.50 | 901.64        | 29.64  |

- Under the proposed rates, low use customers will continue to benefit from low fixed charges coupled with water consumption in the lowest quantity rate tiers.
- High-use customers will also continue to benefit from low fixed charges, particularly considering the higher levels of demand these customers place on the water system and associated higher levels of capacity needs in water infrastructure. At the same time, the rate structure balances the low fixed charges for high-use customers with inclining rate tiers that recover a higher share of costs from higher levels of use, similar to the City's historical water rate structure.

### **Temporary Surcharge for Desalination Facility Use**

- The City's desalination plant was originally constructed in 1992 to provide water supply during a drought emergency and was subsequently upgraded in 2009. The plant served as the City's primary source of water supply for a few months of 2010 and is currently used on a very limited basis to treat high-nitrate groundwater to supplement supply from the State Water Project. The plant provides a source of backup and emergency water supply in case of future State Water Project supply reductions or service outages. In future years, the plant may potentially be used as a primary source of supply.
- The plant treats water via reverse osmosis to produce high-quality drinking water. The relatively high operating costs for running the plant during potential future water shortage emergencies are not factored into the proposed water rate increases. As such, BWA recommends adoption of a surcharge to recover the plant's operating costs during periods of use. The surcharge would be billed based on a customer's metered water use and would only be levied for periods when the desalination plant is in operation.
- Because the cost of producing potable water can vary substantially depending on the source and quality of the untreated supply (e.g. seawater, brackish water, high-nitrate well water), BWA recommends the City adopt a maximum allowable surcharge via the Proposition 218 process based on the most expensive cost of water production: untreated seawater. This would give the City authorization and flexibility to levy a surcharge up to the maximum allowable level as needed.
- The proposed maximum surcharge is based on the cost of producing drinking water from seawater. These costs would be partially offset by reduced purchases from the State Water Project. A preliminary draft of the maximum surcharge based on treatment of seawater is as estimated as follows:

- Cost of seawater treatment totals approximately \$1,600 per AF or about \$3.70 per hcf. This total would be offset by a) roughly \$45 per AF in variable State Water Project expenses, and b) \$250 per AF of staffing expenses which are not incremental costs, but simply a transfer of existing staffing costs. This results in a total offset of about \$0.70 per hcf and a net maximum surcharge of \$3.00 per AF.
  - For comparison, the total cost of treating brackish water is about \$1,000 per AF, approximately \$600 per AF lower than seawater treatment. The incremental costs for treating brackish water, less applicable offsets, would result in a net surcharge of about \$1.60 per AF.
- The Proposition 218 notice and Resolution adopting the surcharges should allow for automatic annual inflationary adjustments to keep the charge in line with future costs of water treatment, which include substantial costs for electricity and chemicals.

### **Water Shortage Emergency Rates**

- BWA recommends consideration of Water Shortage Emergency Rates designed to help the water enterprise remain financially stable during periods of emergency water shortages and reduced water sales. Water Shortage Emergency Rates can be phased in by future Council authorization in response to the escalating water shortage stages identified in the Water Shortage Contingency Plan of the 2010 UWMP.
- The City is currently in a Stage 3 Water Shortage and has implemented conservation requirements for “Severely Restricted Water Supply Conditions”. More severe water shortage stages could require additional cutbacks in customer demand and result in future revenue shortfalls. As such, the City could adopt Water Shortage Emergency Rates that could be triggered with a Stage 4 or 5 Water Shortage.
- Water Shortage Emergency Rates can be adopted along with regular water rate increases via the Proposition 218 process in order to give the City authority to implement emergency rates when needed. If adopted, the City can opt to phase in emergency rates as needed provided the rates do not exceed the maximum levels noticed and adopted via the Proposition 218 process.
- If ever implemented, Water Shortage Emergency Rates should be gradually phased out as water sales return to normal levels. Emergency Rates should not immediately be rescinded when a water shortage stage is declared over as it typically takes additional time for water sales to return to normal-year levels.
- The City has already taken substantial steps to help ensure adequate water supply during periods of drought. According to the 2010 Urban Water Management Plan (UWMP), “it is

not anticipated that the City will face a chronic shortage condition at which the City would need to implement any additional measures to reduce the demand” other than basic conservation measures outlined in the UWMP. The UWMP only foresees the need for more extreme measures, such as water rationing, during catastrophic interruptions that would reduce water supplies by 50% or more.

### **Automatic Pass-Through for State Water Contract Costs**

- State Water Contract costs currently account for roughly half of annual water enterprise expenses. These costs may increase substantially in future years due to implementation of the \$25 billion Bay Delta Conservation Plan. The timing of the future expenditures and impacts on the City and other recipient of State Water Project water are not currently known. The financial projections incorporated 5% annual cost escalation for State Water Contract expenses. While substantial cost increases may not impact the City until after the next five years, the City can consider adopting an automatic pass-through to account for unanticipated increases in State Water Contract costs above the modest projected increases incorporated in the draft rate projections.
- California Government Code Section 53756 became effective on January 1, 2009 and authorizes public agencies providing water, sewer, and garbage services to adopt automatic pass-through rate adjustments to account for a) cost inflation, and b) increases in wholesale water charges or wastewater treatment charges. Pass-throughs must be adopted via the Proposition 218 process and can be effective for up to five years without additional Proposition 218 authorization. The Proposition 218 Notice informing ratepayers of the proposed pass-throughs must include a clearly defined formula indicating how any inflationary or wholesale adjustments will be implemented. After adoption of a pass-through formula, agencies do not need to go through the Proposition 218 process to implement a pass-through. However, agencies must send ratepayers a notice informing them of the pass-through not less than 30 days before the effective date of the adjustment. Regardless of the pass-through authorization, rates must continue to comply with the substantive provisions of Proposition 218 including that any inflation adjustment cannot exceed the cost of providing service.

### 3. SEWER FINANCIAL PLAN & RATE STUDY

#### Sewer Finances & Rates

- The City's sewer utility is a financially self-supporting enterprise.
  - Sewer rates are the main source of revenues and currently account for approximately 98% of total revenues.
  - Sewer rates should be set at levels adequate to fund the cost of providing service, including long-term operating and capital needs, and support the enterprise's long-term financial stability.
- The City has gradually increased sewer rates every year since at least 1998. Since 2008, the City has adopted 5% annual rate adjustments each year. These rate increases have supported the financial stability of the sewer utility and put the enterprise in decent financial position to address its financial challenges with substantial, but gradual, rate increases.
- The sewer enterprise had approximately \$3.1million in reserves as of June 30, 2014. However, the City anticipates drawing down over \$1 million of fund reserves during the current fiscal year on preliminary costs related to the new Water Reclamation Facility. The City anticipates that these costs will be reimbursed by future SRF financing.
- The monthly sewer bill for a typical single family home is \$45.59 or slightly over \$1.50 per day. The City's residential sewer bills are in the middle range compared to other regional agencies.

#### Financial Challenges

The City's sewer enterprise faces a number of financial challenges in upcoming years that are putting upward pressure on rates. Key challenges include:

- **Funding a New \$75 Million Water Reclamation Facility**
  - Based on engineering and financial evaluation of key alternatives, the City anticipates moving forward with design and construction of a new \$75 million wastewater treatment plant at the Rancho Colina site. This facility will replace the existing treatment plant jointly owned by the City and Cayucos Sanitary District. The new treatment plant will be a "reclamation ready" facility designed to meet current and future permit requirements.
  - A City anticipates pursuing a design-build process with a) \$10 million of design, environmental, and other preliminary costs needed through the end of fiscal year

2016/17, and b) almost \$65 million in funding needed during a 2-year construction phase starting 2017/18.

- The City anticipates fully funding the facility with a low-rate Clean Water State Revolving Fund Loan. Annual debt service is projected at a little under \$4 million per year starting 2019/20, the year after the project is complete. In order to provide interim funding for design and other preliminary costs leading up to construction, the City should pursue an SRF Planning Loan, which can subsequently be rolled into the long-term construction financing agreement.
- The City anticipates that Cayucos Sanitary District will fund 25% to 30% the costs of the new facility either as a partner or customer. For planning purposes, the financial projections assume Cayucos SD funds 25% of annual debt service for the new facility.

#### ➤ **Repair & Replacement of Aging Facilities**

- The City's sewer system capital improvement program identifies approximately \$10 million (current \$) of funding needs over the next 10 years, including \$7.6 million (current \$) of sewer collection system rehabilitation and upgrades over the upcoming five years. Many of the City's sewer pipelines are over 50 years old and are approaching the end of their useful lives. The City anticipates funding these projects on a pay-as-you-go cash basis.
- In anticipation of a new wastewater treatment plant, the City has deferred a number of capital improvements needed at the existing treatment plant. Some of these projects can no longer be deferred and are needed to ensure continued safe and reliable operations and compliance with the City's waste discharge permit. The City anticipates funding about \$2.3 million of major maintenance and repair projects at the existing treatment plant over the current and subsequent three fiscal years. The City anticipates funding these projects on a pay-as-you-go cash basis with Cayucos SD contributing 25% of project costs.

#### ➤ **Operating Cost Inflation**

- Annual rate increases are needed to keep revenues in line with ongoing operating cost inflation. Cost inflation for water and wastewater utilities (whose costs are largely related to labor and capital) has historically been higher than CPI, which is more of a measure of urban goods and services.

## Financial Projections

- BWA developed 10-year financial projections to evaluate annual revenue requirements and project sewer rate increases. The projections were based on reasonable and slightly conservative assumptions including:
  - Operating cost projections are based on the 2014/15 Budget
  - Operating cost inflation is projected at 4% per year for planning purposes
  - The projections assume a relatively low growth scenario of 10 new single family homes or equivalent units per year
  - Sewer revenue projections account for a small decline in volumetric sewer sales in response to water and sewer rate increases.
  - Assumes the City funds the proposed new \$75 million Water Reclamation Facility via a Clean Water State Revolving Fund (SRF) loan. The SRF financing program currently offers 20 or 30-year loans with interest rates below 2%. For planning purposes, the projections assume a 30-year SRF loan with a 3% annual interest rate. The projections assume that Cayucos Sanitary District pays 25% of the debt service.
  - A minimum fund reserve target for planning purposes is recommended at 25% of annual operating expenses, plus \$1 million for emergency capital reserves. It is acceptable for reserves to temporarily drop below these levels provided the City has taken action to achieve the targets over the longer run.

## Draft Rate Projections

- Cash flow projections indicate the need for substantial sewer rate increases over the next five years. Monthly single family residential sewer charges are projected to steadily increase from the current level of \$45.59 to \$83.00 over the next five fiscal years.
- Unlike water rates, which require a large up-front increase to restore water system financial stability, sewer rates can be more gradually phased in because a) the sewer enterprise is starting from a stronger financial position, and b) the City anticipates funding the new wastewater treatment plant with SRF loans and projects that debt service for the new plant will not start until 2019/20, one year after construction is complete.
- Deferring or reducing necessary rate increases in the near-term would result in the need for higher rate increases in future years (and vice versa)
- The financial projections indicate the need for small annual rate increases after the next five years. Small future annual rate adjustments are recommended keep revenues in line with operating cost inflation and help minimize the potential for future rate spikes.

## Sewer Rate Structure

- The City's current residential sewer rate structure includes a fixed charge of \$45.59 per month per account, plus a volumetric charge of \$4.07 applied to metered water use over 10 hcf for single family homes and apartments, and use in excess of 3 hcf for condos. Non-residential accounts pay volumetric rates that vary based on customer type subject to a minimum monthly charge of \$51.77.
- BWA developed draft rate projections based on a cost-of-service approach.
  - Operating and capital expenses are allocated for cost recovery from the parameters of wastewater flow and strength, as designated by biological oxygen demand (BOD) and suspended solids (SS).
  - The total amount of costs allocated to each parameter is divided by the total amount of estimated loadings for each parameter, resulting in unit costs for flow, BOD and SS.
  - These unit costs are then applied to the wastewater characteristics of each customer class, resulting in rates that are equitably aligned with the wastewater characteristics of each class.
- The draft rate projections include modifications to the existing sewer rate structure including:
  - Residential rates are revised to include fixed monthly charges per dwelling unit only and eliminate the additional volumetric charges levied on water use over the monthly allowance. Only a small amount of revenues are currently generated by the volumetric charges, and they may be recovering charges for outdoor water use that does not get returned to the sewer system.
  - Under the proposed residential rates, multi-family residential units and condominiums would pay reduced charges equal to 80% of the single family charge based on analysis of winter water use data and proposed cost allocations.
  - Although the City's non-residential rates list 18 customer classes, these customers are billed only five different sewer rates. The proposed rates continue to include five rate classes, with each class defined based on wastewater strength (Low, Domestic, Moderate, Mod-High, and High Strength).

- Two commercial customer classes are reclassified based on wastewater strength:
  - Mobile home parks, which currently pay volumetric commercial sewer rates (not residential rates per dwelling unit), are reclassified from Class A – Low Strength to Class B – Domestic Strength.
  - The City’s single retirement home with dining is reclassified from Class D – Mod-High Strength to Class C – Moderate Strength.
- New rates were developed based on a cost of service methodology that equitably recovers costs for wastewater flow and strength from each each customer class. Costs were allocated for recovery via the wastewater treatment parameters of flow, Biological Oxygen Demand (BOD), and Suspended Solids (SS). Costs allocated to each parameter were then divided by the total estimated loadings for each parameter, resulting in unit costs for flow (\$ per hcf) and strength (\$ per pound for BOD and SS). These unit costs were then applied to the wastewater characteristics of each customer class resulting in new rates for each class based on common underlying unit costs.
- Rate adjustments from current rates to proposed maximum rates in 2019/20 were phased in over five years based on the overall level of required rate increases as determined from the financial projections. Under the proposed draft rates, rates for each non-residential customer class increase by roughly a similar dollar amount (not the same percentage amount) over the next five years.
- The minimum charge for non-residential sewer accounts is revised from being higher than the current fixed residential charge, to the reduced flat monthly charge proposed for multi-family residential accounts, equal to 80% of the single family rate.

## Proposed Sewer Rates & Impacts

- The following table shows a schedule of proposed sewer rates for the next 5 years. Residential customers pay a fixed monthly charge per dwelling unit with reduced charges for multi-family and condominium dwelling units. Non-residential customers pay a charge based on customer class and metered water consumption, subject to a minimum charge set at the reduced charge per multi-family dwelling unit.

### Proposed Sewer Rates & Impacts

|                                             | Current | Proposed |         |         |         |         | 5-Year  |
|---------------------------------------------|---------|----------|---------|---------|---------|---------|---------|
|                                             | 2014/15 | 2015/16  | 2016/17 | 2017/18 | 2018/19 | 2019/20 | Impact  |
| <b>RESIDENTIAL</b>                          |         |          |         |         |         |         |         |
| <i>Charge per residential dwelling unit</i> |         |          |         |         |         |         |         |
| Single Family                               | \$45.59 | \$55.00  | \$62.50 | \$70.00 | \$77.00 | \$83.00 | \$37.41 |
| Multi-Family/Condo                          | varies  | 44.00    | 50.00   | 56.00   | 61.60   | 66.40   | varies  |
| % of Single Family                          |         | 80%      | 80%     | 80%     | 80%     | 80%     |         |
| <b>NON-RESIDENTIAL</b>                      |         |          |         |         |         |         |         |
| <i>Rate per hcf of metered water use</i>    |         |          |         |         |         |         |         |
| Class A - Low Strength                      | \$4.63  | \$6.50   | \$7.95  | \$9.37  | \$10.57 | \$11.40 | \$6.77  |
| Class B - Domestic Strength                 | 5.82    | 7.98     | 9.65    | 11.29   | 12.67   | 13.61   | 7.79    |
| Class C - Moderate Strength                 | 8.03    | 10.19    | 11.86   | 13.50   | 14.89   | 15.82   | 7.79    |
| Class D - Mod-High Strength                 | 10.45   | 12.55    | 14.18   | 15.78   | 17.13   | 18.03   | 7.58    |
| Class E - High Strength                     | 13.38   | 15.89    | 17.84   | 19.75   | 21.36   | 22.46   | 9.08    |
| <b>Minimum Annual Charge</b>                | 51.77   | 44.00    | 50.00   | 56.00   | 61.60   | 66.40   | 14.63   |

Note: 1 hcf = 100 cubic feet = approximately 748 gallons

## 4. OTHER RECOMMENDATIONS

### Debt Financing Recommendations

- BWA strongly recommends the City pursue low-cost, subsidized funding from the Clean Water State Revolving Fund (SRF) Financing Program to finance the new Water Reclamation Facility and subsequent recycled water project.
  - The SRF financing program offers low-rate loans with 20 to 30 year repayment terms and interest rates currently below 2%. Interest rates are based on approximately half the average interest rate of the most recent California state general obligation bond issuance.
  - The SRF financing program will soon be administering disbursement of California Proposition 1 financing, which will provide 1% interest rate loans for recycled water projects as well as some grant funding for economically disadvantaged communities. Due to the 4 to 5 year anticipated timing for planning, designing, and constructing a new wastewater treatment plant, it is unknown if the City's project will be eligible for funding from this upcoming financing program.
  - Debt service on SRF loans is not due until one year following the project's certified completion date.
  - In recent years, the SRF program has been requiring agencies to establish a debt service reserve fund equal to annual debt service.
  - The SRF program also typically requires agencies to maintain annual net revenues (gross revenues less operating expenses) equal to at least 1.10x of annual debt service, although some agencies may be required to maintain a 1.20x debt service coverage ratio.
  - Prior to award of funding, the SRF program requires agencies to adopt rates adequate to support debt repayment and achieve the required debt service coverage ratio.
  - The SRF financing program does not provide a final funding commitment until after the project has been designed and bid out in compliance with SRF specifications. Agencies can subsequently seek reimbursement for preliminary design and other soft costs incurred prior to construction award.
  - Due to the need for approximately \$10 million of funding for preliminary engineering, design, and other soft costs leading up to construction of the proposed Water Reclamation Plant, BWA recommends the City pursue an SRF Planning Loan to help fund

these costs. If awarded, repayment of SRF planning loans can be rolled into the long-term SRF project loan.

- During construction, agencies fund ongoing construction invoices and can subsequently seek monthly reimbursement from SRF. However, the City needs to be prepared to fund a few months of project expenditures due to the lag in reimbursements. BWA has assisted agencies in obtaining a competitively-bid line of credit in cases where agencies have not had adequate fund reserves to meet the cash flow needs of their SRF projects.
- BWA also recommends the City submit an inquiry form to the California Financing Coordinating Committee to identify if the City is eligible for subsidized funding from other various state and federal financing programs, such as the California Infrastructure and Economic Development Bank (I-Bank), for its debt financing needs.

### **Proposition 218 Rate Increase Process**

- In order to increase rates, the City must comply with the procedural requirements of Article 13D, Section 6 of the California Constitution, which was established by Proposition 218. These requirements require the City to:
  - Mail a notice of to all affected property-owners informing them of a) the proposed rate increases, b) the basis for increases, and c) the date, time, and location of a Public Hearing at which the proposed rates will be considered for adoption.
    - There are differing legal opinions regarding who agencies must mail the required notice too. Many agencies mail notices to all affected property owners only, some mail to both property owners and tenant ratepayers responsible for paying the bill, and a few agencies only send the notice to ratepayers. However, in case of delinquency, agencies are only allowed to place a lien on the property if the notice was mailed to the property owner.
    - BWA recommends the notice go beyond the minimum legal requirements and present a clear and concise explanation why the proposed rate increases are needed. Ratepayers are more accepting of rate increases when they understand why the increases are needed.
  - Hold a Public Hearing on the proposed rate increases not less than 45 days after the notice is mailed. Most agencies schedule the Public Hearing during a regularly-scheduled meeting of their governing body.

- BWA recommends that the City establish a clear structure for the Board Meeting and Public Hearing in advance to help ensure the process is understandable to the Board and public and goes as smoothly as possible.
- At the Public Hearing, the proposed rate increases are subject to “majority protest” and cannot be adopted if written protests are received from more than 50% of affected parcels, with one protest counted per parcel.
  - BWA generally recommends agencies take a lenient approach to counting written protests at the Public Hearing to demonstrate a good-faith effort to count every protest, even if some protests do not include all of the legally-required information.

### **Low-Income Discount**

- The Public Works Advisory Committee generally supported the idea of adopting a low-income discount program in Morro Bay. If the City opts to pursue a low-income discount program, BWA recommends that eligibility be based on economic criteria only.
- Based on BWA’s experience with other water and wastewater agencies throughout California, roughly 25% of statewide water and sewer agencies offer some form of a low-income discount. The amount of the discount typically ranges from 10% to 20% of the utility bill, but is occasionally lower or higher. In some cases, the discount is a fixed dollar amount (e.g. \$5 per month).
- Eligibility requirements vary from agency to agency. While some agencies independently verify a customer’s income, BWA would instead recommend the City piggy-back on some other low-income discount program – such as the PG&E CARE program -- to avoid the administrative effort of having to determine program eligibility. For example, customers who provide proof of eligibility in the CARE program would qualify for the City’s low-income discount. Qualification for the discount should be verified annually; the discount should not automatically extend forever.
  - PG&E CARE program eligibility is based on income thresholds per number of people per home. Current maximum income levels for eligibility are as follows:
    - \$31,460 for 1 or 2 people
    - \$39,580 for 3 people
    - \$47,700 for 4 people, etc.

- Other eligibility criteria can include participation in various federal assistance programs (such as AFDC, SSI/SSP, food stamps, and/or other programs) and other utility discount programs such as if offered by the customer's telephone company.
  - There are some additional details that would have to be resolved, such as how to provide the discount to a unit in a multi-family or mixed use property with a single master-meter bill.
-

1 Some costs may not be eligible for SRF Loan funding & would require another funding source

2 Assumes steady gradual drawdown of loan funds over two years.

3 Total net interest rate estimated for financial planning purposes; actual rate may vary.

4 First debt service payment due one year following completion of project.

5 Agencies must set aside funds to meet the SRF Reserve Requirement at least 90 days prior to project completion date.

1 Some costs may not be eligible for SRF Loan funding & would require another funding source.

2 Assumes steady gradual drawdown of loan funds over two years.

3 Total net interest rate estimated for financial planning purposes; actual rate may vary.

4 First debt service payment due one year following completion of project.

5 Agencies must set aside funds to meet the SRF Reserve Requirement at least 90 days prior to project completion date.

# City of Morro Bay

## Financial Plan & Rate Analysis for a New Water Reclamation Facility

---

### 1. Background

The City of Morro Bay is located on the Central California coast in San Luis Obispo County, about 12 miles northwest of the City of San Luis Obispo. The City has a population of approximately 10,500. The City provides water and wastewater service to residents and businesses within the City.

The City's existing wastewater treatment plant has reached the end of its useful life and needs to be rebuilt due to a number of factors including age and condition, as well as capacity and regulatory deficiencies. The existing plant was originally built in 1953 and last underwent major upgrades in 1984. The existing plant does not meet current wastewater discharge permit requirements and needs to be rebuilt to comply with the City's new Waste Discharge Permit requirement within a maximum of five years, as required by the Central Coast Regional Water Quality Control Board (RWQCB). Failure to meet the RWQCB's permit requirements can result in substantial fines.

Adding to the City's challenges, the wastewater treatment plant cannot be rebuilt at its current location. The existing plant is located on the coast in a flood plain and tsunami inundation zone. In 2013, the California Coastal Commission denied the City's development permit to build a new treatment plant near the existing site. In 2015 the Commission issued Sea Level Rise Policy Guidance that strongly discourages siting facilities in areas where they could be adversely affected by the impacts of sea level rise over the full life of the structure. The current location is also inconsistent with other provisions of the Coastal Act and Local Coastal Program.

Based on evaluation of a wide range of project and site alternatives, the City is now moving forward with a new Water Reclamation Facility (WRF) at a proposed site near the intersection of South Bay Boulevard and Highway 1, approximately 1 mile east of downtown Morro Bay. In June 2018, pursuant to a competitive proposal process, the City selected a team to construct the new WRF via a design-build process. The City is currently undergoing negotiations with the selected design-build team.

The full WRF project includes a new wastewater treatment plant, pumping facilities, a pipeline to convey wastewater to the new WRF, and water recycling facilities for potable reuse. Water recycling facilities are included in the WRF project for a number of reasons including:

- The City predominantly relies on imported water from the State Water Project for the

community's water supply. Recycled water provides the City with a relatively drought-proof local supply that improves water supply security and reliability.

- While water recycling infrastructure adds significant cost to the WRF project, it also helps make the WRF project eligible and competitive for grants and low-interest-rate loans. Financial analysis indicates that the impact of the added costs of the recycled water facilities would be largely offset by the financial benefits of subsidized financing available with recycling.
- Water recycling was identified as a community goal for the new WRF.

## 2. Study Overview

Bartle Wells Associates (BWA) was retained to develop a financial plan and rate recommendations to support funding for the new WRF as well ongoing operating and capital improvement needs. This report presents findings and rate recommendations developed under a few financial scenarios. The proposed WRF Facility Surcharges were developed with input from City staff, Carollo Engineers, and the City's Blue Ribbon Commission -- a group of Morro Bay residents with substantial financial and business experience that was established to provide independent review and help evaluate the costs and potential rate increases needed to support the new WRF.

The City's water and sewer utilities are financially self-supporting enterprises funded primarily from monthly service charges. *In order to secure financing for the WRF, the City will need to first adopt utility rates adequate to repay debt service for the new WRF.*

BWA developed financial projections and rate recommendations under four alternative scenarios.

- Base Case Scenario:** This scenario assumes the WRF project is funded by a combination of WIFIA financing, revenue bonds, and pay-as-you go cash funding from rates and fund reserves. Under this scenario, the City would levy the full WRF Facility Surcharges beginning fiscal year 2019/20.
- Phase-In Scenario:** This scenario is similar to the Base Case Scenario, but assumes the WRF Facility Surcharges would be phased in from fiscal year 2019/20 through 2021/22.
- SRF Financing Scenario:** This scenario assumes the City obtains low-rate SRF financing, instead of bonds, to supplement the anticipated WIFIA loan and cash funding.
- No Water Recycling Scenario:** This scenario eliminates the water recycling facilities resulting in a reduced-cost, wastewater-only WRF project, and also assumes no WIFIA financing with all project funding from bonds and pay-as-you-go cash contributions.

### 3. Prior Rate Increases & Need for WRF Surcharges

In 2015, the City adopted 5-years of water and sewer rate increases. The adopted rates were designed to phase in funding to support the cost of providing utility service and help provide funding for capital improvements to aging infrastructure. As of July 1, 2018, the City will have implemented 4 of the 5 years of adopted rate increases. Prior to these rate increases, the City had not adopted any water rate increases in 20 years but had periodically adopted some sewer rate adjustments.

The previously-adopted sewer rates were also designed to help support funding for a new wastewater treatment plant assuming Morro Bay would need to fund approximately \$56 million of project costs, equal to 75% of an estimated \$75 million wastewater treatment plant that would be jointly owned with Cayucos funding the remaining 25%. The \$75 million preliminary cost estimate from 2015 was based on a conceptual design and parametric estimates.

In addition, the adopted rates were not designed to fund recycled water facilities, which were previously expected to be a future phase of the project. The adopted sewer rates also assumed the City would be able to obtain low-rate financing from the State Revolving Fund (SRF) for all debt financing needs of the new treatment plant. SRF financing was previously fairly easy to obtain but is now substantially more difficult to secure.

The adopted rates substantially strengthened the financial condition of the City's water and sewer utilities but do not provide adequate funding to support each utility's share of costs for the new WRF. Additional water and sewer charges are needed to provide adequate funding for each utility's share of debt service for the WRF project.

BWA recommends the City adopt new water and sewer WRF Facility Surcharges to supplement the previously-adopted rates in order to provide adequate funding for WRF-related debt repayment. These would be separate surcharges levied in addition to the City's adopted utility rates.

## 4. Summary of Proposed WRF Facility Surcharges

Table 1 shows proposed WRF Facility Surcharges for single family residential customers under the four financial scenarios. Note that the surcharges shown under the Phase-In Scenario are maximum surcharges with full phase-in starting 2022/23. Surcharges for residential customers are structured as fixed monthly charges. Surcharges for all customer classes are detailed later in this report.

**Table 1 – Summary of Maximum Single Family Residential WRF Facility Surcharges**

|                                | Base Case                    | Phase-In                        | WIFIA & SRF                | No Recycling*             |
|--------------------------------|------------------------------|---------------------------------|----------------------------|---------------------------|
|                                | WRF+Recycling<br>WIFIA+Bonds | Base Case with<br>Rate Phase In | WRF+Recycling<br>WIFIA+SRF | No Recycling<br>All Bonds |
| <b>WRF Facility Surcharges</b> |                              |                                 |                            |                           |
| Sewer WRF Facility Surcharge   | \$25.00                      | \$27.00                         | \$20.00                    | \$44.00                   |
| Water WRF Facility Surcharge   | 16.00                        | 17.00                           | 14.00                      | -                         |
| <b>Total</b>                   | <b>41.00</b>                 | <b>44.00</b>                    | <b>34.00</b>               | <b>44.00*</b>             |

\* Under the No Recycling Scenario, the fifth and final year of the previously-adopted water rate increases would not need to be implemented, resulting in a \$4.50 reduction in the monthly water bill for a typical single family home using 5 units of water per month compared to other scenarios. This results in a net reduction of \$1.50 per month compared to the Base Case Scenario.

## 5. Key Alternative for Implementing & Billing WRF Facility Surcharges

The City has options for implementing and billing the proposed WRF Facility Surcharge as discussed below.

### Timing of Surcharge Implementation

At this stage, the City is considering two approaches regarding the timing of implementing the WRF Facility Surcharges, including:

- **Front-Load** - Levy the full WRF Facility Surcharges starting fiscal year 2019/20 (Base Case Scenario)
- **Phase-In** - Phase-in the WRF Facility Surcharges in upcoming years (Phase-In Scenario)

The Phase-In Scenario results in a lower level of surcharge revenues than the front-loaded Base Case Scenario until the surcharges are fully phased-in. The Phase-In Scenario results in approximately \$4.3 million less of pay-as-you-go cash funding which results in the need for a corresponding increase in debt financing, higher annual debt service, and ultimately a higher surcharge.

### **Method of Bill Collection**

The City currently bills customers monthly via a combined utility bill for water and sewer service. The City is considering two methods of bill collection for recovering the WRF Facility Surcharges, including:

- **Monthly Billing** - Add the WRF Facility Surcharges as a new line-item in the monthly bills.
- **Property Tax Rolls** - Recover the proposed WRF Facility Surcharges on the property tax rolls.

The WRF Facility Surcharges would be the same under both billing alternatives and in many cases would be paid by the same people; only the method of billing and collection would vary. Additional information regarding potential billing on the property tax rolls is included later in this report.

### **Community & Advisory Board/Committee Input Received**

The City conducted a community workshop to discuss the WRF project and proposed rate surcharges on Saturday, June 23, 2018. During the workshop, community members were requested to provide their preferences regarding: a) either phasing in or front-loading the WRF Facility Surcharges, and b) billing the WRF Facility Surcharges as a separate line-item on the monthly utilities bill vs. submitting the surcharges for recovery via the property tax rolls. Community members who participated at the workshop were fairly evenly split regarding their preferences on both the potential phase-in and method of bill collection.

The same feedback was sought from members of the Public Works Advisory Board (PWAB), Water Reclamation Facility Citizens Advisory Committee (WRFCAC), and Citizens Finance Advisory Committee (CFAC) during a joint meeting between these three committees held on June 25, 2018. Advisory board and committee members slightly favored phasing in the surcharges and strongly favored including the surcharges on the monthly utilities bill, not on the property tax rolls.

## 6. Total Monthly Water & Sewer Charges with WRF Facility Surcharges

Tables 2A and 2B show the total combined monthly water and sewer charges – including water and sewer service charges and the proposed WRF Facility Surcharges – for a typical single family home using 5 units (hcf) of water use per month under the Base Case and Phase-In Scenarios. Under the Phase-In Scenario, pay-as-you-go cash funding for the WRF Project generated by the Surcharges would be reduced by approximately \$4.3 million compared to the Base Case Scenario. This results in the need for a corresponding amount of additional debt financing which results in slightly higher debt service and a higher maximum surcharge.

Note that monthly single family residential use has averaged about 4.6 units (hcf) over the past year. BWA estimates that roughly 2/3rds of single family residential bills are at or below 5 hcf.

**Table 2A – Base Case Scenario: Total Monthly Charges with WRF Surcharges**

Typical Single Family Home with 5 Units (hcf) Monthly Water Use

|                                | 2018/19       | 2019/20       | 2020/21       | 2021/22       | 2022/23       |
|--------------------------------|---------------|---------------|---------------|---------------|---------------|
| <b>Monthly Utility Bill</b>    |               |               |               |               |               |
| Sewer Monthly Charge           | \$77.00       | \$83.00       | \$83.00       | \$83.00       | \$83.00       |

## 7. WRF Project Costs & Timing

Table 3 shows projected WRF project capital and operating costs based on the winning design-build proposal received by the City (which is subject to final negotiation) and engineering cost estimates provided by Carollo Engineers. The WRF project is currently estimated to cost a total of \$122.8 million including all expenses incurred to date.

**Table 3 – WRF Project Cost Estimates**

|                                                                                | Construction<br>Costs <sup>1</sup> | Soft<br>Costs        | Project<br>Reserves <sup>2</sup> | Total<br>Cost          |

Source: Carollo Engineers, WRF Program Revised Cost Estimates as of 6/20/18.

1 Construction costs Include estimated cost inflation to construction mid-point where applicable.

2 Project Reserves are placeholder estimates for additional project funding requirements (e.g. outside project scope) with funding subject to City control.

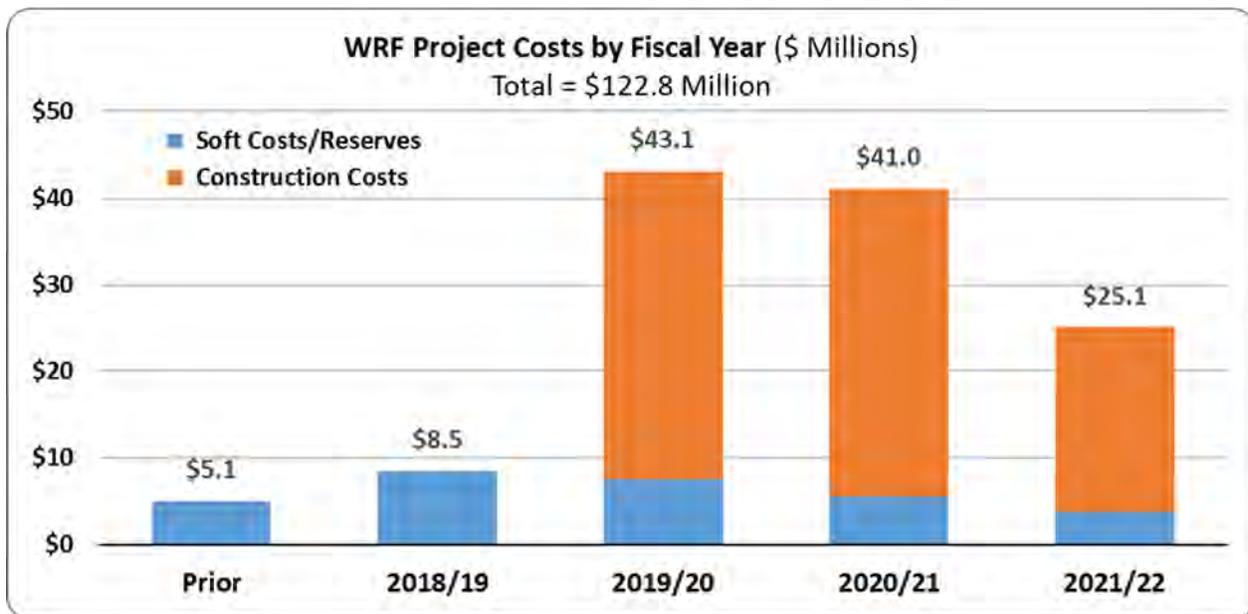

3 Offsite Recycled Water Facilities assume West alternative and include property acquisition estimate.

Without recycled water infrastructure, the total cost of project is reduced by approximately \$20 million to an estimated total of \$102.2 million. The reduction includes elimination of \$12 million of Offsite Recycled Water Facilities, and an \$8 million reduction in costs for the wastewater treatment plant. Tables detailing financial projections for a No Water Recycling Scenario are included in the appendix.

Table 4 shows projected WRF costs by fiscal year. The City estimates that a little over \$5 million will have been spent by the end of fiscal year 2017/18, with future costs totaling about \$117.7 million including estimated cost inflation to the projected mid-point of construction for each project component. The City anticipates incurring costs primarily for design in 2018/19, with construction occurring during the subsequent 3 fiscal years. The new wastewater treatment facility is targeted for completion by October 2021 with operations targeted to start January 2022.

**Table 4 – Projected WRF Costs by Fiscal Year**

|                  | Prior Costs |           |           | Projected Costs |            |            |             |

## 8. Water vs. Wastewater Cost Allocation

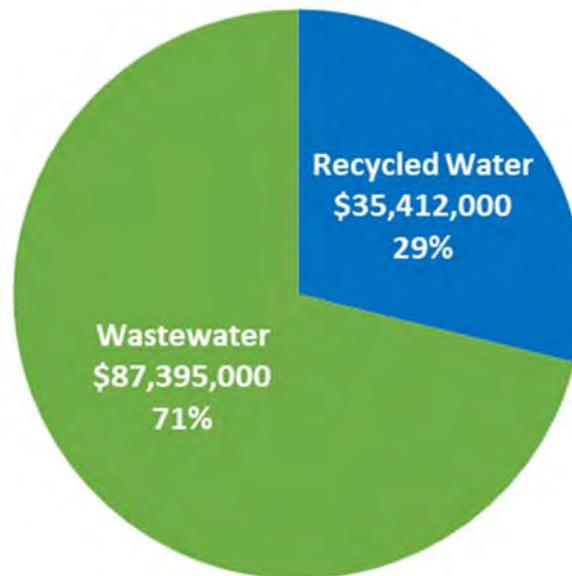

Table 5 shows an allocation of WRF project costs to water vs. wastewater based on analysis developed by Carollo Engineers. Costs allocated to the water utility include all facility costs related to recycled water production that are in excess of the costs that would be incurred for constructing a new WRF for wastewater only. Each utility is responsible for funding its share of project costs.

**Table 5 – WRF Project Cost Allocation to Water vs. Wastewater**

| Project Component                | Total Cost         | Water             |              | Wastewater        |              |
|----------------------------------|--------------------|-------------------|--------------|-------------------|--------------|
| Water Reclamation Facility       | \$74,236,000       | \$21,528,000      | 29.0%        | \$52,708,000      | 71.0%        |

| <b>Total</b>                     | <b>122,807,000</b> | <b>35,412,000</b> | <b>28.8%</b> | <b>87,395,000</b> | <b>71.2%</b> |

\* Allocated based on proportionate share of total future facility costs.

### Wastewater vs. Recycled Water Costs

## 9. WRF Project Funding Sources

The City anticipates funding the WRF project via a combination of long-term debt and pay-as-you-go cash funding provided by utility rates and available fund reserves. The Base Case Scenario assumes the City secures WIFIA funding for the maximum allowable 49% of the WRF project cost, with remaining funding provided by cash funding and revenue bonds. Table 6 and the chart below show a breakdown of anticipated funding sources for the WRF project under the Base Case Scenario. For comparison, the Phase-In Scenario results in \$4.3 million of reduced cash funding for the WRF and a corresponding \$4.3 million increase in Revenue Bond financing.

**Table 6A – Base Case: WRF Project Funding Sources**

|                                  | Total            | % of Ttl    | Water          | % of Source | Wastewater       | % of Source  |
|----------------------------------|------------------|-------------|----------------|-------------|------------------|--------------|

| Revenue Bonds              |                  |                  |                   | 7,400,000         | 17,300,000        |
| Sewer Cash Contribution    | 4,819,000        | 2,390,000        | 5,307,000         | 3,374,000         | 6,898,000         |
| Water Cash Contribution    | 244,000          | 300,000          | 2,200,000         | 1,200,000         | 900,000           |
| <b>Total</b>               | <u>5,063,000</u> | <u>8,490,000</u> | <u>43,107,000</u> | <u>41,049,000</u> | <u>25,098,000</u> |

The City has been pursuing state and federal grants and low-interest-rate loans to help finance the WRF project. The City has been successful in obtaining commitments for a substantial amount of low-interest-rate financing to date and continues to seek additional financial assistance. The City has retained Kestrel Consulting, a grant specialist, to assist in identifying and applying for grants and subsidized financing programs.

- The City was awarded a \$10.3 million Planning Loan from California’s Clean Water State Revolving Fund (SRF) Financing Program with a subsidized interest rate of 1.7%.
- Morro Bay was as one of 12 communities nationwide invited to apply for low-interest-rate financing from the Water Infrastructure and Financing Innovation Act (WIFIA) funding program administered by the United State Environmental Protection Agency (EPA). WIFIA financing can be used to fund up to 49% of the WRF project cost and has favorable repayment terms including low interest rates. The rate for a long-term WIFIA loan is currently in the 3% range but would not be formally set until final approval is obtained.
- The City was previously awarded a small Recycled Water Planning Feasibility Study Grant.
- The City is pursuing additional financing from Clean Water SRF Financing Program, which offers low-interest-rate loans – currently below 2% -- and repayment terms up to 30 years.
- The City has been pursuing grant financing from the United States Bureau of Reclamation.

Any additional grant or subsidized loan financing received would result in lower future debt service and could reduce annual funding needs from future water and sewer charges.

## 10. Debt Service Estimates

Tables 8A and 8B show debt service estimates under the Base Case and Phase-In Scenarios. Debt service is partially structured around the 10-year repayment term of the SRF Planning Loan to result in level annual future debt service. The debt service estimates for the anticipated WIFIA Loan and projected Revenue Bonds are based on slightly conservative assumptions of interest rates. Interest rates are currently lower but would be established when the WIFIA financing agreement is finalized and when Revenue Bonds are issued.

**Table 8A – Base Case: Debt Service Estimates**

|                     | SRF<br>Planning Loan | WIFIA<br>Loan | Revenue<br>Bonds | Total        |
|---------------------|----------------------|---------------|------------------|--------------|
| Project Funding     | \$10,300,000         | \$60,175,000  | \$24,700,000     | \$95,175,000 |
| Term                | 10 Years             | 35 Years      | 30 Years         | All-In TIC   |
| Avg Interest Rate   | 1.70%                | 3.25%         | 4.70%            | 3.48%        |
| <b>Debt Service</b> |                      |               |                  |              |
| Through 2029/30     | \$1,130,000          | \$2,973,000   | \$1,190,000      | \$5,293,000  |
| After 2029/30       | -                    | \$3,422,000   | \$1,871,000      | \$5,293,000  |

The Phase-In Scenario generates less cash funding for the WRF Project which results in a corresponding increase in debt financing needs from revenue bonds and a resulting increase in debt financing and debt service.

**Table 8B – Phase-In: Debt Service Estimates**

|                     | SRF<br>Planning Loan | WIFIA<br>Loan | Revenue<br>Bonds | Total        |
|---------------------|----------------------|---------------|------------------|--------------|
| Project Funding     | \$10,300,000         | \$60,175,000  | \$29,000,000     | \$99,475,000 |
| Term                | 10 Years             | 35 Years      | 30 Years         | All-In TIC   |
| Avg Interest Rate   | 1.70%                | 3.25%         | 4.70%            | 3.51%        |
| <b>Debt Service</b> |                      |               |                  |              |
| Through 2029/30     | \$1,130,000          | \$3,051,000   | \$1,396,000      | \$5,577,000  |
| After 2029/30       | -                    | \$3,383,000   | \$2,194,000      | \$5,577,000  |

## 11. Capital Improvement Plans

The City recently collaborated with Carollo Engineers to evaluate and prioritize capital improvement needs to the City’s aging water and sewer infrastructure resulting in the development of updated Capital Improvement Plans (CIPs) for the water and sewer utilities. The CIP projects include replacement and rehabilitation of old water and sewer pipelines, water pump stations, sewer lift stations, and water storage tanks. The CIPs are designed to address the highest priority needs the soonest. The City plans to continue evaluating its capital improvement needs and may re-prioritize projects in future years.

Tables 9 and 10 summarize annual water and sewer CIP funding needs. The City plans to fund these improvements on a pay-as-you-go basis with no additional debt. A detailed list of CIP projects and costs is included in the appendix to this report. Note that costs are shown in current dollars.

**Table 9 – Water Capital Improvement Plan Summary**

|                     | Near-Term<br>Years 1 - 5 | Mid-Term<br>Years 6 - 10 | Long-Term<br>Through 2040 |
|---------------------|--------------------------|--------------------------|---------------------------|
| CIP Cost Estimates  | \$6,788,000              | \$4,977,000              | \$11,586,000              |
| Average Annual Cost | 1,357,600                | 995,400                  | 965,500                   |

**Table 10 – Sewer Capital Improvement Plan Summary**

|                     | Near-Term<br>Years 1 - 5 | Mid-Term<br>Years 6 - 10 | Long-Term<br>Through 2040 |
|---------------------|--------------------------|--------------------------|---------------------------|
| CIP Cost Estimates  | \$5,096,000              | \$5,726,000              | \$7,349,000               |
| Average Annual Cost | 1,019,200                | 1,145,200                | 612,417                   |

## 12. Financial Projections

BWA developed 10-year water and sewer utility financial projections to evaluate annual revenue requirements and project rate increases under each of the four financial scenarios. The projections are based on reasonable and slightly conservative assumptions including:

- Operating expenses are based on the 2018/19 preliminary budget.
- Operating costs escalate at the annual rate of 4% per year for planning purposes.
- Future costs for a) wastewater treatment at the new WRF and b) wastewater conveyance to the new WRF, and c) recycled water operations are based on engineering estimates developed by Carollo Engineers and account for future cost inflation.
- The projections assume a low-growth scenario of 5 new single family homes or equivalents per year.
- Water and sewer service charge revenues assume monthly water use remains constant based on usage over the past fiscal year. Note that residential sewer rates and all WRF Facility Surcharges are fixed monthly charges that do not vary with changes in water use.
- Sewer financial projections assume that Cayucos Sanitary District funds 25% of the operating costs of the existing wastewater treatment plant for two more fiscal years – through 2019/20 – after which Cayucos anticipates transitioning to its own planned treatment facility. *Note: The reduction in wastewater flow from Cayucos SD is not projected to result in a significant decrease in operating costs. Most of the wastewater treatment plant's operating and maintenance costs are fixed costs (e.g. staffing) that do not vary with changes in wastewater flow.*
- The sewer cash flow projections show how the entire WRF Project is funded and include the full debt service payments which are offset by the debt service paid by the water utility.
- Water and sewer capital improvement plans are funded entirely on a pay-as-you-go basis from revenues generated each year by water and sewer service charges.
- The City has accrued some fund reserves that can eventually be applied toward the WRF Project and anticipates generating additional cash contributions for the project from future rates and WRF Facility Surcharges. BWA recommends the City maintain its water and sewer fund reserves while the WRF Project is being built. The City can draw down a portion of its water and sewer fund reserves during fiscal year 2021/11, the final year of construction. Over the longer-term, the cash flow projections assume the City would maintain at least \$4 million in fund reserves for each utility.

Tables 11A and 12A show 10-year sewer cash flow projections and water cash flow projections under the Base Case Scenario. Tables 11B and 12B show financial projections under the Phase-In Scenario.

**Table 11A - City of Morro Bay - Sewer Cash Flow Projections**

**Base Case Scenario**

| Years 1 - 5                           | Projected        |                  |             |             |             |
|---------------------------------------|------------------|------------------|-------------|-------------|-------------|
|                                       | 2017/18          | 2018/19          | 2019/20     | 2020/21     | 2021/22     |
| Monthly Single Family Sewer Charge    | \$70.00          | \$77.00          | \$83.00     | \$83.00     | \$83.00     |
| Monthly Single Family Surcharge       |                  |                  | \$25.00     | \$25.00     | \$25.00     |

## Phase-In Scenario

### 13. Debt Service Coverage

Tables 13A and 13B show projected debt service coverage independently for the sewer and water utilities as well as combined coverage for both utilities under the Base Case and Phase-In Scenarios. Debt service coverage is calculated based on Net Revenues – defined as total revenues less operating and maintenance expenses – divided by annual debt service. Additional funding generated after paying debt service is available to help fund the City’s water and sewer CIP projects.

**Table 13A – Base Case: Debt Service Coverage**

## 14. Sewer WRF Facility Surcharges

Tables 14A and 14B show proposed sewer WRF Facility Surcharges under the Base Case and Phase-In Scenarios. These surcharges would be levied as separate surcharges in addition to the City's previously-adopted sewer rates. The surcharges maintain the same rate structure as the City's existing sewer rates. Residential surcharges are fixed monthly surcharges and Non-Residential surcharges are volumetric rates applied to monthly water use – with higher charges for customer classes with higher wastewater strength -- subject to a minimum charge as shown.

**Table 14A – Base Case: Proposed Monthly Sewer WRF Facility Surcharges**

|                                             | 2018/19 | 2019/20 | 2020/21 | 2021/22 | 2022/23 |

## 15. Water WRF Facility Surcharges

Tables 15A and 15B show proposed water WRF Facility Surcharges under the Base Case and Phase-In Scenarios. Again, these surcharges would be levied in addition to the City’s previously-adopted water rates. Residential surcharges are fixed monthly surcharges and Non-Residential surcharges are volumetric rates applied to monthly water use, subject to a minimum charge as shown.

**Table 15A – Base Case: Proposed Monthly Water WRF Facility Surcharges**

|                                             | 2018/19 | 2019/20 | 2020/21 | 2021/22 | 2022/23 |
|---------------------------------------------|---------|---------|---------|---------|---------|
| <b>RESIDENTIAL</b>                          |         |         |         |         |         |
| <i>Charge per residential dwelling unit</i> |         |         |         |         |         |
| Single Family                               |         | \$16.00 | \$16.00 | \$16.00 | \$16.00 |
| Multi-Family/Condo                          |         | 12.80   | 12.80   | 12.80   | 12.80   |

| <i>Charge per residential dwelling unit</i> |         |         |         |         |         |
| Single Family                               |         | \$8.00  | \$12.00 | \$17.00 | \$17.00 |
| Multi-Family/Condo                          |         | 6.40    | 9.60    | 13.60   | 13.60   |
| <b>NON-RESIDENTIAL</b>                      |         |         |         |         |         |
| <i>Rate per hcf of metered water use</i>    |         |         |         |         |         |
| Surcharge on all water use                  |         | \$1.82  | \$2.73  | \$3.87  | \$3.87  |

## 16. Previously-Adopted Water & Sewer Rates

As of July 1, 2018, the City will have implemented 4 of the 5 years of previously-adopted rate increases. The final rate increase – scheduled to become effective July 1, 2019 – equates to a roughly 7.5% increase for a typical single family home with 5 hcf monthly water use. The adopted rates were originally designed to generate some funding for the WRF Project. Funding from the City’s regular water and sewer rates will supplement the WRF Facility Surcharges, which will recover most of the costs for WRF-related debt service. Based on the financial projections, if the WRF Facility Surcharges are adopted, then no additional water or sewer rate increases – above those previously adopted – would likely need to be implemented over at least the next 5 years. However, the City should periodically evaluate its utility rates in future years to ensure future rates continue to recover the cost of providing service and each utility continues to meet its future financial obligations.

**Table 16 – Adopted Monthly Water Rates**

|                                                                | 2018/19            | 2019/20 | 2020/21             | 2021/22 | 2022/23 |
|----------------------------------------------------------------|--------------------|---------|---------------------|---------|---------|
|                                                                | Adopted            | Adopted | No Change Projected |         |         |
| <b>Fixed Monthly Charge</b>                                    | \$30.00            | \$32.00 | \$32.00             | \$32.00 | \$32.00 |
| <b>Water Quantity Charges</b>                                  |                    |         |                     |         |         |
| <i>Billed per 100 cubic feet of metered water use (\$/hcf)</i> |                    |         |                     |         |         |
| <u>Tier</u>                                                    | <u>Use in Tier</u> |         |                     |         |         |
| Tier 1                                                         | 0 - 3 hcf          | \$5.50  | \$6.00              | \$6.00  | \$6.00  |

## 17. Bill Impacts

The following charts and tables show the total combined billing impacts – with full implementation of previously-adopted water and sewer rates and the proposed WRF Surcharges – on single family homes at different levels of monthly water use under the Base Case Scenario. Impacts on a range of other customer classes under the Base Case Scenario are included in the appendix.

### Base Case Scenario

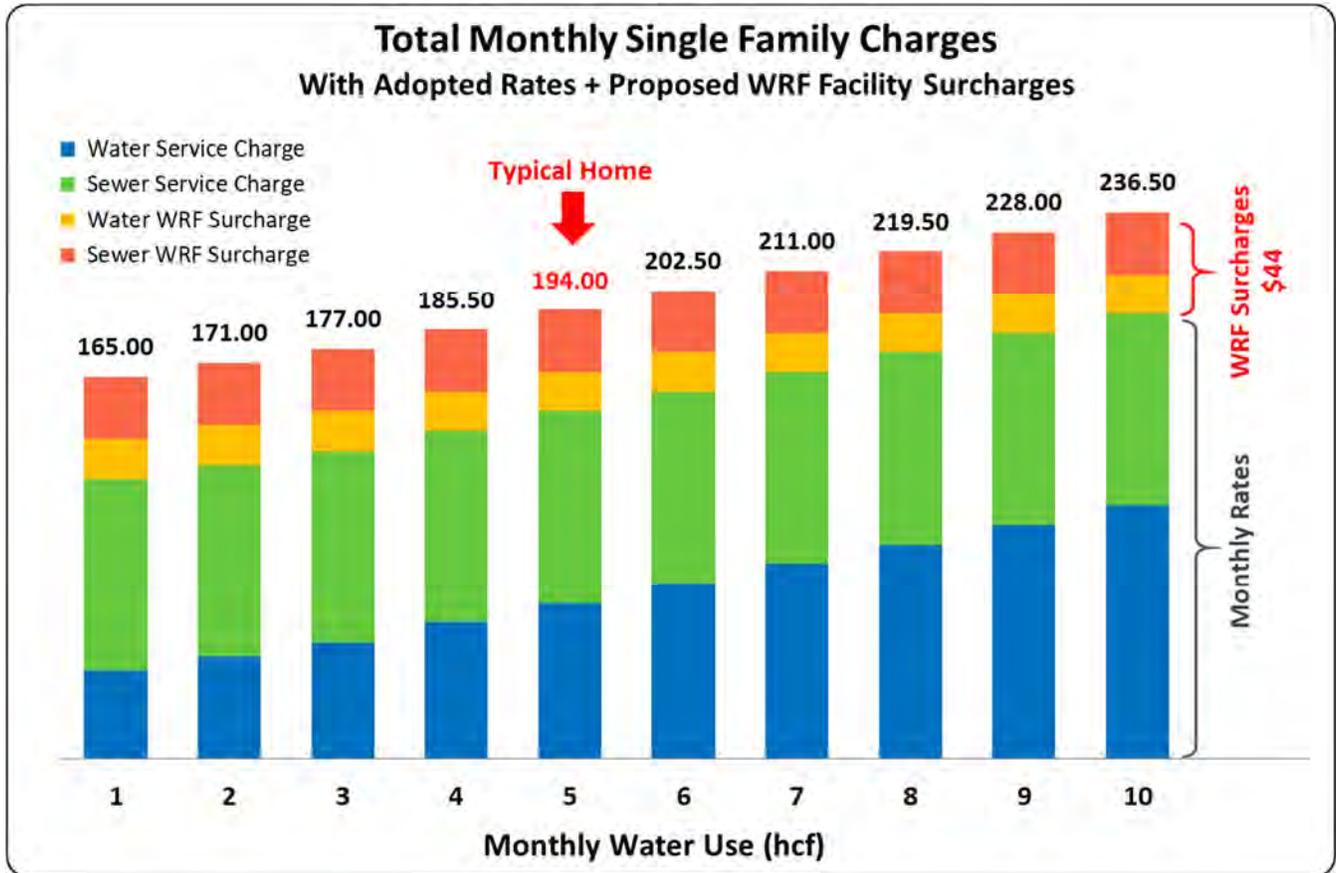

**Table 18A – Base Case: Total Combined Bill with Adopted Rates + Proposed WRF Surcharges**  
Single Family Home at Different Levels of Use

|                       | Monthly Water Use (hcf) |               |               |               |               |               |               |               |               |               |
|-----------------------|-------------------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
|                       | 1                       | 2             | 3             | 4             | 5             | 6             | 7             | 8             | 9             | 10            |
| Water Service Charge  | \$38.00                 | \$44.00       | \$50.00       | \$58.50       | \$67.00       | \$75.50       | \$84.00       | \$92.50       | \$101.00      | \$109.50      |
| Sewer Service Charge  | <u>83.00</u>            | <u>83.00</u>  | <u>83.00</u>  | <u>83.00</u>  | <u>83.00</u>  | <u>83.00</u>  | <u>83.00</u>  | <u>83.00</u>  | <u>83.00</u>  | <u>83.00</u>  |

| WRF Cash Contribution                       | <u>3.22</u>        | <u>0.00</u>          | <u>0.00</u>         |
| Subtotal Water Rate                         | 62.50              | 67.00                | 67.00               |
| <b>WRF Surcharge</b> (for WRF Debt Service) | 0.00               | 16.00                | 17.00               |
| <b>Total</b>                                | <b>62.50</b>       | <b>83.00</b>         | <b>84.00</b>        |

\* Water System O&M in 2022/23 includes recycled water operating expenses of \$220,000.

## 20. Billing Options for WRF Facility Surcharges

The City currently bills customers monthly via a combined utility bill for water and sewer service. The City is considering two methods of bill collection for recovering the WRF Facility Surcharges, including:

- **Monthly Billing** - Add the WRF Facility Surcharges as a new line-item in the monthly bills.
- **Property Tax Rolls** - Recover the proposed WRF Facility Surcharges on the property tax rolls.

The WRF Facility Surcharges would be the same under both alternatives; only the method of billing and collection would vary. For a single family home, adding the surcharges to the property tax rolls, would result in two payments of roughly \$250 that would be added to the semi-annual property tax assessments. Table 20 shows the timing of payments for WRF Facility Surcharges under the Base Case and Phase-In Scenarios with full implementation of the surcharges. Non-residential customers could be billed on the property tax rolls based on usage from the immediately-prior 12-month period.

**Table 20 – Example of Single Family WRF Surcharges Collected with Property Taxes**

|                                | Annual Total | December Installment 1 | April Installment 2 |
|--------------------------------|--------------|------------------------|---------------------|
| <b>WRF Facility Surcharges</b> |              |                        |                     |
| Base Case Scenario             | \$492.00     | \$246.00               | \$246.00            |
| Phase-In Scenario              | 528.00       | 264.00                 | 264.00              |

While there are some administrative differences for billing and collecting the WRF Facility Surcharges under the two billing options, the main difference is who will bear the financial burden of paying the surcharges: ratepayers or property owners. Note that many ratepayers are also property owners and would be the same people paying the same surcharges regardless of billing method. However, the City does serve a number of tenants who currently pay utility bills for their rental units.

Some potential pros, cons, and issues related to collecting the WRF Facility Surcharges on the property tax rolls include:

- In many (but not all) cases, property owners own substantial equity in their homes, whereas many renters do not have such equity and/or may not be able to afford to purchase a home. Hence billing the WRF Facility Surcharges via the property tax rolls would put the burden on a group that generally has more financial asset than renters. At the same time, there are number of homeowners who – although they may have substantial equity in their home – are also living on fixed incomes.

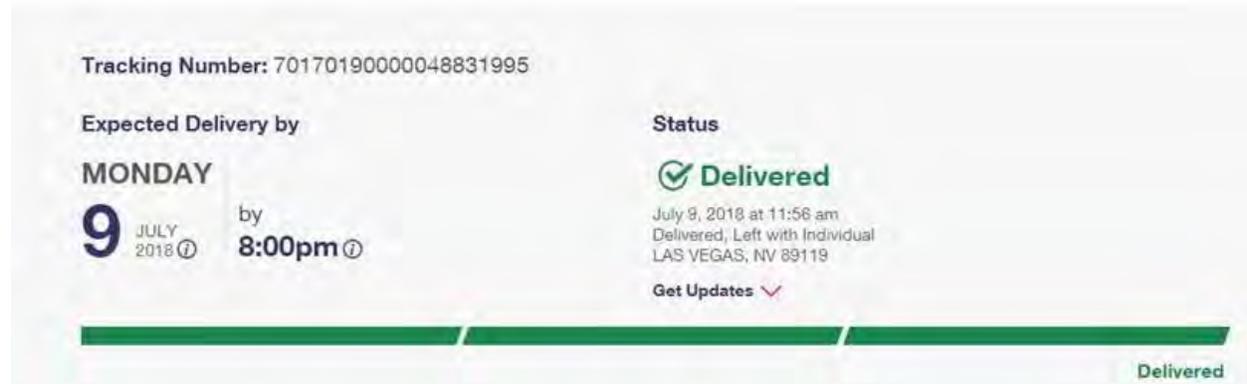

- The new WRF facility benefits homeowners by preserving property value with access to safe and reliable wastewater service.
- Adding the WRF Facility Surcharges to the combined monthly water and sewer bill could potentially result in an uptick in delinquencies. However, delinquencies can be ultimately recovered by placing a lien on the property, which results in the charge being put back on the property tax rolls in case of extreme delinquency.
- San Luis Obispo County is on the Teeter Plan and pays agencies for 100% of assessments or charges placed on the property tax rolls for collection, regardless of actual delinquencies. The County has indicated that if delinquencies exceed 3%, then the County retains the authority to end the Teeter Plan practice and instead provide only actual amounts collected. However, the County has never done this in the past.
- The cost of placing the surcharges on the property tax rolls currently costs \$2 per parcel and is roughly estimated to cost a total of about \$11,000 per year.
- Placing the surcharges on the tax roll would require the City Council to pass a Resolution adopting a schedule of charges to be levied on all affected properties by Assessor's Parcel Number (APN) each year. If the Resolution was not adopted, the charges could not be assessed on the property tax rolls. However, this does not mean that the City could not recover the charge, it would simply change the method of collection and would require the City to add the surcharges to the monthly bills instead.
- Regardless of the billing approach, the City would be under legal covenant to adopt rates and charges as needed to repay debt service, meet debt service coverage requirements, and meet other legal obligations.
- Collecting sewer charges on the property tax rolls would also result in a change in timing of receiving revenues. The County generally sends agencies payments twice per year (in December and April) based on actual tax collections. Subsequently, at the end of the fiscal year, the County does a true-up and would send the City the remainder of amounts billed on the tax rolls regardless of delinquencies. The County subsequently deals with the delinquencies and keeps any funds recovered from the delinquent properties including any penalties.
- If the City opted to collect the WRF Facility Surcharges on the property tax rolls, due to the change in timing of revenues, the City may need to strategically determine the payment dates for future debt service payments to ensure the debt payments are due after the City receives payment from the County in December and April.

In order to recover the WRF Facility Surcharges via the property tax rolls, the City would need to follow the process identified in the California Health and Safety Code Section 5470 – 5474, attached as an appendix to this report. The process is similar to the Proposition 218 process required for increasing utility rates and could be done concurrently when the City goes through the Proposition 218 rate increase process for potential water and sewer rate increases.

## OTHER. NON-REFUNDABLE APPLICATION FEE

The City of Morro Bay has paid the \$25,000 application fee required for projects serving small communities with a population of not more than 25,000 people. The City mailed a check for \$25,000 on July 5, 2018 to the US EPA Las Vegas Finance Center. It was received on July 9, 2018. This exhibit includes documentation of payment.
