- Fine bubble diffusion for aeration basins with blowers independent of the MBR blowers
- Scouring system for MBR basins
- Mixing system for anoxic basins
- Chemical addition systems, as needed
- DO probes in each aeration basin (minimum of three), tied to SCADA
- Level indicators in each basin, tied to SCADA
- Complete clean in place (CIP) system to be furnished
- RO Permeate will be used for CIP
- Absolute and pro-rated warranty, along with Fiber Breakage Warranty
- Roofing system for protection from weather and UV degradation
- Bridge crane system for lifting cassette modules for maintenance

|----|-------|-----------------------------------------------------------------------------------------|--|

**2.7 Aerobic Sludge Digester**

The Aerobic Sludge Digester will receive, store, aerate, and digest activated sludge wasted from the MBR process. Minimize freeboard/head space in Aerobic Sludge Digester to reduce potential for odor accumulation. Provide a system that allows for installation of a future cover and connection to odor control.

**2.8 Sludge Dewatering**

The Sludge Dewatering System will pump waste sludge from the Aerobic Sludge Digester, or directly from the MBR system, and perform dewatering to remove water and increase total solids concentration. Pumps, conveyance, polymer storage and feed system, and dewatering systems to be provided by the same manufacturer. Design the pumping, conveyance, and dewatering system to convey solids from dewatering equipment to rolloff container with minimal exposure for odor release. Design system to allow waste activated sludge to bypass the Aerobic Sludge Digester and be pumped directly to Sludge Dewatering System. Minimize the distance and lift between the Aerobic Sludge Digester, dewatering equipment, and rolloff container. Provide a design that achieves even distribution of dewatered sludge from conveyor into dumpster, such as Dumpster-veyor or equal, and tied to SCADA. Provide polymer storage and feed system to achieve required solids concentration. The Dewatering Building shall comply with the structural and architectural performance criteria specified in Sections 3 and 4.

**2.9 Reverse Osmosis**

The Reverse Osmosis (RO) System will receive water from the MBR System. The RO System shall be housed within a building, together with the UVAOP System. The Advanced Treatment Building shall comply with the structural and architectural performance criteria specified in Sections 3 and 4.

|---|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Minimum Capacity         | Minimum Daily Flow (0.67 MGD)                                                                                                                                                                                                                                                               | Example flow rate shown in parentheses. DB to determine design flow                                                                                                                                            |
| 3 | RO Train Flush System    | A Flush Tank and pump(s) shall be provided to allow for complete flushing of all RO Trains upon sequential plant shutdown with RO permeate. In addition, Tank shall be sized, at a minimum, to allow for flushing all stages without a sequential plant shutdown (e.g. Emergency Shutdown). | <ul style="list-style-type: none"> <li>• DB to incorporate gravity flushing during emergency shutdowns, if possible</li> <li>• Flushing with RO permeate minimizes biogrowth during shutdown period</li> </ul> |
| 4 | Sample Taps              | Each RO Train to be equipped with suitable sample taps for feed, concentrate and permeate lines. Each individual RO vessel must be equipped with a permeate sample tap. Route all sample taps to a common panel with a trough connected to a drain.                                         |                                                                                                                                                                                                                |
| 5 | Off Spec Water Discharge | Provide piping and valving to allow for off spec product water to be discharged to the ocean outfall or Flow Equalization Basin during start-up and normal operation                                                                                                                        |                                                                                                                                                                                                                |
| 6 | Flow Equalization        | Provide concrete tank for flow equalization upstream of RO System to allow for steady flow to the RO System                                                                                                                                                                                 |                                                                                                                                                                                                                |

**2.10 Ultraviolet Advanced Oxidation Process (UVAOP)**

The Ultraviolet Advanced Oxidation Process (UVAOP) System will receive water from the Reverse Osmosis (RO) system, or directly from the MBR System. UVAOP System to be capable of disinfecting MBR product water for disinfection prior to ocean outfall, and capable of providing final treatment for Indirect Potable Reuse. The UVAOP system shall be provided by a single system supplier and shall be installed in the same building as the RO System. The Advanced Treatment Building shall comply with the structural and architectural performance criteria specified in Sections 3 and 4.

| Item | Parameter     | Criteria                       | Notes |
|------|---------------|--------------------------------|-------|
| 1    | UV Technology | Low pressure, high output lamp |       |
| 2    | Oxidant       | Hydrogen Peroxide              |       |

|    |                                    |                                                                                                                                                                                                                                                                                     |                                                                                                                 |
|----|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|

| 4  | Standby capacity                   | 100%                                                                                                                                                                                                                                                                                |                                                                                                                 |
| 5  | UV Reactor Type                    | Closed vessel                                                                                                                                                                                                                                                                       |                                                                                                                 |
| 6  | Minimum Number of Treatment Trains | 2                                                                                                                                                                                                                                                                                   | Provide a minimum of 2 trains with N+1 redundancy                                                               |
| 7  | UV Treatment Train Capacity, Each  | Equalized Peak Day Flow (2.75 MGD), minimum                                                                                                                                                                                                                                         | Meet equalized Peak Day Flow, at a minimum. Example flow rate shown in parentheses. DB to determine final flow. |
| 8  | UV Reactor Materials               | 316L Stainless Steel                                                                                                                                                                                                                                                                |                                                                                                                 |
| 9  | Ancillary Equipment                | Each treatment train shall be provided with magnetic type flowmeters and motorized isolation valves. Provide all necessary equipment for periodic chemical cleaning of UV reactor. Provide access platform for ease of operation and maintenance, per manufacturer recommendations. |                                                                                                                 |
| 10 | Sample Taps                        | Provide sample taps on each train to allow for adequate performance monitoring. Route all sample taps to a common panel with a trough connected to a drain to the WRF Plant Drain System.                                                                                           |                                                                                                                 |
| 11 | 1,4-Dioxane Reduction              | 0.5 log                                                                                                                                                                                                                                                                             |                                                                                                                 |
| 12 | Product Water Quality Requirements | Meet Recycled Water Requirements in Waste Discharge Order, CCR Title 22 for GRRP subsurface injection                                                                                                                                                                               |                                                                                                                 |
| 13 | Off Spec Water Discharge           | Provide piping and valving to allow for off spec product water to be discharged to the ocean outfall or Flow Equalization Basin during start-up and normal operation                                                                                                                |                                                                                                                 |

**2.11 Chemical Storage and Feed Facilities**

The following section includes the performance criteria associated with chemical storage and feed facilities of the WRF.

| Item                    | Parameter                                               | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Notes                                                                          |

In the event of conflict, the more stringent shall prevail.</li> </ul> |

**2.13 Effluent Pump Station**

The Effluent Pump Station will convey reverse osmosis concentrate discharge, bypass flows, and treated effluent that exceeds injection capacity and/or does not meet specification for groundwater injection to the ocean outfall. The Effluent Pump Station may be co-located with the Recycled Water Pump Station and shall be housed in a building, which shall meet the structural and architectural performance criteria specified in Sections 3 and 4.

**2.14 Recycled Water Pump Station**

The Recycled Water Pump Station will convey recycled water to injection wells located in the Morro Valley. Include provisions in the design and construction to allow for sodium hypochlorite addition in the future, in the case that the City desires it for recycled water pipeline maintenance. At a minimum these provisions should include space for chemical storage, feed system, and controls, and the pipeline alignment should provide a location for easy addition of chemical injection and mixing.

The Recycled Water Pump Station may be co-located with the Effluent Pump Station and shall be housed in a building, which shall meet the structural and architectural performance criteria specified in Sections 3 and 4.

**2.16 On-site Reclaimed Water System**

The On-site Reclaimed Water System shall be designed and constructed to provide for washdown, foam and scum control, screening/grit washing, landscape irrigation and any other suitable application. The on-Site Reclaimed Water System shall be designed to operate between 60 and 80 psi, adjusted as appropriate per final design as determined by the DB.

| Item | Parameter                    | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Notes                                                   |

| 1    | Design Approach              | <ul style="list-style-type: none"> <li>Design system as a loop.</li> <li>Provide isolation valves at all tee fittings on each downstream piping</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Pipe materials per Section 7 Mechanical Piping Criteria |
| 2    | On-site Reclaimed Water Uses | Washdown, foam and scum control, screening/grit washing, landscaping, and other suitable applications to be determined by DB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                         |
| 3    | Washdown Areas               | <ul style="list-style-type: none"> <li>Provide cleaning/washdown areas for proper maintenance of treatment equipment.</li> <li>Clearly mark all reclaimed water hose racks and landscaped areas with signs complying with Title 22 requirements.</li> <li>Provide hoses w/ racks in locations allowing ease of access near walkways or platforms, sufficient for full coverage of process areas.</li> <li>Provide proper drainage and discharge of wash water so all wash water runoff is collected and discharged into the plant drain system and returned to headworks. Wash water runoff cannot enter the storm drainage collection system.</li> <li>Provide heavy duty 50-ft flexible hose and adjustable nozzles at each hose bib.</li> </ul> |                                                         |
| 4    | Pipe Sizing                  | Prepare and provide pipe capacity hydraulic calculations to demonstrate the proposed pipe sizes are adequate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                         |
| 5    | Water Demand                 | The reclaimed water system shall be able to supply the determined water demands at each point of connection while meeting the minimum and maximum pressure requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                         |
| 6    | Flow Meter                   | Provide a magnetic-type flow meter on the on-site reclaimed water system to record                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                         |

|  |  | total on-site demands. Tie to SCADA system. |  |
|--|--|---------------------------------------------|--|

**2.17 Vactor Washdown Area**

The Vactor Washdown Area shall be designed and constructed to provide a location for dumping sewage from the City’s vactor trucks. The Vactor Washdown Area shall be paved with curbs, and include two areas, each sized to allow washdown of a full vactor truck, with sloping concrete floors draining to a sump. The sump shall be connected to the plant drain system to transport materials to the headworks. Provide hoses and hose racks for washdown.

**SECTION 3 ARCHITECTURAL AND LANDSCAPING CRITERIA****3.1 General**

Provide a facility that is durable, low maintenance, and aesthetically compatible with the community. Provide buildings that meet the space needs as described herein. Architectural finishes are specified to provide an example of the quality and durability that the City desires. DB is encouraged to provide alternatives that offer comparable life-cycle cost value, while meeting or exceeding the performance criteria requirements.

**3.2 Applicable Codes**

All facilities provided shall comply with all the current building, fire, or other health and safety codes and regulations applicable to the project site including:

- California Building Code
- California Plumbing Code
- California Mechanical Code
- California Fire Code
- California Electrical Code
- California Building Energy Efficiency Standards
- California Green Building Standards Code
- California Coastal Zone Management Act

Note that the project site is currently located within a Moderate Fire Hazard Severity Zone in a State Responsibility Area and the provisions of CBC Chapter 7A apply. The project site is also located within a Coastal Zone and is located off of a designated State Scenic Highway. The provisions of the Coastal Zone Management Act and the local Coastal Zone Land Use Ordinance also apply.

**3.3 Buildings****3.3.1 Operations Building**

The Operations Building will serve as the administrative hub for the facility. It will be the location at which visitors to the facility check in when arriving at the facility. The entrance to the building should be apparent when approaching the facility. The rear entry to the building should be approachable by vehicles for staff and for pick up and return of samples to the sample storage rooms. The break room should be adjacent to an outdoor patio area of similar size for use by staff. The patio area should be shielded from view by an enclosure. The Operations Building shall be fully ADA accessible throughout.

**3.3.2 Maintenance Building**

The Maintenance Building will have a drive through bay for service vehicles. Coordinate height requirements with City. All roll up door jambs to be protected by concrete filled steel pipe bollards on the exterior. The bottom 48 inches of the shop and storage area walls shall be solid grout CMU or concrete on the interior. The lab should incorporate the City's existing lab equipment and provide sufficient counter top work surfaces to support the function of the lab. City will provide DB with list of existing equipment.

### **3.4 Aesthetic Design**

The building site will be visible from Highway 1, which is designated as a Scenic Corridor. Building forms and exterior materials shall be consistent with the character and themes described herein. Generally, the building forms used should be recognizably agricultural, using simple rectangular floor plates and gable roofs of varying slopes that reflect the use of the enclosed volumes. These building shapes are articulated where appropriate with clerestories or roof vents, again in familiar proportions. The orientation and relationship between roofs should maximize solar exposure and the potential future application of photovoltaics on the roof for power generation.

While individual buildings should reflect their use, the overall impression of the complex from the public right of way should be of a dairy farm or ranch. Colors should be muted off whites and earth tones on the buildings and roofs should be a soft terra cotta red or similar color.

Architectural design themes shall be approved by the City.

### **3.5 Exterior Materials**

#### **3.5.1 Walls**

Exterior wall finishes are to be durable, noncombustible, and perform well in the coastal environment such as exposed concrete, exposed CMU, metal siding, fiber cement siding, or plaster. There shall be no ferrous metal siding or wood exposed on the exterior of the structures.

Exposed concrete walls are to have reveals at control joints and at cold joints. See Structural requirements below for additional requirements for exposed concrete walls.

Masonry walls or veneer shall generally be integral colored split face where exposed to view. Precision block is not allowed where it is exposed to view. Control and expansion joints shall be located to control cracking. CMU walls or veneer shall conform to ACI 530. See also Structural requirements below for CMU walls.

Metal siding shall be aluminum shall have a minimum thickness of 0.040 inches and shall conform to ASTM B209. Siding shall have a high performance organic coating finish such as Kynar 500 and shall come with a manufacturer's 20-year warranty for watertightness, color fading, and chalking. Metal siding shall not be used within 48 inches of the finished grade.

Fiber cement siding, trim, and soffit materials shall conform to ASTM C1186 and shall be covered by a manufacturer's 30-year warranty. If panel siding is used it shall be finished with fiber cement battens at no more than 12 inches on center. If lap siding is used it shall have a maximum exposure of 7 inches. All trim is to be fiber cement.

Plaster shall conform to ASTM C296 and shall be installed over metal lath as part of a three coat system and shall have a smooth troweled 100% acrylic based finish. Lath shall conform to ASTM C847 and ASTM C1063. Casing beads, corner beads, expansion joints, control joints and other exposed lath accessories shall be aluminum or PVC. Control joints and reveals shall be located to minimize cracking. Fiber reinforced plaster systems may be used to reduce or minimize control and expansion joints following manufacturer's recommendations.

Weather barrier provided under any siding shall be a vapor permeable membrane, either spun polyolefin fabric or liquid applied. Weather barrier shall be approved by manufacturer for up to 210 days of weather exposure. All window, door, and other openings shall be flashed with a compatible system as recommended

by the weather barrier manufacturer. Grade D building paper is only acceptable as the second layer under a lath and plaster system.

### **3.5.2 Roof**

The roof is to be low maintenance and long lasting. The preferred roofing would be metal standing seam roofing where exposed to view. In other areas where a flat roof is not visible a single ply roof membrane would be acceptable.

Metal roofing shall be aluminum, shall have a minimum thickness of 0.040 inches, and shall conform to ASTM B209. Roofing shall have a high performance organic coating finish such as Kynar 500 and shall come with a manufacturer's 20-year warranty for water tightness, color fading, and chalking. Roof panels shall have a minimum seam height of 2 inches and installation shall follow manufacturer's recommendations to obtain the specified warranty.

Thermoplastic membrane roofing shall be a minimum of 80 mil and shall be UL Class A and shall conform with FM DS 1-28. Installation, including deck sheathing and insulation shall conform to manufacturer's recommendations. Provide a 20-year non-prorated warranty including materials and labor and not excluding ponding water or wind speeds less than 90 mph for the roof.

Roof accessories such as roof hatches, flashings, and gutters shall be aluminum. Roof hatches shall be thermally broken and shall be provided with a minimum of a 5-year warranty. Gutters shall be provided with means to prevent the accumulation of leaves and debris as required by CBC chapter 7A. Flashings and gutters shall have the same finish as the roofing.

### **3.5.3 Windows**

Windows shall comply with the requirements of the California's Title 24 and may be aluminum or fiberglass. Clear or minimally tinted glazing is preferred. Tempered glazing shall be provided where required. Windows shall comply with the performance requirements of AAMA and shall include a system for internal weep drainage and shall be thermally broken. Windows shall be fixed or operable hopper windows and shall not project past the inside face of the wall more than 4 inches. The On-Call room shall be provided with a window that complies with CBC 1030. All operable windows shall be provided with non-ferrous insect screens.

### **3.5.4 Louvers and Vents**

Louvers and vents shall comply with CBC chapter 7A and shall comply with ASTM E2886. Louvers and vents shall be aluminum or fiberglass.

### **3.5.5 Doors**

Exterior doors shall be molded fiberglass reinforced plastic and shall have fiberglass reinforced plastic frames with no metal or wood components. Accessories such as glazing stops and louvers shall be fiberglass. Doors and frames shall have an ultraviolet stabilized polyester, marine grade NPG-isophthalic, with low luster unpatterned final finish a minimum of 25 mils thick. Doors and frames shall have a manufacturer's standard 10-year warranty covering degradation or failure due to chemical attack.

Overhead coiling doors shall be capable of withstanding maximum positive and maximum negative wind loads as described in the California Building Code design criteria without undue deflection or damage to components. Doors shall be of standard construction for normal use of up to 20 cycles a day and an expected lifetime of a minimum of 50,000 operating cycles. Doors shall be insulated with a minimum R value of 8.0 and a STC rating of 22 for the entire door assembly. The steel curtain shall be minimum of 18 gauge on the exterior face. Guides and other exposed components shall be galvanized steel. Operation shall be manual via

a chain and shall lock with a slide bolt from the inside. Installation shall comply with manufacturer's recommendations. Shop doors shall have a minimum clear width of 14 feet and a clear height of 14 feet.

### **3.5.6 Exterior Steel**

Exterior steel items are generally to be avoided due to the highly corrosive coastal atmosphere however there are times when there is no suitable alternative, such as bollards to protect roll up door openings. When used in exterior applications all steel shall be hot dip galvanized, coated with an epoxy paint and then a finish paint. Assemblies shall be fabricated such that components can be joined together with slip jointed fittings or bolted together. Field welding of assemblies is to be avoided. If provided, exterior barrier and handrails shall be hot dip galvanized but are not generally required to be painted.

## **3.6 Interior Materials and Building Elements**

### **3.6.1 Walls**

Gypsum board walls shall be constructed following GA-216 with 5/8 inch board. Interior finishes, per ASTM C840, shall be level 3 in service areas and areas to receive a wall covering, level 4 in areas to receive a light textured finish and egg shell or matt paint (typical), and level 5 in areas to receive a semi-gloss finish. Mold resistant gypsum products shall be used within 10 feet of a sink or other plumbing fixture. Textured surfaces should receive a light to medium orange peel finish. Walls at offices shall be acoustically sealed at the floor and at penetrations in the wall. Where possible penetrations shall be staggered.

Tile on walls shall follow the Tile Council of North America (TCNA) recommended procedures for each application and substrate. Wall tiles shall be standard 4x4 ANSI A137.1 semi-gloss glazed wall tile. Tile on walls in toilet and shower rooms shall be a minimum of 7 feet tall and shall run continuously behind any applied fixtures such as mirrors. Utilize tiles with matching bead, bullnose, cove, and base shapes. Grout shall be polymer modified cement per ANSI A118.7. Provide waterproof membrane at all showers and within 24 inches of sinks.

Fiberglass reinforced paneling shall comply with ASTM D5319. Trim should be PVC in a color to match panel. Panels to be installed as per manufacturer's recommendations.

Insulation shall be installed at all interior partition walls for acoustics. Insulation shall fill the cavity space and shall comply with ASTM C665. Insulation shall be formaldehyde free.

Corner guards shall be provided on outside corners of walls unless covered in tile. Corner guards shall be stainless steel or vulcanized rubber consistent with ASTM F1861.

### **3.6.2 Ceilings**

Gypsum board ceilings shall be constructed following GA-216 with 5/8-inch board. Interior finishes, per ASTM C840, shall be level 3 in service areas and areas to receive a wall covering, level 4 in areas to receive a light textured finish and egg shell or matt paint (soffits), and level 5 in areas to receive a semi-gloss finish (toilets and showers). Mold resistant gypsum products shall be used within 10 feet of a shower. Textured surfaces should receive a light to medium orange-peel finish.

Acoustic tile ceilings and suspension systems shall comply with ASTM C635, ASTM 636, and ASTM E1264. Installation of grid shall conform to ASTM E580 for areas subject to earthquake ground motions and shall be heavy duty. Ceiling tiles shall be tegular and shall have minimum NRC of 0.75 and a CAC of at least 35.

### **3.6.3 Floors**

Polished concrete floors shall be consistent with the Retroplate system as a level of quality. Concrete floors shall be stained, utilizing a minimum of two colors. Concrete after treatment for polishing shall exhibit a uniform level of grind in each space or area. Final polish shall have a hard-shell satin finish (400 grit).

Sealed concrete shall be achieved with a liquid densifier hardener that penetrates into the concrete and reacts with the concrete to create a dustproof sealed finish.

Tile on floors shall follow TCNA recommended procedures for a full mortar bed application in a wet location. Floor tiles shall be ANSI A137.1 standard grade ceramic mosaic tile. Grout shall be polymer modified cement per ANSI A118.7 and shall be sealed with a water based colorless silicone. Provide waterproof cleavage membrane at all floors.

Wall base shall be consistent with ASTM F1861, Type TS vulcanized rubber a minimum of 4 inches tall and shall have a satin finish.

Underslab vapor barrier shall be provided continuously under all floor slabs and shall comply with ASTM E1745 Class A with a minimum thickness of 15 mils and a water vapor permeance of not more than 0.010 perms.

### **3.6.4 Doors**

Interior doors and frames shall be hollow metal and shall conform to SDI-100 standards for Level 2 heavy duty doors. Doors shall be full flush with a face gage of at least 18 and shall have an A60/ZF180 galvanized coating. Hollow metal door frames shall be full profile, continuously welded type with a minimum of 16-gauge steel. Doors and frames shall be rated as required by code.

At shower room provide removable fixed door and frame capable of being relocated without the use of any special tools to adjust the ratio of men's and women's shower stalls.

Access doors shall be provided where required to access plumbing or attic spaces. The minimum size of an access door shall be 12 inches by 12 inches. Access doors in drywall or plaster shall use a bead type frame. Access doors shall be factory fabricated doors and frame units with welded corners, filled and ground flush. Minimum thickness of frames shall be 16 gauge and of doors shall be 14 gauge. Doors located in wet areas or in tile shall be stainless steel. Doors shall be equipped with a latch with a screw driver slot to operate. Doors that are intended for the passage of a person shall have a latch that is operable from an interior space.

### **3.6.5 Casework**

Cabinets shall be constructed per AWI/WI standards for premium grade with Style A frameless construction with flush overlay door and drawer fronts. Millwork supplier shall furnish a W.I. certificate of compliance. Installer shall provide a Certified Seismic Installation Report confirming that acceptable backing is provided in all locations. Cabinet faces, doors, and exposed surfaces shall have NEMA LD 3 type high pressure laminate faces. Interior surface shall have a melamine finish. Doors and drawer fronts shall have a 3mm PVC edge. Pulls shall be closed wire loop type with a stainless steel finish. Drawer sides shall be commercial grade, side mounted. Drawer slides for drawers deeper than 6 inches shall be side mounted self-closing type with full extension. Hinges shall be stainless steel 5 knuckle 270-degree swing hospital type. Clear silencers shall be installed at each cabinet door.

### Countertops

Plastic laminate countertops shall be NEMA LD 3 type high pressure laminate with a minimum nominal thickness of 0.048 inches. Countertops shall have a front edge laminate built up to 1 ¼ inch thick with a raised radiused edge, integral coved backsplash and radiused top edge. The back and end splashes shall be of the same construction. Backsplash shall be a minimum of 4 inches tall. Exterior grade plywood backing shall be used at all wet locations. Provide backer sheet on underside of countertop substrate. No seams shall occur within 18 inches of a sink and sink cut outs shall be sealed.

### Lab Countertops

Solid epoxy resin countertops shall be used in the lab. The physical properties of the lab surface shall be consistent with Durcon epoxy resin countertops as a standard of quality. Countertops shall have a marine edge and shall be a minimum of 1 inches deep. Material shall be covered by a manufacturer's standard 10-year warranty to repair or replace any defective material at no cost to the City.

### **3.6.6** Hardware

Provide each type of door hardware from only one manufacturer. All hardware shall comply with provisions of CBC chapter 11B for accessibility. All doors to be commissioned prior to occupancy to assure that all the aforementioned requirements are met in the installed doors. All door hardware shall be satin finish stainless steel.

Locks and latches shall be provided for each door with appropriate function for the space. Locks shall be standard interchangeable core and shall utilize Schlage Everest 29 7 pin cylinders.

Hinges shall be stainless steel five-knuckle full mortise butt hinges. Provide non-removable pins and security studs at all exterior out-swinging doors. Hinges shall allow doors to open to maximum width. Provide ball-bearing hinges at all doors having closers.

Exit devices shall be push-through push-pad design and shall be independent lab tested to 1,000,000 cycles. No exposed push-pad fasteners, no exposed cavities when operated. Lever shall be breakaway type.

Closers shall be full rack-and-pinion type cylinder with removable non-ferrous cover and cast iron body and shall be independent lab tested to 1,000,000 cycles. Closer to have double heat-treated pinion shaft, single piece forged piston, and chrome-silicon steel spring. Closer to have separate adjusting valves for closing speed, latching speed and backcheck, fourth valve for delayed action where required. Exterior door closers shall have been tested to 100 hours of ASTM B117 salt spray test. Pressure Relief Valves (PRV) not permitted. Closers to be installed on each door that leads to the exterior. Doors from break room to exterior and from shop to exterior are to be equipped with a hold open function.

Gaskets are to be provided at each exterior door at top, sides, and meeting stile or pairs. At each exterior door provide door bottom sweep.

Protection plates are to be provided on the push side of each door equipped with a closer.

Floor stop, overhead stop, or wall protection bumper are to be provided for each door.

Thresholds shall be provided at all exterior doors and shall comply with CBC Chapter 11B.

Door silencers are to be provided at all doors not otherwise provided with gasketing.

### **3.6.7 Stretched Fabric Wall Panels**

Stretched fabric wall panels are to be provided in the break room and the conference room. Field installed, fabric is stretched and set into framework and laid over acoustic material anchored to substrate. Framework consists of continuous perimeter and intermediate mounting frames anchored to substrate, and designed to permit removal and replacement of fabric within framed areas without affecting adjacent areas. Installed system shall have a NRC of 0.70 minimum, when tested in accordance with ASTM C423, Type A mounting. Prefabricated, fabric covered and individually framed panels are not permitted. Fabric to be installed over acoustic material and into framework without use of adhesives, tapes, or fasteners. Seams in fabric are not permitted; base the frame layout dimensions on fabric at least 66-inch-wide. Fabric shall be class I per ASTM E84. Acoustic material shall be 100% polyester with zero volatile organic compounds or formaldehyde.

### **3.6.8 Marker Boards**

Marker boards shall be provided as indicated on the room forms. Marker boards to be porcelain enamel on minimum 24 gauge steel, laminated to core. Frame to be extruded aluminum with concealed fasteners and corner guards. Each markerboard shall include a full-length aluminum tray. Markerboard to be covered by manufacturer's 20-year warranty against discoloration due to cleaning, crazing or cracking, and staining.

### **3.6.9 Signage**

Signage for identification and wayfinding shall be provided. Signage shall be visible at the entrance road to the facility and another sign shall be visible at the exterior of the building. Entry and building identification signage shall be free standing.

Signage for room identification shall be provided at the facility to identify each space at each door. Space identification signage shall comply with CBC Chapter 11B, Division 7. Signs shall be of engraved construction on fiberglass (exterior) or melamine (interior) plastic. Acrylic and photopolymer substrate are not acceptable.

Signage for parking stalls as required by CBC Chapter 11B shall conform to the requirements of the code.

### **3.6.10 Toilet Compartments**

Toilet compartments shall be provided as described on plans or as required. Partition configurations shall comply with the requirements of CBC Chapter 11B. Partitions may be HDPE or solid phenolic. All hardware shall be aluminum or stainless steel. Partitions shall be overhead braced.

### **3.6.11 Toilet, Bath, and Laundry Accessories**

Toilet, bath, and laundry accessories shall be manufactured by a company specializing in the manufacture of such accessories with a minimum of 10 years' experience. All accessories shall be ASTM A666 type 304 stainless steel with a number 4 brushed finish.

Accessories to be provided include:

Toilet Paper Dispensers: Two roll capacity

Paper Towel Dispensers: Fan fold

Electric Hand Dryers: High velocity capable or drying hands in 12 seconds

Soap Dispensers: liquid

Mirrors: Stainless steel framed, full height at locker rooms, 18 by 36 inches at each lavatory.

Seat Cover Dispensers

Grab Bars: Satin finish, concealed fasteners

Sanitary Napkin Disposal Units

- Utility Shelf with Mop and Broom Holder
- Shower Rods
- Shower Curtains
- Robe Hooks
- Flip up Shower Seat at Fully Accessible Shower Stalls

### **3.6.12 Lockers**

Lockers at shower rooms shall be HDPE with antimicrobial additive tested per JIS Z2801 to be greater than 4.0 efficacy rating. Lockers shall be single tier a minimum of 15 inches wide by 18 inches deep and 72 inches tall. Lockers shall have sloped tops, shall be fully ventilated, standard hasps, and shall include a stainless steel coat rod. Lockers shall be placed on a raised concrete curb with a tiled face.

Lockers for gear and personal equipment storage shall be HDPE with antimicrobial additive tested per JIS Z2801 to be greater than 4.0 efficacy rating. Lockers shall be single tier a minimum of 24 inches wide by 24 inches deep and 72 inches tall. Lockers shall have sloped tops, shall be fully ventilated, standard hasps, and shall include a stainless steel coat rod.

### **3.6.13 Fire Protection Specialties**

Fire extinguishers shall be provided as required by code and shall comply with NFPA 10. Extinguishers may be surface mounted.

### **3.6.14 Residential Equipment**

Residential equipment shall be provided as shown on conceptual layouts and described herein. Finishes shall be stainless steel or similar color painted finish at washer and dryer.

#### Microwaves

- Countertop style
- 1000 watt minimum
- 1.1 cubic foot minimum

#### Range

- Size: 30 inches
- Capacity: Minimum of 5.0 cubic foot
- Type: Electric radiant heat elements with porcelain top
- Controls to be mounted on front surface of range

#### Refrigerator

- Energy Star rated
- Bottom freezer
- Ice maker
- LED lighting
- Ice/water filter
- Interior filtered water dispenser no higher than 48 inches to controls
- Minimum capacity 24.5 cubic feet

#### Hood

- Wall mounted standard range hood
- 2-speed fan
- 180 CFM minimum at high
- 4.5 Sones maximum at low speed
- Filters: Washable grease
- Ducted to exterior via 7" diameter duct

- Provide remote switches for fan within reach range
- Dishwasher
  - Energy Star rated
  - Internal water heater
- Washer
  - Energy Star qualified
  - Front loading
  - Minimum capacity of 4.5 cubic feet
- Dryer
  - Electric
  - Controls located on the front face
  - Dryer and Washer to be a matched set by the same manufacturer

### **3.6.15 Furnishings**

Furnishings shall be provided in all spaces to support the intended use of the room. Including desks, tables, chairs, work benches, lab benches, and other office furnishings equipment to support the intended use of the room and as described.

Shop and storage areas shall be provided with work benches, storage cabinets, storage shelves, a work sink, a compressor and permanently mounted compressed air lines with quick connect couplings compatible with the City's existing tools and equipment. The DB shall coordinate with City for relocation and reuse of any existing equipment.

Bridge crane shall be provided at shop for use in drive through bay. Crane shall be overhead supported with a capacity of 4 tons minimum. Controls shall be located on pendant suspended from sliding track. Crane clearance shall be a minimum of 14 feet with a minimum hoist lift of 10 feet. Bridge, trolley, and hoist shall be electrically controlled at pendant. Bridge and trolley motors shall be variable frequency drive with sealed dust-proof brakes. Crane shall be protected from overload with weight limit switches and limit switches to prevent running crane beyond its boundaries Crane shall be fully compliant with OSHA standard 1910.179.

Lab area shall be furnished with all cabinetry and ventilation systems to provide an efficient and effective working area. The DB shall coordinate the relocation and reuse of existing City laboratory equipment necessary to perform the on-site sample analysis required for compliance with all applicable agencies and process control. An eyewash/shower station shall be provided near the Lab and Shop.

### **3.6.16 Fire Protection System**

Fire Sprinkler system shall be provided as required by CBC and shall include everything required for a complete system including underground supply lines, backflow preventer, fire department connection, and valve tamper switches tied into fire alarm system. All equipment shall be in compliance with NFPA #13 standards. Furnish and install signs as required. Sprinkler heads shall be aligned with ceiling components.

For electrical supply rooms the fire sprinkler system provided shall be a double interlocking preaction system. This system shall consist of a dry pipe valve and a pre-action valve. To activate water flow, both the preaction valve must be activated by the supplemental detection system and the sprinklers must activate. The system shall be NFPA approved.

For computer and communication rooms the fire protection system must be a waterless system approved for use with sensitive computer equipment. The system shall be fully self-contained with cylinders and control panel located within the room. The system must include a warning alarm that the system is pending activation. The system shall be NFPA approved.

The fire alarm shall simultaneously contact the fire department and announce in the operations control room when any alarm is activated.

### **3.6.17 Domestic Plumbing**

Plumbing systems shall be complete as required by CBC. Toilet and restroom fixtures (toilets, lavatories, urinals) shall be vitreous china. Sinks shall be stainless steel. Showers shall be furnished with single piece terrazzo shower receptors including at fully ADA compliant shower provided for each locker room. Water in recessed box shall be provided for ice maker at break room. Floor drains with automatic trap primers shall be provided in all restrooms and locker rooms. Provide water hammer arrestors as needed. Provide key operated hose bibs on each accessible face of buildings. Provide hot water supply sufficient for each building's needs including lab and shop sinks. Provide telephone shower near staff entry to Operations Building for wash down of boots or protective clothing. Wash down shower to be connected to the sanitary sewer and protected from storm water.

Waste, vent, sewer and storm lines shall be of cast iron soil pipe and fittings and shall conform to the requirements of CISPI Standard 301, ASTM A-888 or ASTM A-74 for all pipe and fittings.

### **Domestic Water Service**

Below grade (water service) shall be as follows:

- 3" NPS and smaller: Schedule 40 PVC Plastic Pipe and fittings. ASTM D1785, D2466, with Solvent Cement Joints ASTM D2564.
- 2" NPS and smaller: Type K Soft Annealed Temper Copper Tube ASTM B88 with wrought copper pressure fittings, ANSI B16.22. SIL-FOS - High Temperature Brazing Metal Filler.

Above grade (distribution system) shall be as follows:

- Pipe: For soldered, brazed and mechanical joints, 4" and smaller Copper Water Tube Type L Annealed Temper (Hard Drawn) ASTM B75 or ASTM B88. All underground water piping within the building boundaries shall be ASTM B88-93a Type "L" annealed (soft) copper tube made up without fittings below the floor level.
- Fittings: Wrought copper pressure solder fittings, ASME B16.22 or ASME B16-25,95-5 Tin-Antimony Filler Metal.

### **3.6.1 Heating Ventilation and Air Conditioning**

Heating ventilation and air conditioning systems shall be in conformance with CBC/Title 24 requirements. All regularly occupied spaces in the Operations Building shall be provided with both heat and air conditioning. Shop support spaces and Lab shall be provided with heat and ventilation. Shop shall be provided with provision for radiant heaters to be installed at some time in the future at work areas.

Sheet Metal Ductwork including Rectangular supply, return, outside air and exhaust ducts, single leaf dampers and plenums shall be fabricated from prime grade galvanized steel sheets of lock form quality and shall be constructed in accordance with appropriate tables of the latest ASHRAE "Guide and Data Book" and SMACNA "HVAC Duct Construction Standards" handbook and Chapter 6 of the California Mechanical Code, current edition. Each duct or plenum shall be diagonally cross-braced for rigidity.

**3.6.1.1 Flexible Ductwork**

Flexible ductwork shall consist of an inner core having two layers of polyester film encapsulating a steel wire helix surrounded by a blanket of fiberglass insulation and sheathed in a metalized polyester vapor barrier reinforced with fiberglass scrim. All air ducts shall be UL listed under the UL-181 standard as a Class 1 Air Duct also conforming to NFPA standards 90A and 90B. This air duct shall have a certified thermal resistance rating of R-8 in accordance with ASTM C518 at 75 degrees F and carry the ADC "Thermal Performance" seal. Use only the minimum length required to make the connection. In no case shall any section of flexible duct exceed 7 feet in length. The number of bends shall not exceed a combined total of 90 degrees. 90-degree bends will not be allowed at diffuser connections.

**3.6.1.2 Damper Regulators and Bearings**

Lever type with matching end bearing. Regulator set shall include rubber gasket between regulator and duct, spring washer between core and housing, wedge pin, dial indicator and handle. Matching end bearing shall be closed end with rubber gasket.

**3.6.1.3 Access Panels**

Access panels shall be located at all points where adjustable mechanisms are installed internal to or on the surfaces of the ductwork. Where adjustable mechanisms are concealed by walls or ceilings, access doors shall be installed. Size shall be suitable for convenient servicing.

**3.6.1.4 Fire Dampers**

Fire dampers shall be installed where required, and shall be of a type approved by the U.L. Laboratories, Inc. and the State of California Fire Marshal. Dampers shall be installed per manufacturer's instructions. Provide access door in duct at each fire damper such that damper is easily accessible.

**3.6.1.5 Volume Dampers**

- Rectangular ducts greater than 1.5 sq. ft.: Provide factory fabricated opposed blade damper, 16 gauge blades, and brass bearings. Blade width shall not exceed six inches.
- Rectangular ducts 1.5 sq. ft. and less: Provide single leaf dampers as described.
- Round ducts 15" in diameter and less: Provide shop fabricated galvanized sheet metal plate dampers. Plate shall be 18 gauge or shall be two even gauges heavier than duct; minimum thickness 22 gauge. Provide stiffening beads at 1/3 points in dampers lighter than 18 gauge.
- Round ducts 16" and greater: Provide opposed blade damper.
- Round ducts 4" – 24" in diameter above "hard" ceilings: Provide cable operated damper. Cable length to be between 3 and 15 FT long.

**3.6.1.6 Flexible Connections**

Provide fireproof, insulated, non-porous, flexible connections between fans and ducts or casings and where ducts are of dissimilar metals. For round ducts, securely fasten flexible connections by zinc coated steel clinch-type drawbands. Provide a duct support next to each flex connector to prevent any strain on connection.

**3.6.1.7 Condensate Drains and Drain Pans**

- Air conditioning cooling coils shall have a condensate drain pipe, type "M" copper, to drain the condensate.
- Fan coils or DX cooling coils located in an attic or furred space shall have a secondary drain pan constructed of 20 gauge galvanized steel sheet metal. This pan shall have a drain line discharging to a conspicuous location. This pan and drain is in addition to the normal condensate drain line from the coil.

**3.6.1.8 Motor Starters**

Motor starters shall be provided complete with properly sized thermal overload protection and other appurtenances necessary for motor control. Mount starter adjacent to equipment. Maintain minimum of 3' clearance to front of devices. Motor starters shall be NEMA I or III as appropriate, general purpose, weather-resistant, with watertight enclosure where required.

**3.6.1.9 Insulation**

Insulation of heating and cooling ducts shall conform to requirements of CMC. Insulation shall be installed after the required tests have been applied to the piping and duct systems, and the systems have been inspected and approved.

**3.6.1.10 Temperature Controls**

Temperature controls shall be provided for zones with similar use, loads and exposure. Thermostats shall be capable of 7 day programming and shall incorporate a minimum 5 degree deadband.

**3.6.1.11 Labeling**

Labels shall be provided for all equipment and switches. Labels shall be 2" x 1" x 1/8" thick plastic engraving stock beveled on both sides and with two 3/16" diameter holes near the top uppermost tag corners. Labels shall be white with 3/8" high red engraved letters. Labels shall be attached to the equipment with adhesive or screws.

**3.6.1.12 Mechanical Systems Balancing**

Mechanical systems balancing shall be performed by an independent balancing company certified by Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB). Testing and balancing shall be performed by a company other than the mechanical system installers/contractor. Upon completion of the balancing operation and prior to final acceptance of the systems, the balancing firm shall submit an Air Side Report certifying to the proper performance of the system for approval by the City.

**Air Side Report**

The following information shall be included in the Air Side Report:

- Fan speeds.
- Motor current readings and voltage readings.
- Air quantities in CFM at supply, return, exhaust terminals, and outside air intakes, both at design value and actual measured value. Test and adjust each terminal to within +10% of design requirements.

- Air velocities in FPM at supply, return, and exhaust terminals at design value and actual measured value.
- Positive static pressure, negative and total pressures and total air quantities for each fan system.
- Equipment nameplate data.

### **3.6.2 Electrical and Lighting**

Electrical and Lighting systems shall be in conformance with CBC/Title 24 requirements.

Lighting shall meet IES recommended levels for each space and use. All lighting fixtures to be manufactured by a company with a minimum of 10 years' experience. Interior lighting controls (daylighting and occupancy sensors) shall be produced by the same manufacturer as light fixtures. All light fixtures shall be independently tested to verify manufacturer's listed light levels. All exterior light fixtures shall be housed in non-ferrous housings with stainless steel fittings. All exterior light fixtures shall be full cut off. Exterior lighting shall be provided with dual light levels and controls to allow light levels to be dropped to minimum levels when the facility is not actively occupied.

Power shall be provided as required for the intended use of each space and as required by code. Power outlets controlled by switches shall be identified with permanent labels or color-coded outlets. Three phase power shall be provided in shop area for anticipated service equipment. Power outlets shall be provided for wall mounted display screens.

### **3.6.3 Telecommunication Systems**

Telecommunication system shall be provided as required for the anticipated use of each space including voice and data communications. Each workstation or office shall be provided with a minimum of four data outlets. Data outlets shall also be provided for provision of Wi-Fi access points, printers, security cameras, and the SCADA system. All materials shall be UL Listed and shall be marked as such. If UL has no published standards for a particular item, then other national independent testing standards shall apply and such items shall bear those labels. Where UL has an applicable system listing and label, the entire system shall be so labeled. All modular jacks, patch cords, consolidation point, and patch cords performance shall be verified (not just tested) by a third party to be category 6 component and channel compliant. All data outlets shall be permanently labeled with a printed label identifying the outlet.

Telecommunications cabling shall adhere to the current version of the following standards

- ANSI/TIA/EIA - 568-C.0, Generic Telecommunications Cabling for Customer Premises
- ANSI/TIA/EIA - 568-C.1, Commercial Building Telecommunications Cabling Standard.
- ANSI/TIA/EIA - 568-C.2, Balanced Twisted Pair Cabling Components, Addendum 1 –
- ANSI/TIA/EIA - 568-C.3, Optical Fiber Cabling Components
- ANSI/TIA/EIA – 569-A, Commercial Building Standard for Telecommunications Pathways and Spaces
- ANSI/TIA/EIA – 606-A, Administration Standard for Telecommunications Infrastructure of Commercial Buildings
- ANSI/TIA/EIA – 607-A, Commercial Building Grounding and Bonding Requirements for Telecommunications
- ANSI/ TIA/EIA – 758, Customer-Owned Outside Plant Telecommunications Cabling Standard
- BICSI - TDMM, Building Industries Consulting Services International, Telecommunications Distribution Methods Manual (TDMM)
- National Fire Protection Agency (NFPA – 70)

California Electrical Code

### **3.7 Plantings**

Planting shall be provided to enhance the visual appeal of the entrance to the facility and around the public areas of the Operations building and to provide a screening buffer for the neighboring property to the east.

#### **3.7.1 Visual Aesthetic**

The project landscaping shall generally serve to enhance the visual corridor of the entrance to the site and provide a screening buffer for the neighboring property to the east. Plants shall be grouped in masses to appeal to the aesthetics as viewed at vehicular speeds. The overall plant palette does not require more than 10 to 15 plant species to convey the aesthetic.

#### **3.7.2 Drought Tolerance**

Landscaping shall primarily comprise of heavily drought tolerant species suitable for the coastal exposure. A good target percentage for the landscape palette is 80% drought tolerant low water using plants (based on WUCOLS standards), and 20% moderate water using plant material.

#### **3.7.3 Plant Sizes**

As a general rule of thumb, the following guidelines are provided for container sizes:

- Shrub: 1-gallon size minimum. 40% of plant material shall be upsized to a minimum of 5 gallon.
- Trees: 15-gallon size minimum. 50% of plant material shall be upsized to a minimum of 24" box. Trees intended to provide shade, or with slow growing habits shall be considered for upsizing first.
- Ground cover: 1-gallon size minimum. Large spreading groundcovers (5-6 ft on center spacing minimum) shall be 5-gallon size minimum.

#### **3.7.4 Planter Mulch**

All landscape areas shall be dressed with a non-combustive, weed free, organic mulch. No eucalyptus material is acceptable. The mulch shall be installed in a 3" minimum layer.

#### **3.7.5 Plant Layout**

Plant material shall be designed and located such that larger/taller plant material creates a backdrop for shorter lower growing plant material in the foreground. Accent plant material is encouraged at focal points like street intersections, and entry ways. Plant material shall be spaced at  $\frac{3}{4}$  of anticipated full spread. This will avoid large void spaces between plant material and allow plants to fill in quicker.

#### **3.7.6 Soil Preparation**

Soils shall be amended per the requirements of the State or local Model Water Efficient Landscape Ordinance. Soil samples shall be taken and tested for fertility. Soil amendments shall conform to the requirements obtained through this testing. Where soils are non-conductive to plant life, due to heavy thick clay, contaminants or rock, the top 6" of existing soils in planted areas shall be exported off site and topsoil imported. Topsoil shall conform to SSPWC standards for Grade A topsoil.

**3.7.7 Plant Establishment**

An establishment period of 90 days (minimum) shall be required for initial maintenance and warranty of plant material. Site observation meetings shall be scheduled at 30-day intervals to observe plant material. Repairs shall be provided on an ongoing basis.

**3.7.8 Plant Warranty**

The installer shall warranty all trees for a minimum of 1 year. All shrubs shall be warranted for a minimum of 30 days beyond the completion of the establishment period.

**3.8 Irrigation**

Irrigation System shall comprise of equipment selected from manufacturer's having been in the business a minimum of 15 years and have a good track record of long lasting equipment. Equipment shall be comprised of components designed to perform with high water efficiency.

**3.8.1 Irrigation Emission Devices**

- The following guidelines are provided for the design/implementation of the irrigation system.
- Large slopes – Low flow rotors or rotary nozzles shall be utilized to keep runoff down. Dripline is discouraged in this application.
- Large landscape areas – Low flow rotors or rotary nozzles shall be utilized. Drip may be utilized if approved by City.
- Small and Linear planters – Low flow rotary nozzles or drip irrigation shall be utilized. Drip may be required when parkway planter sizes are less than 10 ft in width.

**3.8.2 Piping**

PVC pipe shall be SCH 40 minimum. Do not use pipe sizes less than ¾" for laterals. Mainlines should have a minimum size of 1½".

**3.8.3 Remote Control Valves**

Utilize brass globe valves intended for dirty water use.

**3.8.4 Ball Valves**

Bronze or brass, not plastic. Locate along mainline periodically and at crossings to allow for mainline shut off for maintenance.

**3.8.5 Valve Boxes**

Shall be locking. Purple where dirty water is in use.

**3.8.6 Controller**

Weather based controller capable of adjusting runtimes based on live input data and historical data. Shall have ports for a master valve, flow sensor, rain sensor/moisture sensor. Shall have minimum 48 stations to allow for future expansion. 2 wire is acceptable.

**3.8.7 Flow Sensor**

Manufactured by same company as the controller. Shall be able to read high and low flows of the design system.

**3.8.8 Master Valve**

Brass normally closed valve intended for dirty water use.

**3.8.9 Quick Couplers**

Locate periodically for maintenance purposes. Dirty water compatible.

**3.9 Decorative Fences and Gates**

Decorative fences and gates shall be provided at the public face of the facility facing Highway 1. Fence shall be capable of resisting vertical load, horizontal load and infill performance requirements for fence categories defined in ASTM F2408. Fence shall be hot dip galvanized steel, epoxy primed, and painted with a total minimum coating thickness of 2 mils. Fence shall be assembled from panels joined to posts, with no field welding. Gates to be lockable in both the open and closed position. Spacing between pickets shall result in a clear space between them of not more than 4 inches.

**3.10 Space Needs**

See Appendix E for a summary of space needs of the Operations and Maintenance Buildings.

**3.11 Space Needs Identification Forms**

See Appendix G for Space Needs Identification Forms with specific requirements for the rooms identified.

**3.12 Equipment and Furniture List**

See Appendix H for an equipment and furniture list for rooms identified.

**3.13 Landscape Plan**

See Appendix I for a conceptual landscape plan of the front entry and access road.

**SECTION 4 STRUCTURAL CRITERIA**

**4.1 General**

All structural design shall be prepared under the direct supervision of a Structural Engineer licensed by the State of California. Design all structures for a service life of not less than 50 years, in accordance with the most current applicable codes and standards.

The structural criteria presented in this section define the general requirements. Variation from any standards shall be identified in a report and provided to the City for consideration. City acceptance shall be obtained prior to implementing such variations, and shall be provided at the sole discretion of the City.

**4.2 Load and Deflection**

| Item | Parameter  | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Notes |
|------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Loads      | All loads to structures and components shall be developed with the latest version of the ASCE 7 referenced by the CBC                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |
| 2    | Live Loads | <ul style="list-style-type: none"> <li>• Conform to ASCE-7 with traffic loads per AASHTO.</li> <li>• Use minimum live loads for structures that will allow equipment to be moved to other locations or additional equipment to be added.</li> <li>• Floor live loads in equipment rooms, pump rooms, electrical rooms and areas where equipment may be moved to various locations shall be not less than those given in ASCE-7 for light manufacturing: 150 pounds per square foot uniform load and 2,000 pound concentrated load.</li> <li>• Where the loads of specific equipment give higher design forces and stress for a specific area, the higher loading shall be used. No live load reduction may be used.</li> <li>• For heavy equipment greater than five tons, floor live loads shall be designed for the greater of 250 pounds per square foot uniform load or the load of the specific equipment.</li> </ul> |       |
| 3    | Wind Loads | ASCE-7 wind load design forces and wind load detailing requirements shall apply for all buildings, equipment anchorage, and hydraulic or water-holding structures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |       |

|   |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                       |
|---|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| 4 | Seismic Loads | <ul style="list-style-type: none"> <li>• ASCE 7 seismic load design forces and seismic load detailing requirements shall apply for all buildings, equipment anchorage, and hydraulic or water-holding structures</li> <li>• All structures and components shall be designed with the values below:                         <ul style="list-style-type: none"> <li>○ Latitude = 35.3707</li> <li>○ Longitude = -120.8217</li> <li>○ Site Class = C</li> <li>○ <math>S_s = 1.135</math></li> <li>○ <math>S_1 = 0.421</math></li> <li>○ Importance Factor = 1.25</li> <li>○ Component Importance = 1.0 to 1.5</li> </ul> </li> </ul> | Refer to Geotechnical Baseline Report |
| 5 | Deflection    | <p>Serviceability design shall ensure against deflections causing adverse functional or aesthetic effects over the life of the plant. The live load and total load deflections criteria given in the CBC for general loading combination and specific to the various design material (concrete, steel, CMU, timber, etc.) shall be the minimum for buildings, building-like structures, and for structural and material types not specifically covered elsewhere.</p>                                                                                                                                                             |                                       |

**4.3 Building Structure Types**

| Item | Parameter           | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Notes |
|------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Operations Building | <ul style="list-style-type: none"> <li>• Steel-framed with no internal columns</li> <li>• Provide a CMU wainscot exterior, to a height of 4 feet from top of slab</li> <li>• Concrete slab on grade shall be 4 inches, minimum</li> <li>• If a Pre-Engineered Metal Building system is used, it shall be designed for the following dead loads:                         <ul style="list-style-type: none"> <li>○ Self-weight</li> <li>○ Weight of steel framing and deck</li> <li>○ Collateral Load made up of:                                 <ul style="list-style-type: none"> <li>○ 5-PSF partition wall load</li> <li>○ mechanical, electrical, and plumbing load</li> <li>○ ceiling and ceiling support system load</li> <li>○ insulation load</li> </ul> </li> </ul> </li> </ul> |       |

|   |                                   |                                                                                                                                                                                                                                                                                                                                         |                                                                                                                               |

| 1    | Concrete Design  | Concrete structures, including tanks and buildings, shall be designed and constructed in accordance with all applicable codes. The concrete mix design shall meet the requirements of ACI 318 and ACI 350. Ground water shall be sampled and tested for salinity and sulfate levels. The concrete mix design shall be adjusted to provide appropriate sulfate resistance per ACI 318 and ACI 350.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |       |
| 2    | Structural Steel | Structural steel shall be designed, fabricated and erected according to the latest applicable CBC Chapter 22 as modified by ESP 550.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |
| 3    | Connections      | <ul style="list-style-type: none"> <li>• Structural connections shall be shop welded and field bolted. Welds shall be designed and executed in accordance to ANSI/AWS D1.1 Structural Welding Code — Steel. Welding procedures shall be qualified in accordance to ANSI/AWS DI. I Section 5. Welders, Welding Operators and Tack Welders shall be currently qualified in accordance to ANSI/AWS D1.1 Section 5. Welders' certifications should be made available to City. Welding inspectors shall have current certification as an AWS Certified Welding Inspector (CWI) in accordance with AWS QCI Standard and Guide for Qualification and Certification of Welding Inspectors.</li> <li>• Bolted connections for steel buildings, building-like structures and platforms that enclose or support process equipment, shall be designed as snug-tightened connections with the threads included in the shear plane. The actual bolts provided for the connection shall have the threads excluded from the shear plane. Bolted connections shall conform to AISC Specifications for Structural Joints Using ASTM A325 or A490 Bolts.</li> </ul> |       |
| 4    | Metal Roof Deck  | Design and fabrication of metal roof deck shall be in accordance with the latest specifications of the Steel Deck Institute. Steel used in the fabrication of deck units shall conform to the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |       |

|   |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |

|   |                      | requirements of the AISI Light Gage Cold-Formed Steel Design Manual.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| 5 | Miscellaneous Metals | <ul style="list-style-type: none"> <li>• Miscellaneous metals shall include such items as gratings, metal floor plates, railings and toe plates, loose lintels and miscellaneous framing and ladders. Materials of construction shall be selected to provide maximum service life for the expected environmental conditions, including exposure to corrosive atmospheres and marine conditions. Any metal item that is submerged shall be 316 stainless steel unless the corrosivity of the environment requires different. Any metal item located in a corrosive atmosphere shall be 316 stainless steel, unless noted otherwise or if aluminum or another material is suitable and complies with the reference standards. No dissimilar metal items what would result in corrosion if in contact shall be used.</li> <li>• Aluminum shall be insulated from direct contact with concrete.</li> <li>• Miscellaneous metal shall be fabricated in accordance with the most recent applicable CBC, OSHA, or ASTM standards. All metal fabrications exposed in the finished construction, both interior and exterior, whether painted or not, shall be hot-dip galvanized (heavy duty type coating) except in aluminum only for railings, toe plates and stairways. Galvanizing of miscellaneous metal after fabrication shall be in conformance with ASTM A123 and A153.</li> <li>• Cadmium plating of miscellaneous metals shall be in accordance with ASTM A165, Type TS.</li> <li>• All anchor bolts shall be stainless steel Type 316.</li> <li>• Cages, ladders, and fall protection devices shall conform to applicable OSHA regulations.</li> </ul> |  |
| 6 | Aggregate            | Structural concrete materials shall have certification of compliance for meeting ASTM specifications and test reports certifying that no material contains asbestos and that all aggregates are non-reactive to alkalinity. All certifications, submittals, and reports shall be current within three months of use and shall be                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |

|   |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |

The DB is responsible for obtaining additional survey and utility information.            |                                                                                                         |

**5.3 Site Layout**

| Item | Parameter                    | Criteria                                                                                                                                                                                                                                                                                                              | Notes                                                                                                                                                                                                                                                     |
|------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Building/Facility Locations  | Proximity of buildings to Highway 1, nearest to furthest: <ul style="list-style-type: none"> <li>• Operations Building</li> <li>• Storm Drainage Facilities</li> <li>• Equipment/Vehicle Storage</li> <li>• Material Laydown Areas</li> <li>• Maintenance Building</li> <li>• Treatment/Process Facilities</li> </ul> | <ul style="list-style-type: none"> <li>• Reduce the visibility of the storage and process areas from the Highway.</li> <li>• Locate headworks, EQ basins, and other processes subject to odor as far from the Operations Building as feasible.</li> </ul> |
| 2    | Future 800 kW solar Facility | The site planning must include space for a future 800 kW solar facility                                                                                                                                                                                                                                               | Provisions for a future solar facility are to be included in the site layout to facilitate future constructability and access                                                                                                                             |
| 3    | Site Vehicle Circulation     | <p>The WRF facility shall be designed to allow truck and service vehicle traffic to flow smoothly without creating areas of congestion and dead-ends</p> <p>The WRF facility shall be designed such that chemical delivery and biosolids hauling trucks are not required to backup.</p>                               |                                                                                                                                                                                                                                                           |
| 4    | Fire Equipment Access        | The WRF facility must be designed to allow full access for emergency responder vehicles and equipment. Emergency responder vehicles shall be able to drive continuously throughout the site without any reverse movements.                                                                                            |                                                                                                                                                                                                                                                           |

**5.4 Site Access Road**

| Item | Parameter                 | Criteria                                                                                                                                                                                         | Notes |
|------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Site Access Road Design   | Access road shall provide vehicular access to the WRF site from the Highway 1 on and off ramps. Design of the access road shall match the geometrics and pavement section defined in Figure 5-1. |       |
| 2    | Site Access Road Location | The access road shall be generally located per Figure 5-1                                                                                                                                        |       |

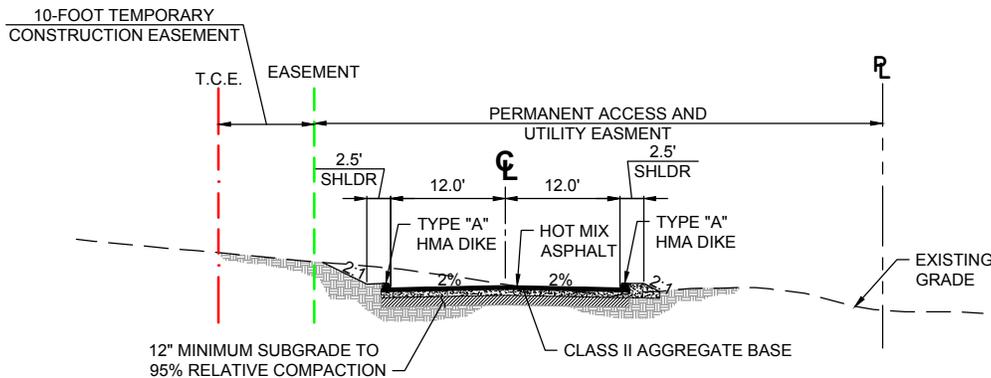

|          |                            |                                                                                                                                                                                                                                                                 |  |
|----------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>3</b> | Geotechnical Investigation | Geotechnical information for past projects located near the access road has been provided for informational purposes and can be found in Appendix N. The DB is responsible for performing additional geotechnical investigations if determined to be necessary. |  |
|----------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|

**ACCESS ROAD SITE PLAN**

Scale: 1:100

**TYPICAL ROAD SECTION**

Scale: 1:20

**GENERAL NOTES**

- ① EXTEND EDGE OF ROAD AND ADJUST CENTERLINE AS SHOWN. SUBGRADE, BASE AND ASPHALT TO MATCH THICKNESS AND MATERIAL SPECIFICATION FOR ACCESS ROAD.
- ② DB WILL BE RESPONSIBLE FOR PROTECTING EXISTING INFRASTRUCTURE. ASSUME 4,890 SF OF ROAD REPAIR WILL BE REQUIRED TO REPAIR EXISTING ROADWAY IMPACTED DURING CONSTRUCTION. SUBGRADE, BASE AND ASPHALT TO MATCH THICKNESS AND MATERIAL SPECIFICATION FOR ACCESS ROAD.

|------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Connection point | <ul style="list-style-type: none"> <li>Connect to the influent force main, recycled water pipeline, dedicated City fiber optic line, and effluent pipe, at approximately 20 feet north of the access and utility easement boundary at Highway 1 ROW</li> <li>The exact location and connection details within the access and utility easement to the WRF site shall be determined as part of the access road improvements and provided to the City by the 30% (Schematic) design submittal</li> <li>DB to connect to City potable water main offsite and extend throughout WRF property</li> <li>Refer to Utility Coordination Plan (Figure 5-2)</li> </ul> |       |
| 2    | Stubs            | Any temporary or permanent stubs should be capped, blind-flanged, or protected in a manner to prevent foreign materials from entering the pipeline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |       |

**5.6 Potable Water**

Provide on-site water distribution facilities for domestic water services at the WRF. Provide connection(s) to City water supply as shown on Figure 5-1. City will provide water meter and DB will install service and connect to City water main. System shall be completely separated and isolated from the fire water and process water systems.

| Item | Parameter          | Criteria                                                                                                                                                                                                                                                                                                                                 | Notes                            |

|   |             | while meeting the minimum and maximum pressure requirements                                                                                              |  |
| 9 | Water Meter | <ul style="list-style-type: none"> <li>Potable water service connection shall be metered and independent of the fire water service connection</li> </ul> |  |

**5.7 Fire Protection**

Provide on-site water distribution facilities for fire water services at the WRF. Fire water system shall include storage, booster pumps, distribution piping, fire sprinklers, and fire department connections, capable of meeting the requirements of Cal Fire and the City Morro Bay Fire Protection requirements for isolated structures that are not served by a water utility. Fire water system shall be separate and isolated from the potable water system.

| Item | Parameter                | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Notes |

| 9  | Water Meter                              | Fire water service connection shall be metered and independent of the potable water service connection                                                                                                                                                                                                                                                 |  |
| 10 | Fire Protection for Electrical Equipment | See Section 3.6 for fire protection criteria for electrical, computer, and communication areas                                                                                                                                                                                                                                                         |  |

**5.8 Grading and Drainage**

Provide grading improvements and a stormwater collection system consisting of gutters, swales, storm drain piping, and catch basins that collect stormwater runoff from the improved WRF Site and discharge into a detention basin. For the control of stormwater discharge from the project site the DB shall meet the requirements of the State Water Resources Control Board’s Water Quality Order 97-03-DWQ, NPDES General Permit No. CAS000001 Waste Discharge Requirements for Discharges of Stormwater Associated with Industrial Activities Excluding Construction activities.

**5.9 Pavement/Roadways**

Provide asphalt roadways and concrete pavement to provide vehicular access and circulation throughout the WRF Project site.

| Item | Parameter | Criteria                                                                                                                                                                                                                                                       | Notes |

| 10 | Curb and Gutter   | Portland cement concrete curb and gutter meeting City of Morro Bay standards shall be provided on established roadways and parking areas                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                              |

**5.10 Construction Dust Control and SWPPP Stormwater Management**

**5.10.1 Dust Control**

Prepare, obtain approval and implement all the requirements of the latest Fugitive Dust Control Plan (FDCP) in accordance with the San Luis Obispo County Air Pollution Control District Regulations. Also, the DB shall prepare, obtain approval, and implement all of the requirements of the latest State National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities Order No. 2009-0009-DWQ and industry standards according to the State Water Quality Control Board (SWQCB).

**5.10.2 Stormwater Management During Construction**

Comply with all of the requirements of the latest NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities Order No. 2009-0009-DWQ according to SWQCB and standard industry practice. This includes, but is not limited to, preparing plans and application, maps as well as all necessary reporting on the SWQCB's Stormwater Multiple Application and Report Tracking System (SMARTS System).

|--|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|

**Notice of violation and/or fines for any non-compliance will be the responsibility of the DB.**

**5.11 Facility Stormwater Management Post-Construction Requirements**

Stormwater management for the WRF shall meet the requirements of the City of Morro Bay Stormwater Management Guidance Manual for Low Impact Development & Post-Construction Requirements, Main Manual (Dated March 6, 2014 and updated July 1, 2017).

**5.12 Noise Control**

Incorporate noise reduction measures into the project design and construction. Retain an acoustical engineer to measure or calculate post-project operational noise levels at the nearest sensitive receptor based upon the final project design as implemented. If the project results in noise levels exceeding the City of Morro Bay or San Luis Obispo County Noise Ordinance thresholds, the DB shall develop additional sound-attenuation measures which may include additional enclosures for noise generating equipment to ensure that noise levels at nearby sensitive receptors are reduced to the acceptable noise levels as identified in the County thresholds for noise generators.

| Item | Parameter                          | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                        | Notes |
|------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | General Requirements               | <ul style="list-style-type: none"> <li>Sound pressure level guidelines are provided by the Code of Federal Regulations Title 29, Part 1910.95 (29 CFR 1910.95) and enforced by OSHA.</li> <li>These guidelines provide acceptable sound pressure levels for different frequencies and durations. Comply with City of Morro Bay Noise Ordinance regulations regarding community impacts and San Luis Obispo County Noise regulations.</li> </ul> |       |
| 2    | Construction Methods and Equipment | <ul style="list-style-type: none"> <li>Utilize construction methods or equipment that will meet local ordinances for the maximum decibel rating at the property line</li> <li>All construction vehicles and fixed or mobile equipment shall be equipped with properly operating and maintained mufflers</li> <li>Schedule construction such that the minimum number equipment would be operating at the same time</li> </ul>                    |       |

| 3 | Portable Noise Barriers                  | If equipment used can cause hearing damage, portable noise barriers shall be installed to reduce noise levels below hearing damage thresholds                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                             |
| 4 | Hearing Protection to Construction Staff | Provide all employees that will be exposed to noise levels greater than 75 dB over an extended period with adequate hearing protection devices to mitigate hearing damage                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                             |
| 5 | Staging Areas                            | Locate vehicle staging areas and stockpiling as far as is practicable from the existing buildings along Teresa Road                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                             |
| 6 | Noise Control Design                     | <ul style="list-style-type: none"> <li>• Noise control shall be accomplished by a combination of isolating mechanical, equipment in mechanical rooms, properly selecting equipment to meet noise criteria requirements for all equipment and components</li> <li>• Blower and compressor equipment associated with the MBR system shall be located within a dedicated mechanical room in the process building to mitigate noise levels</li> <li>• The RO feed pumps, may require individual noise enclosures to control noise levels in consideration for operators who may be working on the RO system</li> </ul> |                                                                                                                                                                                             |
| 7 | Sound Attenuation                        | Exterior mechanical equipment such as air cooled condensing units shall be provided with sound attenuating features (i.e. compressor blankets). The sound power levels from mechanical equipment shall meet minimum requirements.                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                             |
| 8 | Construction Hours                       | Construction shall be limited to between the hours of 07:00 AM and 04:00 PM to reduce construction generated noise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Exceptions may be requested in writing from the City for work requiring special accommodations. See Appendix M for limitations to mitigate noise impacts for hours outside of those listed. |

**SECTION 6 GEOTECHNICAL CRITERIA**

A Preliminary Geotechnical Baseline Report was performed for the Project site to identify geotechnical and geologic conditions and establish design performance criteria for the new plant. See Appendix J. The DB is responsible for performing additional geotechnical investigations if determined to be necessary.

**SECTION 7 MECHANICAL PIPING CRITERIA****7.1 General**

| Item | Parameter                    | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                           | Notes                                                                                                                                                                                                                                                                                                                                       |
|------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Equipment Design Approach    | <ul style="list-style-type: none"> <li>Maximize consistency and optimize spare part requirements for mechanical equipment such as valves, actuators, flowmeter and other equipment across packaged treatment systems</li> <li>Maximize access to mechanical equipment for O&amp;M purposes</li> <li>Provide necessary isolation valves to facilitate hydro testing; taking into account different pipe pressure classes</li> </ul> |                                                                                                                                                                                                                                                                                                                                             |
| 2    | Special Tools                | Provide special tools required for equipment repair                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                             |
| 3    | Equipment Pads               | Provide housekeeping/plinth pads for all equipment                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                             |
| 4    | Pipe Mounting in Trenches    | Mount pipes in pipe trenches in trench walls, to the extent possible                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                             |
| 5    | Pipe Labeling/Flow Direction | Provide painted pipe labeling, and painted flow direction arrows for proper operation for all pipework                                                                                                                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>Labels for piping 2 inches and larger shall bear the full piping system name as shown in the Piping Schedule. Provide separate flow directional arrows next to each label. Color, size, and labeling shall conform to ANSI A13.1 and Z535.1.</li> <li>Labels for piping shall be painted.</li> </ul> |
| 6    | Joint Restraint              | Provide restrained fittings for all pressure piping                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                             |
| 7    | Spare Sample Taps            | Include convenient spare sample taps throughout treatment process trains                                                                                                                                                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>Sample taps shall be accessible and properly labeled</li> <li>Locate sample taps in common areas with drains</li> </ul>                                                                                                                                                                              |
| 8    | Valve Arrangements           | Provide isolation valves and bypass piping for critical mechanical                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                             |

|   |                                |                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Item | Parameter                                    | Criteria                                                                                                                                                                                                                                                                        | Notes                                                                                                                                         |
|------|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Bolts and Nuts for Flanges                   | Bolts and nuts for buried or submerged Class 125 or 150 flanges and Class 125 or 150 flanges located indoors, outdoors above ground or in vaults and structures shall be Type 316 stainless steel conforming to ASTM A193, Grade B8M for bolts and ASTM A194, Grade 8M for nuts | Bolts used in flange insulation kits shall conform to ASTM A193 (Grade B7). Nuts shall conform to ASTM A194 (Grade 2H).                       |
| 2    | Lubricant for Stainless Steel Bolts and Nuts | Prior to assembly, coat threaded portions of stainless steel bolts and nuts with lubricant                                                                                                                                                                                      | Lubricant shall be chloride free and shall be RAMCO TG-50, Anti-Seize by RAMCO, Specialty Lubricants Corporation Husky™ Lube O'Seal, or equal |

**SECTION 8 ELECTRICAL SYSTEM CRITERIA**

**8.1 Utility Electrical Service**

The City is coordinating the effort to obtain the electrical service from Pacific Gas & Electric (PG&E). Service voltage shall be obtained at 480Y/277V, three-phase four-wire. Install the on-site infrastructure for the primary service to a utility pad-mounted transformer and for the transformer secondary lateral to the service switchboard as identified on the drawings prepared by PG&E.

**8.2 Data Service**

The City is coordinating the effort to obtain the data service from the local utility. Install the on-site infrastructure.

**8.3 Alternative Solar Power**

Provide sufficient floor area, headroom space, and clearances adjacent to the main service switchboard for installation of a future photovoltaic inverter, minimum 800kW, and future net energy metering switchboard for connection to the PG&E grid. Conduits of adequate sizes shall be installed between the inverter and grade mounted handholes outside of the main electrical building, in quantities and locations as required for connection to the future photovoltaic strings. All monitor points and alarms for the proposed photovoltaic system shall be transmitted to the SCADA system.

**8.4 Electrical Distribution**

Provide a radial distribution network for both of the normal and emergency 480Y/277V, three-phase, four wire systems and the 208Y/120V, three-phase, four-wire systems. The main electrical building will house the main service switchboard and transfer switch, a motor control center for the dewatering area and chemical storage, and a transformer for serving the panel that will provide the 120V branch-circuits at and near the equipment. The generator shall be located in an exterior enclosure. Radial feeds from the service board distribution section shall be provided to motor control centers. The motor control centers and distribution switchboards shall include the feeders for distribution transformers and 208Y/120V, three-phase, four-wire panelboards in each electrical room.

**8.5 Basic Electrical Work**

**8.5.1 Raceways**

| Item | Parameter | Criteria                                                                                                                                            | Notes |
|------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Exposed   | PVC coated rigid steel conduit shall be used for all exposed locations around process areas, in vaults and structures, and in corrosive locations   |       |
| 2    | Concealed | Concealed conduits shall be rigid galvanized steel except in the Operations and Maintenance Buildings, where electrical metallic tubing may be used |       |

|   |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |
|---|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| 3 | Underground       | <ul style="list-style-type: none"> <li>Bury underground conduits containing maximum 600-volt conductor insulation a minimum depth of 24" from surface of finished grade to the top surface of the conduit. Where they run under roadways or parking areas, depth shall be 30" minimum from finished grade.</li> <li>Conduits shall be PVC coated rigid steel conduit. Schedule 40 PVC conduits shall be permissible where encased in a minimum two inch concrete envelope.</li> </ul> |  |
| 4 | Final Connections | Use liquid-tight non-metallic flexible conduit for final connection to equipment                                                                                                                                                                                                                                                                                                                                                                                                      |  |

**8.5.2 Conductors**

| Item | Parameter                                             | Criteria                                                                                                                            | Notes |
|------|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Indoor Feeders and Indoor and Outdoor Branch-Circuits | Use 600V copper conductors with THWN/THHN insulation                                                                                |       |
| 2    | Outdoor Feeders and Load Side of VFDs                 | Use 600V copper conductors with XHHW insulation                                                                                     |       |
| 3    | Terminations                                          | Branch-circuit terminations in wet locations shall be listed for the applications. Provide insulated tap blocks for feeder splices. |       |

**8.5.3 Wiring Devices**

Provide power to receptacles from 208Y/120V panel boards. Feed adjacent receptacles from alternate panelboard circuits. Locate separately powered receptacles adjacent to HVAC and other specialized equipment. In interior and exterior process areas locate receptacles every 50 feet, and every 12 feet of wall space in occupied areas. Ground fault circuit interrupting (GFCI) type receptacles shall be located in lavatories, outdoors, wash-down process areas, below-grade structures, rooftops and tunnels.

**8.5.4 Grounding**

Provide a maximum 2 ohm resistance earth to ground and conform to IEEE Standard 142. Structures shall have perimeter ground grid with rods in test wells. Interconnect individual structure grounding systems. Building steel, process equipment, electrical equipment and enclosures, and exposed metal which might become a current conductor shall be connected to the ground grid. Exposed ground connections shall be compression lug type. Concealed, buried, or embedded ground connections shall be made by the exothermic method, except for the connection to the ground rod which shall be compression lug type. All conduits shall contain an equipment grounding conductor.

**8.5.5 Boxes**

| Item | Parameter                          | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Notes                                                                      |
|------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| 1    | Underground Manholes and Handholes | <ul style="list-style-type: none"> <li>• Provide concrete handholes with sufficient depth to accommodate the branch-circuits and/or feeders. Provide with steel lid in traffic areas and concrete lids in parkways and planters.</li> <li>• Provide concrete manholes with a minimum size of 4'6" x 8' x 8'd, permanent galvanized ladder, and pulling rings.</li> <li>• Provide fiberglass racks in each handhole with a footprint equal to or larger than 2'6" x 3'0" and in all manholes.</li> </ul> | Provide H2O bridge loading in all areas with incidental or regular traffic |
| 2    | Cast-Iron Outlet Boxes             | Install cast-iron outlet boxes in surface mounted applications. Provide explosion-proof boxes and fittings as required by the hazard classifications.                                                                                                                                                                                                                                                                                                                                                   |                                                                            |
| 3    | Sheet-Metal Outlet Boxes           | Provide sheet-metal outlet boxes at dry non-hazardous locations in the Operations and Maintenance buildings                                                                                                                                                                                                                                                                                                                                                                                             |                                                                            |
| 4    | Pull Boxes                         | Provide IP 68 NEMA 4X boxes in all locations. Pull boxes subject to damage shall be stainless steel. Pull boxes in hazardous locations shall be listed explosion-proof.                                                                                                                                                                                                                                                                                                                                 | Locate pull boxes above grade to the extent possible                       |

**8.5.6 Identification**

| Item | Parameter                      | Criteria                                                                                                                                                                                                                            | Notes |
|------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Conduit Identification         | Where electrical conduit is exposed in spaces with exposed mechanical piping that is identified by a color-coded method, provide color-coded identification on electrical conduit in a manner similar to piping identification      |       |
| 2    | Cable/Conductor Identification | Provide method for cable/conductor identification including voltage, phase, and feeder number on each cable and conductor in each box/enclosure/cabinet where wires of more than one lighting or power circuit occur or where alarm |       |

|   |                    |                                                                                                                                                             |  |
|---|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|   |                    | conductors of communication, signal, or alarm systems are present, except where another form of identification (such as color-coded conductors) is provided |  |
| 3 | Equipment Labeling | Submit comprehensive labeling schedule indicating tag information, type, material of construction, manufacturer, and other critical information             |  |

**8.5.7 Supports and Anchors**

Provide seismic anchorage for all floor, wall, and rack mounted electrical equipment. Base-specific seismic criteria shall use values determined in accordance with ASCE 7-102 as amended by the 2016 CBC, Chapter 16. Arrange for grouping of parallel runs of horizontal conduits to be supported together on seismically braced trapeze type hangers where possible.

**8.6 Distribution Equipment**

**8.6.1 General**

Certify distribution equipment for base-specific seismic criteria using values determined in accordance with ASCE 7-102 as amended by the 2016 CBC, Chapter 16. Provide withstand ratings greater than the maximum short-circuit current available at the line terminals of the equipment. Series rated systems shall not be used.

**8.6.2 Switchboards**

| Item | Parameter               | Criteria                                                                                                                                                                                                                   | Notes |
|------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Service Switchboard     | Provide 480Y/277V, three-phase, four-wire switchboard with adequate capacity to carry the calculated load. Include pull section, distribution section, and automatic transfer section bussed together for a complete unit. |       |
| 2    | Circuit Breakers        | Provide main circuit breaker and distribution circuit breakers rated for the calculated load. Provide insulated case power circuit breakers with zone selective interlocking for system selectivity.                       |       |
| 3    | Ground-Fault Protection | Provide ground-fault protection for the main circuit breaker and distribution circuit breakers immediately downstream of the main circuit breaker                                                                          |       |
| 4    | Bus Material            | Provide fully rated tin plated copper bus bars. Tapered bus shall not be used.                                                                                                                                             |       |

|   |           |                                                                                                                                                                                                                                                                                             |                                                                                     |
|---|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|   |           | Provide with full rated neutral. Provide copper ground bus.                                                                                                                                                                                                                                 |                                                                                     |
| 5 | Enclosure | <ul style="list-style-type: none"> <li>All cabinetry located outdoors should be fully enclosed, no false fronts or HMI on outside doors.</li> <li>Provide NEMA 4X enclosure for exterior locations and in process areas. Install in a dry non-hazardous location where possible.</li> </ul> | Any internal equipment requiring regular maintenance shall be out of arc flash area |

**8.6.3 Motor Control Centers**

| Item | Parameter    | Criteria                                                                                                                                                                                                                                                                                    | Notes                                                                              |
|------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| 1    | General      | Provide grouped motor controls in a motor control center including supporting structures, bus systems, starter units, controllers, disconnects, overload protection, and motor control accessories                                                                                          |                                                                                    |
| 2    | Standards    | The control centers shall be NEMA Class II, Type B, plug-in, designed, manufactured, and tested to meet the latest IEEE and NEMA standard                                                                                                                                                   |                                                                                    |
| 3    | Controls     | <ul style="list-style-type: none"> <li>Selector switches and pilot lights shall be heavy-duty, oil-tight, and have the number of positions and poles indicated</li> <li>Control relays shall be machine tool type with 115-volt AC coils</li> </ul>                                         |                                                                                    |
| 4    | Starters     | Except where VFDs are provided, magnetic starters shall be combination motor circuit protector type, full voltage, single speed or two speed, reversing or non-reversing                                                                                                                    |                                                                                    |
| 5    | Bus Material | Provide fully rated tin plated copper bus bars. Provide with full rated neutral. Provide copper ground bus.                                                                                                                                                                                 |                                                                                    |
| 6    | Enclosure    | <ul style="list-style-type: none"> <li>All cabinetry located outdoors should be fully enclosed, no false fronts or HMI on outside doors.</li> <li>Provide NEMA 4X enclosure for exterior locations and in process areas. Install in a dry non-hazardous location where possible.</li> </ul> | Any internal equipment requiring regular maintenance must be out of arc flash area |

**8.6.4 Distribution Transformers**

Provide dry-type distribution transformers with aluminum windings and enclosures suitable for the installed environment. Transformers shall have 480V primary and 208Y/120V three-phase, four-wire secondary.

**8.6.5 Panelboards**

| Item | Parameter        | Criteria                                                                                                                                                                                                                                                                                    | Notes                                                                               |
|------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| 1    | Enclosures       | <ul style="list-style-type: none"> <li>All cabinetry located outdoors should be fully enclosed, no false fronts or HMI on outside doors.</li> <li>Provide NEMA 4X enclosure for exterior locations and in process areas. Install in a dry non-hazardous location where possible.</li> </ul> | Any internal equipment requiring regular maintenance shall be out of arc flash area |
| 2    | Circuit breakers | Provide bolt fastened thermal magnetic circuit breakers with ratings appropriate for the calculated loads. Provide 30% spare breakers in each panel.                                                                                                                                        |                                                                                     |
| 3    | Bus Material     | Provide fully rated tin plated copper bus bars. Provide with full rated neutral. Provide copper ground bus.                                                                                                                                                                                 |                                                                                     |

**8.6.6 Motors**

| Item | Parameter       | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Notes |
|------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Motor Selection | Select motors to permit the connected load to develop its specified output continuously without encroaching on the service factor under normal operating conditions. The service factor shall be 1.15 for motors 200 horsepower and less. Motors larger than 200 horsepower shall have a service factor of 1.0.                                                                                                                                                                              |       |
| 2    | Motor Design    | <ul style="list-style-type: none"> <li>Design motors for full voltage starting and frequent starting, where required. Provide motors suitable for continuous duty in the specified ambient conditions. Intermittent duty motors will be selected where recognized and defined as standard by the equipment standards and codes.</li> <li>The following design parameters shall be considered: Motor manufacturer, environment, including special enclosure requirements, voltage,</li> </ul> |       |

|   |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |
|---|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|   |                | frequency, and phases, running and starting requirements and, limitations and duty cycle, motor type (synchronous, induction, DC, etc.) and construction, power factor, service factor, speed and direction of rotation, insulation, bearing construction, rating life of rolling elements, and external lube oil system for sleeve or plate bearings, ambient noise level and noise level for motor and driven equipment, termination provisions for power, grounding, and accessories, installation, testing, and maintenance requirements, special features (shaft grounding, temperature and vibration monitoring, etc.), and motor space heater requirements. |  |
| 3 | Motor Starting | The torque of all induction motors will be required to accelerate inertia loads of both motor and driven equipment to full speed without damage to the motor or other equipment. Provide maximum 20 percent voltage drop from the specified motor nameplate rating for motor starting. Provide minimum NEMA size 1 starters.                                                                                                                                                                                                                                                                                                                                       |  |
| 4 | VFDs           | Motors connected to VFDs shall be inverter duty rated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |

**8.6.7 Motor Controls**

| Item | Parameter                        | Criteria                                                                                                                                                                                                                                                                                                                              | Notes |
|------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Combination Starters             | <ul style="list-style-type: none"> <li>Provide full voltage starting for all motors less than 25 HP that are not operated with a VFD. Minimum size starter shall be NEMA size 1.</li> <li>Unless motor is operated with a VFD, Solid State Reduced-Voltage (SSRV) soft starters shall be used for motors larger than 25 HP</li> </ul> |       |
| 2    | Variable Frequency Drives (VFDs) | Provide 18 pulse VFDs where specified                                                                                                                                                                                                                                                                                                 |       |
| 3    | Manual Motor Starters            | Where fractional horsepower motors are not automatically started, provide manual motor starters using toggle switch mechanism and enclosure rated for the                                                                                                                                                                             |       |

|   |                           |                                                                                                                                                                                                                                                                                             |  |
|---|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|   |                           | environment. Provide with or without overcurrent protection as required by the installation.                                                                                                                                                                                                |  |
| 4 | Enclosures                | <ul style="list-style-type: none"> <li>All cabinetry located outdoors should be fully enclosed, no false fronts or HMI on outside doors.</li> <li>Provide NEMA 4X enclosure for exterior locations and in process areas. Install in a dry non-hazardous location where possible.</li> </ul> |  |
| 5 | Pilot Lights and Switches | <ul style="list-style-type: none"> <li>Selector switches and pilot lights shall be heavy-duty, oil-tight, and have the number of positions and poles indicated</li> <li>Control relays shall be machine tool type with 115-volt AC coils</li> </ul>                                         |  |

**8.6.8 Standby Generator**

| Item | Parameter            | Criteria                                                                                                                                                                                                                                                                                                                                         | Notes |
|------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Capacity             | Provide a standby generator rated 480Y/277V, three-phase, four-wire with capacity to carry the entire treatment plant electrical load. The generator shall be connected and operated as a separately derived system.                                                                                                                             |       |
| 2    | Fuel Source          | Provide diesel powered generator. The generator shall have a double containment separate aboveground double containment fuel tank, with leak detection and sufficient fuel storage to operate the plant on backup power for a minimum of 24 hours without refueling. Provide alarm contacts for reporting to the SCADA system.                   |       |
| 3    | Main Circuit Breaker | <ul style="list-style-type: none"> <li>Provide a main circuit breaker rated to carry the calculated load. Provide insulated case power circuit breakers with zone selective interlocking for system selectivity.</li> <li>The circuit breaker shall be either wall or rack mounted at a location adjacent to the generator enclosure.</li> </ul> |       |
| 4    | Enclosure            | Provide a sound-attenuated weatherproof generator enclosure meeting 70dB(A) at fifty feet                                                                                                                                                                                                                                                        |       |

|   |                                |                                                                                                                                                                                                                                                                                        |                           |
|---|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| 5 | Accessories                    | Provide generator enclosure complete with battery charger, engine block heater, and generator condensation heater, battery, and exhaust silencer                                                                                                                                       |                           |
| 6 | Engine Oil                     | DB to provide initial fill of oil and the first oil change, including oil filters                                                                                                                                                                                                      |                           |
| 7 | Alarms                         | Provide electronic generator control panel with discrete alarm contacts for each alarm for reporting on the SCADA system. Comply with NFPA 110 for remote alarm annunciation.                                                                                                          | Coordinate with Section 9 |
| 8 | Alternative Generator Proposal | Provide an option for a natural gas-powered generator supplied by the natural gas service with a liquid propane tank system as backup fuel supply. The liquid propane tank shall provide fuel storage to operate the plan on backup power for a minimum of 24 hours without refueling. |                           |

**8.6.9 Automatic Transfer Switch**

Provide a 480V four-pole transfer switch for connecting the plant load to the standby generator upon loss of utility company power. Transfer switch shall be solenoid operated and mounted in a bussed lineup with the main service switchboard for installation in a dry non-hazardous location.

**8.7 Lighting Equipment**

| Item | Parameter                              | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Notes |
|------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Illumination Engineering Society (IES) | Comply with the IES Recommended Practice for Lighting Industrial Facilities RP-7-17.                                                                                                                                                                                                                                                                                                                                                                                                                |       |
| 2    | Interior Lighting                      | <ul style="list-style-type: none"> <li>Provide LED strip lighting with door switch inside control panels if the enclosure size is greater than or equal to 30" wide and greater than or equal to 12" deep.</li> <li>Adequate lighting, ventilation and access for maintenance or removal of equipment and screenings shall be provided. Adequate lighting throughout the wastewater treatment facility shall be provided, particularly in areas of operation and maintenance activities.</li> </ul> |       |

|   |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                           |
|---|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
|   |                   | <ul style="list-style-type: none"> <li>• Provide metallic or non-metallic luminaire housings appropriate for the classification of the area.</li> <li>• Lighting shall be included in all treatment buildings. Battery operated emergency lights shall be provided at all confined spaces. Lights shall be located in an area that is easily accessible to replace components.</li> </ul>                                                                                              |                           |
| 3 | Exterior Lighting | <ul style="list-style-type: none"> <li>• Provide full cutoff LED site lighting in each process area. Lighting standards adjacent to any open process structure flush or below grade shall be provided with hinged pole base. Provide poles with 316SS anchors and hardware.</li> <li>• Aim exterior pole and building lighting to avoid any light trespass on adjacent property lines. All pole and building luminaires shall be full cutoff and located to minimize glare.</li> </ul> | Coordinate with Section 9 |
| 4 | Lighting Controls | <ul style="list-style-type: none"> <li>• Provide switches, photocells, and receptacles at all lighting poles. Provide for automated lighting control through the SCADA system so that the facility is only illuminated to the degree necessary to maintain safe operation.</li> <li>• Provide lighting software calculations showing compliance with California Title 24 Energy Standard requirements in all areas.</li> </ul>                                                         |                           |

**8.8 Fire Alarm System**

Provide a plant-wide addressable fire detection and alarm system, with audible as well as visual alarm signals, conforming to the requirements of the local fire marshal, NFPA, and Factory Mutual requirements. System shall be connected to SCADA and, through the SCADA System, simultaneously contact the fire department and annunciate in the operations control room when any alarm is activated.

**8.9 Hazardous and Environmental Locations**

| Item | Parameter            | Criteria                                                                                                                                                                                                                                                                                           | Notes |
|------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Classified Locations | Classify areas where flammable and combustible liquids, gases, and dusts are handled and stored for determining the minimum criteria for design and installation of electrical equipment to minimize the possibility of ignition. Use the latest edition of NFPA 820 and Article 500 of the latest |       |

|   |                         |                                                                                                                                                                                                                                                                                                                                                                                                                         |  |
|---|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|   |                         | California Electrical Code for determining the appropriate classification.                                                                                                                                                                                                                                                                                                                                              |  |
| 2 | NFPA 820                | Enclosed areas with exposure to raw wastewater, wastewater sludges, and corrosive or hazardous atmospheres will require that the lighting and electrical systems be of the appropriate hazard classification as defined in NFPA 820                                                                                                                                                                                     |  |
| 3 | Electrical Code         | Install electrical equipment in areas classified as hazardous in accordance with the requirements of Articles 501 and 502 of the California Electrical Code (latest edition)                                                                                                                                                                                                                                            |  |
| 4 | Drawing Notations       | Identify classified locations in all process areas on the construction drawings                                                                                                                                                                                                                                                                                                                                         |  |
| 5 | Confined Spaces         | The design shall minimize confined spaces to the extent possible.                                                                                                                                                                                                                                                                                                                                                       |  |
| 6 | Environmental Locations | All electrical equipment shall be rated for the environment in the installed locations. Outdoor installations shall include equipment rated for wet locations. Identify all other indoor wet, damp, and dry locations on the drawings. All cabinetry installed outdoors or in damp or wet locations shall be fully enclosed, with no false fronts or HMI on outside doors. Only lights are allowed on top of cabinetry. |  |
| 7 | Equipment Maintenance   | Locate all electrically operated equipment requiring regular maintenance outside of arc-flash equipment boundaries                                                                                                                                                                                                                                                                                                      |  |

**8.10 Electrical System Studies**

| Item | Parameter                       | Criteria                                                                                                                                                                                                                                                  | Notes |
|------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Preliminary Short-Circuit Study | During the design phase, prepare a preliminary short-circuit study based on maximum available fault current provided by the utility. The results of this study will determine the minimum withstand and interrupting ratings of the electrical equipment. |       |

|   |                           |                                                                                                                                                                                                        |                                                                                     |
|---|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| 2 | Final Short-Circuit Study | Prepare a final short-circuit study using the as installed feeder lengths. The results of this study will be used to complete the Coordination Study.                                                  |                                                                                     |
| 3 | Coordination Study        | Prepare a Coordination Study showing required selective coordination between the installed overcurrent devices. The results of this study will be used to complete the Arc-Flash Study.                |                                                                                     |
| 4 | Arc-Flash Study           | Prepare an Arc-Flash Study to determine the incident energy levels, protection boundaries and personnel protective equipment                                                                           | Any internal equipment requiring regular maintenance shall be out of arc flash area |
| 5 | Computer Program          | Perform each electrical system study using software purchased from industry recognized organizations. Provide for submittal of the project specific software results for each electrical system study. |                                                                                     |

**8.11 Electrical Testing**

| Item | Parameter                 | Criteria                                                                                                                                                    | Notes |
|------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Manufacturer Requirements | Perform all field testing per manufacturer's instructions. Submit results of testing.                                                                       |       |
| 2    | ANSI/NETA                 | Provide electrical system testing as identified in Standard for Acceptance Testing Specifications ANSI/NETA ATS, Latest Edition. Submit results of testing. |       |
| 3    | NFPA 110                  | Test generator and generator alarms per the requirements of Standard for Emergency and Standby Power System NFPA-110-2016. Submit results of testing.       |       |
| 4    | NFPA 72                   | Test fire alarm system per the requirements of National Fire Alarm and Signaling Code NFPA 72 (latest edition). Submit results of testing.                  |       |

**SECTION 9 INSTRUMENTATION AND CONTROLS**

**9.1 General**

The City is in the process of developing a SCADA system Master Plan (by others) to develop a standardized platform of PLCs, Operator Interface Terminals (OITs), SCADA software, and telemetry for the Water and Wastewater Divisions. The City intends to upgrade the remote sites with the new SCADA system (by others). It is assumed that all remote sites will communicate to a central location located at the existing WWTP site. From this location, communications will be relayed to the new WRF via fiber-optic. Water and Wastewater Division SCADA facilities including software and hardware will be located at the new WRF.

The SCADA Master Plan is scheduled for completion in June 2018. The new WRF SCADA system shall meet the following performance criteria, and be based upon and fully compatible with the recommendations in the SCADA Master Plan.

**9.2 System Description**

**9.2.1 Plant Architecture and Software**

This section describes the plant architecture, from the Wide Area Network (WAN), through the Plant Local Area Network (LAN) and the PLC network to the instrumentation networking.

| Item                          | Parameter                                | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Notes                                                                                                                                                   |
|-------------------------------|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>City Wide Area Network</b> |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                         |

**9.2.2 Redundancy, Reliability, and Spares**

| Item | Parameter   | Criteria                                                                                                                                                                                                                | Notes |
|------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Requirement | The inventory of spares shall be maintained during the DB Transitional Operation period such that all spares noted in the original inventory are still available at the conclusion of the Transitional Operation period |       |

|    |                        |                                                                                                                                                                                                                                                                                                                   |                                      |
|----|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| 2  | PLC                    | Online redundant PLCs may be required for critical processes                                                                                                                                                                                                                                                      |                                      |
| 3  | PLC Uninstalled Spares | <ul style="list-style-type: none"> <li>• Provide spares sufficient to allow any of the following to be swapped out on failure:                             <ul style="list-style-type: none"> <li>○ PLC IO cards (hot-swapped)</li> <li>○ backplane</li> <li>○ CPU</li> <li>○ Power supply</li> </ul> </li> </ul> |                                      |
| 4  | I/O Cards              | Duty/standby unit I/O and equipment from separate process trains shall be connected to separate I/O cards                                                                                                                                                                                                         |                                      |
| 5  | I/O Capacity           | Installed spare IO capacity of 25% in all PLCs, excluding vendor-supplied PLCs associated with specific equipment                                                                                                                                                                                                 |                                      |
| 6  | Program Backup         | <ul style="list-style-type: none"> <li>• Programs and configuration backups shall be stored for fast upload into new modules or CPUs if they are replaced</li> <li>• During Transitional Operation period backup copies of the PLC programs will be made every 2 months, minimum</li> </ul>                       |                                      |
| 7  | Server Redundancy      | Provide redundant servers for HMI Application Servers, Device Integration Servers and Historian                                                                                                                                                                                                                   | Provide hot standby for SCADA server |
| 8  | Power Supply           | PLC Hardware Racks shall have adequate power supplies installed to support a minimum of 25 percent I/O expansion                                                                                                                                                                                                  |                                      |
| 9  | Reliability            | The network system shall be designed to be robust and reliable and shall meet latest Department of Homeland Security (DHS) Best Management Practices (BMPs)                                                                                                                                                       | Coordinate with SCADA Master Plan    |
| 10 | Battery Backup & UPS   | All control CPU's, PLC's and additional hardware necessary to keep the WRF functioning or automatically restart after a power loss shall be powered through UPS power circuit(s). This requirement includes the main operation control room computers and monitors.                                               |                                      |

**9.3 Cyber Security**

| Item | Parameter | Criteria | Notes |

| 25 | Exterior Lighting          | All exterior lighting shall be SCADA controllable (on-off times)                                                                                                                                                                                                                                                                                                                                                                                                    |                                                             |

**9.4.3 Junction Boxes**

| Item | Parameter  | Criteria                                              | Notes |
|------|------------|-------------------------------------------------------|-------|
| 1    | Mounting   | Shall be accessible from floor or platforms           |       |
| 2    | Doors      | Doors shall be able to open without interference      |       |
| 3    | Pull Boxes | Provide above-grade pull boxes to the extent feasible |       |

**9.4.4 Local Control Panels**

| Item | Parameter                                                                     | Criteria                                                                                                                                                                                                                                                                                                                                                                     | Notes |
|------|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Location                                                                      | <ul style="list-style-type: none"> <li>• Located close to the equipment</li> <li>• Local control switches and indicators only where required to address specific safety or maintenance concerns, otherwise all manual control shall be available via SCADA only (accessible locally via wireless tablet or operator node computers)</li> </ul>                               |       |
| 2    | Local-Off-Remote Switch and Control Devices, Indicator Lights and Pushbuttons | <ul style="list-style-type: none"> <li>• Where required, LOR switch shall allow an operator to take manual control of a device or piece of equipment and operate it from that panel manually.</li> <li>• LCPs should be protected from the weather and/or be appropriate for the environment that they are operated in. All exterior enclosures shall be NEMA 4X.</li> </ul> |       |
| 3    | Enclosures                                                                    | <ul style="list-style-type: none"> <li>• All cabinetry located outdoors should be fully enclosed, no false fronts or HMI on outside doors.</li> <li>• Any internal equipment requiring regular maintenance shall be out of arc flash area.</li> </ul>                                                                                                                        |       |

**9.4.5 Instrument Mounting and Access**

| Item | Parameter                   | Criteria                                                                                                                                                                                                                          | Notes |
|------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Housing                     | All outdoor process instruments shall be housed in IP68, NEMA 4X enclosures, or vendor requirements, whichever is more stringent                                                                                                  |       |
| 2    | Access                      | Access shall be considered in the selection of instrumentation. For example, tanks shall be measured using pressure at the base of the tank wherever practical, to eliminate the need for maintenance access to the top of tanks. |       |
| 3    | Instrument Height           | Instruments mounted at a working level between 3 and 5 feet above the operating floor                                                                                                                                             |       |
| 4    | Indicator Height            | Process indicators and indicating transmitters mounted in a position that is readable by an operator without requiring the use of a ladder or the building of platforms                                                           |       |
| 5    | Capillary Tube Installation | Temperature and pressure instruments capillary sensors shall be installed and clamped in tube racks. Excess capillary tube shall be                                                                                               |       |

|   |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
|---|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|   |                       | coiled and clamped to the mounting stand below the instrument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |
| 6 | Grouping              | Instruments located near each other shall be grouped to the maximum extent possible on a common mounting stand, wall bracket or instrument rack                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| 7 | Dirt/Moisture Removal | Instrument impulse lines shall incorporate a blowdown leg or contamination accumulation leg for the removal of dirt and moisture                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
| 8 | Isolation Valves      | <ul style="list-style-type: none"> <li>• Instrumentation taps to process lines shall be isolated by a root valve at the connection</li> <li>• Isolation valves for taps to process lines shall be 1/4-turn ball valves of materials compatible with the process fluid</li> <li>• Isolation valves for chemical service shall match isolation valves used in other portions of that chemical piping</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |
| 9 | Analyzers             | <ul style="list-style-type: none"> <li>• Analyzers for primary process lines shall be installed in bypass assemblies external to the main process headers to allow routine maintenance</li> <li>• Analyzer assemblies shall include an isolation valve at each process connection tap, pressure regulator, manual sample valve, rotameter flow element with integral flow metering valve, check valve, miscellaneous piping and fittings</li> <li>• Generally, panel mounted and located in close proximity to the relevant sample point in a designated analyzer room (where possible) for improved access for common operational and maintenance activities on these units</li> <li>• The analyzer waste streams shall be discharged into a tundish and drained to a common collection point for either pumped return to a specified point along the process or drained to waste</li> <li>• All analyzers shall have zero flow detection and pressure and flow control valves on the inlet to ensure a constant rate of feed through the analyzer</li> <li>• Manual sample points shall be provided for sampling water at various points through the main process, typically with each change in process unit and upstream and</li> </ul> |  |

| Item | Parameter          | Criteria                                                                                                                                        | Notes |
|------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Equipment Labeling | Submit comprehensive labeling schedule indicating tag information, type, material of construction, manufacturer, and other critical information |       |

**SECTION 10 MECHANICAL HVAC CRITERIA**

**10.1 General**

The following section includes the performance criteria for the mechanical HVAC systems for the WRF. Coordinate these requirements with Section 9.

**10.1.1 Code Requirements**

All work shall conform to the requirements of the latest edition of the following codes:

| Item | Parameter   | Criteria                         | Notes |
|------|-------------|----------------------------------|-------|
| 1    | Building    | California Building Code (CBC)   |       |
| 2    | Mechanical  | California Mechanical Code (CMC) |       |
| 3    | Energy      | California Energy Code (CEnC)    |       |
| 4    | Fire        | California Fire Code (CFC)       |       |
| 5    | Ventilation | NFPA 820                         |       |

**10.1.2 Referenced Standards**

All work shall comply with the latest edition of the referenced standards from the following organizations:

| Item | Parameter     | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Notes |

| 1    | Buildings Containing WRF Processes or Equipment        | Supply air and exhaust air ventilation in accordance with NFPA 820, latest edition                                                                                                                                                                                                                                                              |       |
| 2    | Operations Building and Maintenance Building           | <ul style="list-style-type: none"> <li>Outdoor air ventilation in accordance with the 2016 CEnC and ASHRAE 62</li> <li>Exhaust air ventilation in accordance with 2016 CMC and ASHRAE 62, minimum 10 air changes per hour</li> <li>Provide a minimum of 6 air changes per hour for tanks, channels, and/or within process enclosures</li> </ul> |       |
| 3    | Electrical Building, Electrical Rooms, and Server Room | Outdoor air ventilation sufficient to maintain the spaces at a positive differential pressure of 0.1 inches water column relative to ambient                                                                                                                                                                                                    |       |

**10.1.6 Configuration of Systems**

| Item | Parameter                                                                | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                    | Notes                 |
|------|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| 1    | Buildings Containing WRF Processes or Equipment                          | HVAC systems serving buildings containing WRF processes or equipment shall provide sufficient ventilation to achieve the lowest electrical hazardous location classification indicated in NFPA 820. Centrifugal fans and air cleaning devices should be used for ventilation. Multiple fans shall be employed with one supply fan and one exhaust fan on standby to become operations if a supply fan or exhaust fan fails. |                       |
| 2    | Operations Building and Maintenance Building: Non-Shop and Storage Areas | Rooftop package air conditioning (AC) units, power ventilators, and air cleaning devices should be used for HVAC systems                                                                                                                                                                                                                                                                                                    | Minimum four AC units |
| 3    | Maintenance Building Shop and Storage Area: 60 degrees F minimum         | Power ventilators and air cleaning devices should be used                                                                                                                                                                                                                                                                                                                                                                   |                       |
| 4    | Electrical Building and Electrical Rooms                                 | Split system air conditioner, (100% redundant), power ventilators, and air                                                                                                                                                                                                                                                                                                                                                  |                       |

|   |             |                                                                                                                           |  |
|---|-------------|---------------------------------------------------------------------------------------------------------------------------|--|
|   |             | cleaning devices should be used for HVAC systems                                                                          |  |
| 5 | Server Room | Split system air conditioner, (100% redundant), power ventilator, and air cleaning devices should be used for HVAC system |  |

**10.2 Basic Mechanical HVAC Work**

| Item | Parameter            | Criteria                                                                                                                                                                                                                                                                                   | Notes |
|------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Listing              | All equipment, devices, and control panels furnished as part of this work shall be listed, labeled, or certified for the intended use by a Nationally Recognized Testing Laboratory as recognized by the United States Department of Labor, Occupational Safety, and Health Administration |       |
| 2    | Motors               | All motors shall conform to NEMA Standards MG 1                                                                                                                                                                                                                                            |       |
| 3    | Supports and Anchors | Pipe supports and anchors shall conform to the requirements of MSS SP-58, SP-69, and SP-89                                                                                                                                                                                                 |       |
| 4    | Identification       | All piping, valves, ductwork, and equipment shall be label in accordance with ANSI A13.1                                                                                                                                                                                                   |       |
| 5    | Insulation           | Insulate refrigerant piping, condensate drain piping within buildings, and supply and return ductwork                                                                                                                                                                                      |       |
| 6    | Access               | Provide permanent access via ladders or stairs for all equipment                                                                                                                                                                                                                           |       |

**10.3 Fuel Storage for Emergency Generator**

| Item | Parameter    | Criteria                                                                                                                    | Notes |
|------|--------------|-----------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Storage Tank | Provide propane backup tank and dual fuel generator with sufficient volume to provide full plant power for minimum 12 hours |       |

**10.4 Mechanical HVAC Equipment**

| Item | Parameter                              | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Notes |
|------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Rooftop Package Air Conditioning Units | <p>Unit shall be outdoor type, rooftop mounted, electrically controlled, cooling unit utilizing a hermetic scroll compressor and gas heating. Unit shall use R-410A refrigerant. Unit shall meet ASHRAE 90.1 minimum efficiency requirements, be rated in accordance with AHRI Standards 210/240 and 340/360, be designed to conform to ASHRAE 15, 2001, and be UL-tested and certified in accordance with ANSI Z21.47 Standards and UL-listed. Roof curb shall be designed to conform to NRCA Standards. Unit shall be designed in accordance with UL Standard 1995, including tested to withstand rain. High efficient motors shall meet section 313 of the Energy Independence and Security Act of 2007 (EISA 2007). Interior cabinet surfaces of evaporator compartment shall be insulated with a minimum 1/2 inch thick, minimum 1-1/2 lb. density, flexible fiberglass insulation. Controls shall be complete with self-contained low-voltage control circuit protected by a resettable circuit breaker on the 24V transformer side. Safeties shall include compressor over-temperature and over-current and low-pressure switch, and high-pressure switch. Unit shall use 2-inch disposable filter. Unit shall be furnished with enthalpy economizer, barometric relief dampers, and hinged access panels.</p> |       |
| 2    | Split System Air Conditioning Units    | <p>Indoor Unit: Unit includes a chassis, coil, insulation, drain pan assembly, fan, and motor. Unit shall be horizontal, ductless, indoor system with field-installed condensate pump, automatic fan speed control, auto restart after power outage, self-check function, and integral diagnostics. Cabinet is heavy gauge with formed edges and access panels. Cooling coils shall be copper tube with aluminum fins and copper tube connections. All coils shall be burst tested at 450 psig air pressure and leak tested at 100 psig air</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |

|   |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
|---|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|   |                               | <p>pressure under water. The maximum working pressure shall be 300 psig. Fan wheel shall be centrifugal forward curved double width. Fan wheel and housing shall be formed material and corrosion resistant. Fan speed control is automatic. Motors shall be brushless, permanently lubricated, have characteristics as scheduled, and be furnished with integral thermal overload protection. Motors shall be factory run tested and assembled prior to shipping. Controls shall be wall-mounted wireless. Outdoor Unit includes chassis, coil, compressor, refrigerant piping, condenser fan and motor, and controls. Cabinet is heavy gauge galvanized steel with formed edges and access openings for piping and conduit. Compressor is twin rotor with inverter drive. Refrigerant type is R410A. Piping connections are flared. Controls include automatic condenser fan speed control, auto restart after power outage, self-check function, integrated diagnostics, anti-recycle timer, defrost, and low-ambient lock out.</p> |  |
| 3 | Centrifugal Fans              | <p>Fans for ventilation systems serving hazardous areas classified under provisions of Article 500 of NFPA 70 shall be fabricated in accordance with AMCA Type A or Type B spark-resistant construction. Provide centrifugal vent sets. Fan shall be manufactured in an ISO 9001 certified facility. Fan shall be listed by Underwriters Laboratories in conformance with UL 705. Fan shall bear the AMCA Certified Ratings Seal for Sound and Air Performance. The housing shall be able to be rotated in the field to eight discharge positions. Construction shall be bolted and welded utilizing corrosion resistant fasteners. Bearing support shall be 10-gauge welded steel. Fan shall include a weather cover with latched side access inspection ports for the motor compartment. Provide an engrave nameplate indicating fan performance and model number.</p>                                                                                                                                                               |  |
| 4 | Power and Gravity Ventilators | <p>Spun aluminum housing, roof-mounted, belt-driven, upblast centrifugal exhaust</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |

|   |                      |                                                                                                                                                                                                                                                                                                                                                                      |  |
|---|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|   |                      | ventilator. Fan shall be manufactured in an ISO 9001 certified facility. Fan shall be listed by Underwriters Laboratories in conformance with UL 705. Fan shall bear the AMCA Certified Ratings Seal for Sound and Air Performance. Gravity ventilator shall have spun aluminum housing similar to exhaust ventilator.                                               |  |
| 5 | Air Cleaning Devices | Factory fabricated, replaceable, dry, pleated air filters in the, minimum 2" thick, minimum MERV 8 in accordance with ASHRAE Test Standard 52.2-2007. Filters shall be listed as UL 900. Factory-assembled side servicing housings with flanges for insertion into ductwork. Construct of 16-gauge galvanized steel. Provide access doors with continuous gasketing. |  |

**10.5 Ductwork and Appurtenances**

| Item | Parameter            | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Notes |
|------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Ductwork             | <ul style="list-style-type: none"> <li>Construct rigid ducts using ASTM A653M-2003 G90 sheet metal in accordance with recommendations of the ASHRAE Guide, SMACNA 1985 HVAC Duct Construction Standards Metal and Flexible, NFPA 90A, and the California Mechanical Code. Flexible ducts with an exterior reinforced vapor barrier, minimum R = 8.0 insulation, encapsulated steel wire helix, and impervious, smooth, non-perforated interior polymer liner. The maximum length shall be seven feet. Flexible ducts shall be limited to use at the terminal ends of the duct system only. Flexible ducts shall conform to UL-181.</li> <li>Ducts for odor control ventilation shall be FRP.</li> </ul> |       |
| 2    | Ductwork Accessories | Round ducts and rectangular ducts with maximum dimension 16" or smaller shall have butterfly type balancing damper with quadrant locks, fabricated according to SMACNA standards. Rectangular ducts with maximum dimension greater than or equal to 17" shall have opposed blade configuration with quadrant locks. Provide                                                                                                                                                                                                                                                                                                                                                                             |       |

|   |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                              |
|---|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
|   |                        | flexible connections and sunshields (if outdoor) for each duct connection to a piece of equipment.                                                                                                                                                                                                                                                                                                                                                                               |                                              |
| 3 | Air Outlets and Inlets | Construct with steel backpans and removable perforated steel faces, and compatible with the ceiling system in which installed. Diffusers shall be equipped with four cores consisting of pattern control vanes that individually pivot to adjust air pattern from horizontal to vertical. The air pattern can be adjusted further by rotating the cores in the field to provide a 1-way, 2-way, 3-way, or 4-way air pattern. Provide volume dampers in the necks of the devices. | Provide plastic materials in corrosive areas |

**10.6 Mechanical Controls and Monitoring**

| Item | Parameter  | Criteria                                                                                                                                                                                                                                                                                                                                                                    | Notes |
|------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Controls   | Controls shall be based on digital equipment and shall monitor and control space temperature and/or space humidity to maintain indoor temperatures within the ranges established in the design criteria.                                                                                                                                                                    |       |
| 2    | Setpoints  | Setpoints shall be adjustable by occupants but shall be limited within a range determined by the City                                                                                                                                                                                                                                                                       |       |
| 3    | Monitoring | All continuously operating ventilation systems serving WRF processes shall include flow detector devices connected to alarm signaling systems to indicate inadequate ventilation and ventilation system failure. The flow detection devices shall monitor both the supply and exhaust fans. Distinct local and remote alarms shall be provided in accordance with NFPA 820. |       |

**10.7 Startup, Commissioning, and Testing**

| Item | Parameter | Criteria                                                                                                                                                             | Notes |
|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 1    | Startup   | Startup for all equipment addressed by this section is required. Startup shall be performed by factory trained technicians and shall address all requirements in the |       |

|          |                                   |                                                                                                                                                                                                                                                                                 |  |
|----------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|          |                                   | manufacturers' installation and startup documentation.                                                                                                                                                                                                                          |  |
| <b>2</b> | Commissioning                     | Commissioning is required for all HVAC systems addressed by this section. Requirements for system commissioning shall be based on the guidelines established by ASHRAE 202-2013.                                                                                                |  |
| <b>3</b> | Testing                           | Testing required by codes, referenced standards, and installation instructions shall be performed in accordance with those requirements                                                                                                                                         |  |
| <b>4</b> | Testing, Adjusting, and Balancing | Testing, adjusting, and balancing of all equipment and HVAC systems addressed by this section is required. Work shall be in accordance with the 7th Edition of the AABC National Standards for Total System Balance and the requirements of ASHRAE Standard 111-2008 (RA 2017). |  |

**SECTION 11 DEMOLITION AND REMOVAL OF EXISTING WWTP**

**11.1 General**

The DB shall be responsible for the sequencing and coordination of the shutdown and demolition of the existing WWTP. The DB shall conduct a planning meeting with the City of Morro Bay and the Cayucos Sanitary District (CSD) and then prepare and submit a shutdown and demolition plan to the City of Morro Bay for review and approval. The existing 5.7-acre WWTP must remain in full operation until the new WRF is in full operation and the collection system is no longer delivering flow to the WWTP from the City of Morro Bay or the CSD. CSD is currently pursuing a new wastewater treatment facility. It is assumed the self-contained electronic and household hazardous waste collection facility operated by the San Luis Obispo Integrated Waste Management Association (IWMA) will be relocated by the IWMA prior to the demolition of the WWTP. The City of Morro Bay has completed lead and asbestos analyses of the existing WWTP. The lead testing report is included in Appendix K of this document. The asbestos testing report is included in Appendix L of this document. Additional information regarding existing WWTP facilities is available in the City’s Draft Water Reclamation Facility Master Plan available on the project website (morrobaywrf.com).

**11.2 Decommissioning and Demolition**

Once influent has ceased in the liquid treatment train, City plant operators will take processes out of service. DB will empty and clean the existing basins and process units. Liquid from the treatment train may be conveyed to the new WRF. After the remaining sludge is processed the DB shall empty and clean the digesters and sludge drying beds. Waste from the digester shall be screened to ¼-inch, dewatered, and disposed of at an appropriate facility. Filtrate from dewatering may be transferred to the WRF.

The decommissioning of the existing WWTP will include the shutdown, demolition and complete removal of all WWTP facilities. Only piping below 6 feet in depth may remain. The DB may abandon in place piping deeper than 6 feet and fill it with a low strength cement slurry. After demolition and removal, the DB shall backfill, compact and regrade the site leaving the site cleared, clean and available for other purposes. The DB’s regrading shall fit the basic drainage pattern of the surrounding facility and be surfaced with a 1” layer of gravel.

The following table lists all the structures to be demolished and removed by the DB from the existing WWTP site. The outfall air release structure, outfall piping, and related junction box(es) used for the WRF and the new CSD treatment facility are expected to remain.

| Existing WWTP Structures to be Demolished              |                                |
|--------------------------------------------------------|--------------------------------|
| Administration Building                                | Chlorine Building/Storage Room |
| Primary Sedimentation Tanks                            | Chlorine Contact Tank          |
| Biofilter Pump Station & Motor Control Center Building | Digesters                      |
| Biofilters                                             | Maintenance Building           |
| Secondary Sedimentation Tank                           | Hydropneumatic Tank            |
| Secondary MCC Building                                 | Waste Gas Burner               |
| Sludge Drying Beds                                     | Collection Shed                |

**11.3 Disposal**

The DB will either salvage or dispose of all materials in appropriately classed landfills. Demolition rubble will be disposed of at a nearby Class 3 landfill , while hazardous waste will be transported to a Class 1 or Class 2 landfill.

**SECTION 12 FACILITY STARTUP AND COMMISSIONING AND TRANSFER OF OPERATIONS****12.1 General**

Equipment testing and startup are required for satisfactory completion of the construction phase of the contract and therefore shall be completed prior to operation of the facility.

**12.2 Definitions**

For purposes of facility startup and commissioning, the following definitions shall apply:

- *Manufacturer's Representative*: Employee of manufacturer who is factory trained and knowledgeable in the technical aspects of the products and systems.
- *Functional Testing*: Tests necessary to demonstrate that the installed equipment and systems function as specified and operate in the manner intended.
- *Startup Period*: Startup of any portion of the entire facility will be considered complete when the facility or designated portion has properly operated 2 weeks without interruption. This period is in addition to any specified functional or performance testing and training.
- *Acceptance Testing*: The operation of the entire facility to demonstrate the successful operation and integration of all the elements including ancillary systems.
- *Performance and Operation Testing*: The operation of the entire facility to demonstrate the facility's ability to meet performance requirements of the RFP, design documents generated by the DB, and finally to verify the performance guarantees submitted by the DB.

**12.3 Facility Testing Plan**

The DB shall organize and conduct a meeting to coordinate the development of the factory acceptance tests, manufacturers installation certification, functional tests, performance testing, and 6-month operational verification plan. The meeting must have participation from manufacturers' representatives, the City, and DB. After the planning meeting but no later than 3 months prior to the acceptance testing, the DB shall submit a draft Facility Testing Plan to the City. The Facility Testing Plan shall include the Functional Testing plan, the Acceptance Testing plan, and the Performance and Operation Testing plan. All permit-required confirmation testing shall be done by a third-party ELAP certified lab, to be paid for by the DB during the acceptance testing period. The DB shall submit the results of each testing program.

All testing plans and protocols shall define the procedures to be used, methods to verify compliance with the performance criteria, and include the following minimum components:

- The specific measurements that will be made, including identification of permanent and temporary measurement devices
- Calibration procedures for measuring devices
- Redundancy of any measuring device to demonstrate accuracy
- Organization of the testing team, including responsibilities
- The testing program and schedule
- Operations and maintenance schedule during the test period
- Specific detailed sampling protocols to be used in conducting the acceptance test

- Include testing plan to conduct all necessary facility and system performance tests to meet DDW and Title 22 testing and reporting requirements for GRRP's using subsurface application
- The quantities of influent that will be used and selected equipment that will demonstrate the capability of equipment to handle the design flows

#### **12.4 Functional Testing**

- The DB shall furnish the services of a manufacturer's representative for each piece of major equipment, to inspect, to check, and to adjust, if necessary, the equipment installation. In each case, the DB shall arrange to have the manufacturer's representative revisit the project site as often as necessary until any issues have been corrected, and the equipment installation and operation is acceptable to the manufacturer's representative. The DB shall conduct, with the assistance of the manufacturer's representative, startup and field tests on equipment, systems, and subsystems.
- Functional testing shall be required for all mechanically or electrically operated equipment and process systems, including but not limited to mechanical, electrical, instrumentation, and controls. Functional testing shall also be required for all control equipment and meters. Testing shall include checking for proper rotation, alignment, speed excessive vibration, quiet operation, and full capability of all other required functions. The DB shall perform initial equipment and system adjustments and calibrations in the presence and with the assistance of the manufacturer's representative.
- The DB shall furnish the manufacturer's representative a written report certifying that the equipment has been properly installed and lubricated, is in accurate alignment, is free from any undue stress imposed by connecting piping or anchor bolts, and has been operated satisfactorily under full-load conditions.
- The DB shall schedule all manufacturer certification testing. The manufacturer's representative and the operating personnel and the owner's representative will witness manufacturer certification testing.

#### **12.5 Acceptance Testing**

- The acceptance test shall demonstrate the ability of the WRF to meet contract requirements.
- After all certification, functional and equipment tests have been performed and all equipment has successfully met startup requirements, the facility shall be operated as a complete system for two weeks prior to entering the Transitional Operation Phase.
- The acceptance test shall not be conducted until the acceptance test plan is approved by the City and Regulatory agencies, and authorization is received from the City. The acceptance test plan shall describe the provisions for disposal of non-compliant effluent that may be generated during the execution of the acceptance test.
- All labor (excluding certified operators), materials, and equipment necessary to perform the acceptance test shall be provided by the DB. Once the facility is treating wastewater, the City will provide certified operators. During the acceptance test, the DB will operate, and be responsible for all costs for all systems under normal operating conditions, including but not limited to, routine equipment operation, maintenance services, and chemicals. Electricity will be paid by the City.
- The acceptance test shall also demonstrate the WRF's ability to operate on the emergency generator, in the event of total plant power failure, including automatic transfer to the emergency

generator. The system should demonstrate that the quality of effluent, and capability to process the influent is not diminished due to an automatic transfer to the emergency generator.

- The acceptance test should demonstrate the UPS for power and controls performing without loss of data and control.
- The acceptance test shall demonstrate manual shutdown, manual start-up, automatic shutdown, automatic start-up, and automatic transfer of equipment that requires any or all of those functions, without interruption of flow, or quality of effluent.
- Acceptance test shall include all necessary facility and system performance tests to meet DDW and Title 22 testing and reporting requirements for GRRP's using subsurface application.
- The City operational staff and owner's representative will witness acceptance testing. The City will provide at least one operator for eight hours per day, during the acceptance test period.
- The DB shall provide reports in accordance with the requirements of the regulatory agencies, with certification of the results demonstrating performance, all relevant data measured and recorded during the testing, and any calculations that were used in determining test results, and any certifications from equipment manufacturers that equipment was operated according to manufacturer's recommendations, any other available documentation reasonably requested by the City or regulatory agencies.
- DB shall provide initial oil fill and first oil change on all equipment as required by manufacturers recommendations prior to the facility transfer to City for Performance and Operation Testing.

## **12.6 Performance and Operation Testing**

- After all startup, certification, functional, and acceptance testing is complete the performance and operational testing of the WRF as a whole system will commence. The purpose of the testing is to demonstrate the ability of the equipment and fully integrated system to meet the performance requirements as identified in the RFP, meet manufacturers specifications, design documents generated by the DB, and finally to verify the performance guarantees submitted by the DB.
- The performance and operations testing will be conducted by the City at the direction of the DBs representative in accordance with the approved performance and operations plan.
- All labor, materials, and equipment necessary for the performance and operation testing shall be provided by the City. During performance and operation testing the City is responsible for all costs for all systems under normal operating conditions, including but not limited to routine equipment operation, maintenance services, and chemical and electric usage. During performance and operation testing DB will be responsible for all warranty repairs. DB is responsible for any costs associated with permit violations.
- The Performance and Operational Testing period shall be 6 months in duration. The City reserves the right to extend the performance and operation testing period upon a failure to reach the performance guarantees.

**SECTION 13 SECURITY****13.1 General**

Provide a security system that gives the City the ability to remotely monitor key areas within the site and notify the City of any intrusions. The completed security system shall be integrated with the City's SCADA system.

| Item | Parameter                        | Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Notes                                                                             |
|------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| 1    | Construction/Work Area           | Make adequate provision for the protection of the work area against fire, theft, and vandalism, and for the protection of the public against exposure to injury                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                   |
| 2    | General Design Principles        | <ul style="list-style-type: none"> <li>Discrete security measures shall be planned into the facility</li> <li>Site design shall address security issues related to access control; electronic protection; and protection against man-made and natural disasters</li> <li>Security measures shall be consistent with Department of Homeland Security (DHS) Best Management Practices (BMPs)</li> </ul>                                                                                                                                                                                              |                                                                                   |
| 3    | Security Measures                | Intrusion detection, access control and CCTV video surveillance system security zoning shall provide a defensible perimeter and provide visual surveillance and defensible perimeter space to deter trespassing and vandalism                                                                                                                                                                                                                                                                                                                                                                      | Do not monitor perimeter fence integrity i.e. cut wire or short circuit detection |
| 4    | Intrusion Detection System (IDS) | <ul style="list-style-type: none"> <li>An IDS shall be provided. IDS field devices shall be connected to alarm panel. Alarm signals shall be relayed and integrated with SCADA system.</li> <li>Provide IDS devices on all exterior doors on Operations and Maintenance Buildings.</li> <li>Provide motion detectors on interior of Operations and Maintenance Buildings.</li> <li>Provide IDS with capability of assigning unique staff identification numbers and logging time and individual staff input to IDS system. Provide ability to activate and inactivate unique staff IDs.</li> </ul> |                                                                                   |
| 5    | Access Control System (ACS)      | <ul style="list-style-type: none"> <li>An ACS at the gate to the non-public portions of the plant shall be comprised of an electrically operated vehicle gate, the gate shall be operated by</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                            | Fire Department access and keypad entry station shall be                          |

|   |                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                  |

## CITY OF MORRO BAY

### AGREEMENT FOR CONSULTANT SERVICES

THIS AGREEMENT is made, by and between, the City of Morro Bay, a municipal corporation (“City”) and Water Works Engineers, LLC, an Arizona Limited Liability Company (“Consultant”). In consideration of the mutual covenants and conditions set forth herein the parties agree as follows:

1. TERM

This Agreement shall commence on November 15, 2017, and shall remain and continue in effect until tasks described herein are completed, but in no event later than March 30, 2022, unless sooner terminated pursuant to the provisions of this Agreement.

2. SERVICES

Consultant shall perform the tasks described and set forth in Exhibit A, attached hereto and incorporated herein as though set forth in full. Consultant shall complete the tasks according to the schedule of performance which is also set forth in Exhibit A.

3. PERFORMANCE

Consultant shall at all times faithfully, competently and to the best of their ability, experience, and talent, perform all tasks described herein. Consultant shall employ, at a minimum, generally accepted standards and practices utilized by persons engaged in providing similar services as are required of Consultant hereunder in meeting its obligations under this Agreement.

4. CITY MANAGEMENT

City’s Public Works Director shall represent City in all matters pertaining to the administration of this Agreement, review and approval of all products submitted by Consultant, but not including the authority to enlarge the Tasks to Be Performed or change the compensation due to Consultant. City’s City Manager shall be authorized to act on City’s behalf and to execute all necessary documents which enlarge the Tasks to Be Performed or change Consultant’s compensation, subject to Section 5 hereof.

5. PAYMENT

(a) City agrees to pay Consultant monthly, in accordance with the payment rates and terms and the schedule of payment as set forth in Exhibit A, attached hereto and incorporated herein by this reference as though set forth in full, and based upon actual time spent on the above tasks. That amount shall not exceed One Million, Three Hundred Fifty Three Thousand, Five

Hundred Seventy-Four Dollars and No Cents (\$1,353,574.00) for the total term of the Agreement unless additional payment is approved as provided in this Agreement.

(b) Consultant shall not be compensated for any services rendered in connection with its performance of this Agreement which are in addition to those set forth herein, unless such additional services are authorized in advance and in writing by the City Manager. Consultant shall be compensated for any additional services in the amounts and in the manner as agreed to by City Manager and Consultant at the time City's written authorization is given to Consultant for the performance of said services. The City Manager may approve additional work not to exceed ten percent (10%) of the amount of the Agreement, but in no event shall such sum exceed One Hundred Thirty Five Thousand Three Hundred Fifty Seven Dollars and No Cents (\$135,357). Any additional work in excess of this amount shall be approved by the City Council.

(c) Consultant will submit invoices monthly for actual services performed. Invoices shall be submitted on or about the first business day of each month, or as soon thereafter as practical, for services provided in the previous month. Payment shall be made within thirty (30) days after receipt of each invoice as to all non-disputed fees. If City disputes any of Consultant's fees, then it shall give written notice to Consultant within fifteen (15) days of receipt of an invoice of any disputed fees set forth on the invoice.

#### 6. SUSPENSION OR TERMINATION OF AGREEMENT WITHOUT CAUSE

(a) City may at any time, for any reason, with or without cause, suspend or terminate this Agreement, or any portion hereof, by serving upon Consultant at least ten-days' (10-days') prior written notice. Upon receipt of said notice, Consultant shall immediately cease all work under this Agreement, unless the notice provides otherwise. If City suspends or terminates a portion of this Agreement, then such suspension or termination shall not make void or invalidate the remainder of this Agreement.

(b) In the event this Agreement is terminated pursuant to this Section, City shall pay to Consultant the actual value of the work performed up to the time of termination. Upon termination of the Agreement pursuant to this Section, Consultant will submit an invoice to City pursuant to Section 5.

#### 7. DEFAULT OF CONSULTANT

(a) Consultant's failure to comply with the provisions of this Agreement shall constitute a default. In the event Consultant is in default for cause under the terms of this Agreement, City shall have no obligation or duty to continue compensating Consultant for any work performed after the date Consultant is notified of default and can terminate this Agreement immediately by written notice to Consultant. If such failure by Consultant to make progress in the performance for work hereunder arises out of causes beyond Consultant's control, and without fault or negligence of Consultant, then it shall not be considered a default.

(b) If the City Manager or his/her delegate determines that Consultant is in default in the performance of any of the terms or conditions of this Agreement, then he/she shall cause to be

served upon Consultant a written notice of the default. Consultant shall have ten (10) days after service upon it of said notice in which to cure the default by rendering a satisfactory performance. In the event that Consultant fails to cure its default within such period of time, City shall have the right, notwithstanding any other provision of this Agreement, to terminate this Agreement without further notice and without prejudice to any other remedy to which it may be entitled at law, in equity or under this Agreement.

## 8. OWNERSHIP OF DOCUMENTS

(a) Consultant shall maintain complete and accurate records with respect to sales, costs, expenses, receipts, and other such information required by City that relate to the performance of services under this Agreement. Consultant shall maintain adequate records of services provided in sufficient detail to permit an evaluation of services. All such records shall be maintained in accordance with generally accepted accounting principles and shall be clearly identified and readily accessible. Consultant shall provide free access to the representatives of City or its designees at reasonable times to such books and records; shall give City the right to examine and audit said books and records; shall permit City to make transcripts therefrom as necessary; and shall allow inspection of all work, data, documents, proceedings, and activities related to this Agreement. Such records, together with supporting documents, shall be maintained for a period of three (3) years after receipt of final payment.

(b) Upon completion of, and full payment by City for services performed pursuant to, this Agreement, all final work product such as documents, designs, drawings, maps, models, computer files, surveys, notes, and other documents prepared in the course of providing the services to be performed pursuant to this Agreement shall become the sole property of City and may be used, reused, or otherwise disposed of by City without the permission of Consultant. With respect to computer files, Consultant shall make available to City, as a service in addition to those set forth herein, at Consultant's office and upon reasonable written request by City, the necessary computer software and hardware for purposes of accessing, compiling, transferring, and printing computer files.

## 9. INDEMNIFICATION

(a) Indemnification for Professional Liability. When the law establishes a professional standard of care for Consultant's Services, to the fullest extent permitted by law, Consultant shall indemnify, protect, defend and hold harmless City and any and all of its officials, employees and agents ("Indemnified Parties") from and against any and all losses, liabilities, damages, costs and expenses, including reasonable attorney's fees and costs to the extent same are caused by any negligent act, error or omission of Consultant, its officers, agents, employees or subconsultants (or any entity or individual that Consultant shall bear the legal liability thereof) in the performance of professional services under this agreement. City agrees to hold harmless and indemnify Consultant from and against all claims, liabilities, losses, damages, and costs, including but not limited to attorney's fees, arising out of or in any way connected with the modification, misinterpretation, misuse or reuse by others of the computer files or any other document provided by Consultant under this Agreement.

(b) Indemnification for Other Than Professional Liability. Other than in the performance of professional services and to the full extent permitted by law, Consultant shall indemnify, defend and hold harmless City, and any and all of its employees, officials and agents from and against any liability (including liability for claims, suits, actions, arbitration proceedings, administrative proceedings, regulatory proceedings, losses, expenses or costs of any kind, whether actual, alleged or threatened, including attorneys' fees and costs, court costs, interest, defense costs, and expert witness fees), where the same arise out of, are a consequence of, or are in any way attributable to, in whole or in part, the performance of this Agreement by Consultant or by any individual or entity for which Consultant is legally liable, including but not limited to officers, agents, employees or subconsultants of Consultant.

(c) General Indemnification Provisions. Consultant agrees to obtain executed indemnity agreements with provisions identical to those set forth here in this section from each and every subconsultant or any other person or entity involved by, for, with or on behalf of Consultant in the performance of this agreement. In the event Consultant fails to obtain such indemnity obligations from others as required here, Consultant agrees to be fully responsible according to the terms of this section. Failure of City to monitor compliance with these requirements imposes no additional obligations on City and will in no way act as a waiver of any rights hereunder. This obligation to indemnify and defend City as set forth here is binding on the successors, assigns or heirs of Consultant and shall survive the termination of this agreement or this section.

#### 10. INSURANCE

Consultant shall maintain prior to the beginning of and for the duration of this Agreement insurance coverage as specified in Exhibit B attached to and part of this agreement.

#### 11. INDEPENDENT CONSULTANT

(a) Consultant is and shall at all times remain as to City a wholly independent Consultant. The personnel performing the services under this Agreement on behalf of Consultant shall at all times be under Consultant's exclusive direction and control. Neither City nor any of its officers, employees, or agents shall have control over the conduct of Consultant or any of Consultant's officers, employees, or agents, except as set forth in this Agreement. Consultant shall not at any time or in any manner represent that it or any of its officers, employees, or agents are in any manner officers, employees, or agents of City. Consultant shall not incur or have the power to incur any debt, obligation, or liability whatever against City, or bind City in any manner.

(b) No employee benefits shall be available to Consultant in connection with the performance of this Agreement. Except for the fees paid to Consultant as provided in the Agreement, City shall not pay salaries, wages, or other compensation to Consultant for performing services hereunder for City. City shall not be liable for compensation or indemnification to Consultant for injury or sickness arising out of performing services hereunder.

12. LEGAL RESPONSIBILITIES

Consultant shall keep itself informed of State and Federal laws and regulations which in any manner affect those employed by it or in any way affect the performance of its service pursuant to this Agreement. Consultant shall at all times observe and comply with applicable legal requirements in effect at the time the drawings and specifications are prepared. City, and its officers and employees, shall not be liable at law or in equity occasioned by failure of Consultant to comply with this Section.

13. UNDUE INFLUENCE

Consultant declares and warrants that no undue influence or pressure is used against or in concert with any officer or employee of City in connection with the award, terms or implementation of this Agreement, including any method of coercion, confidential financial arrangement, or financial inducement. No officer or employee of City will receive compensation, directly or indirectly, from Consultant, or from any officer, employee or agent of Consultant, in connection with the award of this Agreement or any work to be conducted as a result of this Agreement. Violation of this Section shall be a material breach of this Agreement entitling City to any and all remedies at law or inequity.

14. NO BENEFIT TO ARISE TO LOCAL EMPLOYEES

No member, officer, or employee of City, or their designees or agents, and no public official who exercises authority over or responsibilities with respect to the Project during his/her tenure or for one year thereafter, shall have any interest, direct or indirect, in any agreement or sub-agreement, or the proceeds thereof, for work to be performed in connection with the Project performed under this Agreement.

15. RELEASE OF INFORMATION/CONFLICTS OF INTEREST

(a) All information gained by Consultant in performance of this Agreement shall be considered confidential and shall not be released by Consultant without City's prior written authorization. Consultant, its officers, employees, agents, or subconsultants, shall not without written authorization from the City Manager or unless requested by the City Attorney, voluntarily provide declarations, letters of support, testimony at depositions, response to interrogatories, or other information concerning the work performed under this Agreement or relating to any project or property located within City. Response to a subpoena or court order shall not be considered "voluntary" provided Consultant gives City notice of such court order or subpoena.

(b) Consultant shall promptly notify City if Consultant, or any of its officers, employees, agents, or subconsultants are served with any summons, complaint, subpoena, notice of deposition, request for documents, interrogatories, request for admissions, or other discovery request, court order, or subpoena from any person or party regarding this Agreement and the work performed thereunder or with respect to any project or property located within City. City retains the right, but has no obligation, to represent Consultant or be present at any deposition, hearing, or similar proceeding. Consultant agrees to cooperate with City by providing the

20. ENTIRE AGREEMENT

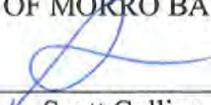

This Agreement contains the entire understanding between the parties relating to the obligations of the parties described in this Agreement. All prior or contemporaneous agreements, understandings, representations, and statements, oral or written, are merged into this Agreement and shall be of no further force or effect. Each party is entering into this Agreement based solely upon the representations set forth herein and upon each party's own independent investigation of any and all facts such party deems material.

21. AUTHORITY TO EXECUTE THIS AGREEMENT

The person or persons executing this Agreement on behalf of Consultant warrants and represents he/she has the authority to execute this Agreement on behalf of Consultant and has the authority to bind Consultant to the performance of its obligations hereunder.

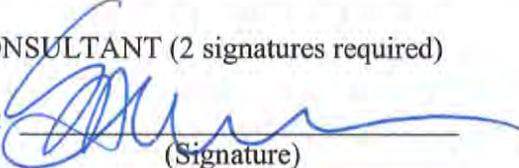

IN WITNESS WHEREOF, the parties hereto have caused this Agreement to be executed the day and year first above written.

## ASSUMPTIONS

The following assumptions have been made in the development of this scope and fee. Additional Task Orders would be required to perform any of the work which is not listed in this scope or has been specifically identified as out of scope in the assumptions below:

1. Environmental Permitting assumptions: This project is covered under the WRF project specific Environmental Impact Report (EIR). ENGINEER will support CITY in limited areas of EIR development, however, no special studies or CEQA document preparation is included in this scope of work except as specifically delineated.
2. Special Use and Building Permitting assumptions: ENGINEER will develop plans and technical specifications in accordance with design criteria developed and delineated during preliminary and final design with input from City staff. 100% design submittal shall be used by City to acquire special use and/or building permits, as required by City and other 3<sup>rd</sup> party building officials and/or stakeholders. ENGINEER shall rely on City to identify and assist with scheduling a review meeting with the building and permitting officials to address 100% design submittal review comments (if any) from those officials. The cost of building permits will be paid for by City and all permits will be applied for with City as the applicant. If re-submittal for building department approval is required, Final Bid Documents shall be used for this purpose and shall address building review comments. Re-submittals to address new comments (if any) on Final Bid Documents shall be considered additional services.
3. Geotechnical, surveying and potholing assumptions: These services have been scoped in this project based on preliminary site and alignment alternatives. Should the preferred site and/or alignment require additional survey, field potholing and geotechnical investigations beyond those defined herein, those shall be completed as additional services.
4. Project Funding assumptions: City is handling all project funding. If a project funding source has specific contractual requirements, City shall inform ENGINEER and ENGINEER will address those requirements in the development of the design. ENGINEER shall assume funding will be provided by the State Revolving Fund and/or WIFIA programs. City also intends to pursue a United States Bureau of Reclamation WaterSmart grant.
5. Project Bid Packaging assumptions: The project will be packaged as one project (WRF LS and Pipelines). Splitting the project into multiple bid packages shall be considered additional services.
6. Engineering Services During Construction assumptions: The duration of construction and level of on-site Engineering Services During Construction specifically defined in the scope will be adequate for all parties (accommodating Contractor schedule, Regulatory Agency requirements, City requirements, etc.). Additional project duration or requirements for Services During Construction will require additional scope. This scope of services assumes that Construction Management Services (Quality Control, Inspection and documentation of construction, Contract Management, Negotiations and Payment of Change Orders, Contractor correspondence coordination, etc.) will be provided separately by City personnel, under a separate consultant services agreement, or as an additional service to this consultant services agreement.

## SCOPE

The following services will be provided by CONSULTANT:

| Task | Title                                             |
|------|---------------------------------------------------|
| 1    | Project Management                                |
| 2    | Site Alternatives Evaluation                      |
| 3    | Easement Acquisition Support                      |
| 4    | Survey, Geotechnical Investigation, and Potholing |
| 5    | Concept Design Report                             |
| 6    | Construction Documents and Specifications         |
| 7    | Permitting Support                                |
| 8    | Engineering and Services during Construction      |

## Task 1: Project Management

Water Works Engineers will be responsible for providing project management and quality control for the services described herein. The following outline describes the services that will be provided under this task:

1. Project Communication and Control
  - A. Coordination/documentation of key team activities & meetings, including agenda and meeting notes
  - B. Coordination and consultation with appropriate regulatory agencies (Caltrans,
  - C. Coordination and consultation with project stakeholders (City, WRF/CAC, City Council, Caltrans, PG&E)
  - D. Schedule maintenance
  - E. Monthly communication of project progress and issues to City staff / WRF Program Manager
    - Summary of work accomplished each month
    - Description of current / future activities and schedule update for each task/sub-task
    - Identification of problem areas and corrective actions
    - Invoice showing total contract, invoice amounts, cumulative amounts and remaining budget, as well as the following:
      - Hours billed by individual Water Works staff member for the billing period, including dates.
      - Subconsultant invoices.
      - Receipts for direct costs.
    - Invoice shall be submitted within 90 days of work being performed, unless authorized by PM team or City in advance. It is understood that services provided by Water Works subconsultants will be billed as expeditiously as possible, but in some instances, may be delayed based on receipt of invoice for completed work. The City operates and manages budget based on their fiscal year, so an invoice that covers all ENGINEER's remaining expenses through the end of the City's fiscal year (June 30) will be required within 60 days of the end of the fiscal year.
  - F. Availability to City staff for meetings, updates or to discuss concerns at any time
  - G. Communication and file maintenance
    - Standardized electronic and hard copy file maintenance by entire WWE team
    - Water Works will promote communication and exchange of files, including use of City's Procore project management system.
      - City will provide Water Works access to Procore
2. Quality Assurance/Quality Control
  - A. Assign QA/QC Manager for project – Sami Kader
  - B. Develop and implement project specific work plan with the entire project team, including Water Works Engineers Quality Assurance/Quality Control Policy
  - C. Ensure QA/QC procedures are being followed, recorded and reported to the City at each step in the design process
3. Facilitation of progress / coordination meeting with City staff and WRF Program Manager. Drafts of all major deliverables will be reviewed with the CLIENT at Workshops. Following the Workshop, comments from the CLIENT will be addressed and the document made FINAL and delivered to CLIENT.
  - A. Kick-off Meeting
  - B. Alternatives Site Analysis Workshop (coordinated with pertinent Task 2 workshops)
  - C. Route Study / Lift Station Site Selection Review Workshop (coordinated with Task 2 workshops)
  - D. Design Confirmation Meeting (coordinated with pertinent Task 2 workshops)
  - E. Concept Design Report Workshop
  - F. 60% Design Submittal Review Workshop
  - G. 90% Design Review Workshop
4. Presentation to Public Entities  
ENGINEER will submit draft presentation materials to City staff / Program Manager one week prior to presentation date. Mutually agreed upon revisions will be incorporated and final documents produced.
  - A. WRF/CAC (Qty. 2)
  - B. City Council (Qty. 2)
  - C. City Planning Commission (LS architecture) (Qty. 2)

## Task 2: Site Alternatives Evaluation

WWE will conduct a series of focused, topic-specific workshops in the development of the Site Alternatives Assessment. These workshops will not have specific deliverables, but are intended to be information gathering and detailed discussion meetings regarding each topic. At the City's option, several workshop topics can be combined into a single workshop. However, breaking up these topics is our proposed approach to keep workshops relatively short and make best use of time. The proposed workshops are as follows:

1. Workshop 1: Site Alternatives, Pipeline Routes and Construction Methodology Review
  - A. WRF LS Sites Confirmation
    - i. WRF MP Site 1A
    - ii. WRF MP Site 5A
  - B. Pipeline Route Alternatives Confirmation
    - i. WRF MP "west" Alignment
    - ii. Modified "west" alignment along Embarcadero to by-pass Quintana / Morro Bay Blvd
2. Workshop 2: Hydraulics, WRF Master Plan Design Criteria Review and Modifications
  - A. Detailed review of flow analyses from the WRF MP to confirm Peak Hour Flow and Peak Day Flow to ensure "feasible" alternatives are vetted and potential savings identified and realized in design.
  - B. Wetwell Design, Pump Type and Quantity (3+1 same size or 2+1 Wet & 1+1 Dry or other arrangements as deemed appropriate by ENGINEER and City)
    - i. Example 3D "Rotators" of similar station layouts
  - C. Pipeline Design, Size and Quantity (single versus redundant / pressurized & gravity segments)
3. Workshop 3: Desktop Geotechnical Evaluation and Trenchless Feasibility, Pipeline Route Fatal Flaws
4. Workshop 4: Environmental Constraints and EIR Support Review and Confirmation
5. Workshop 5: Pipeline Route Analysis
  - A. Discussion of pipeline route constraints:
    - i. Accessibility / O&M
    - ii. Constructability / Traffic Impacts
    - iii. Construction Method
    - iv. Environmental / Permitting
    - v. Utility Coordination
    - vi. Right-of-Way / Easement / Encroachment
    - vii. Geotechnical
    - viii. Key stakeholder coordination
    - ix. Other identified constraints
  - B. Project Location (Map of project location and key areas of concern)
  - C. Project Hydraulics (System design flows, peaking factors, dry weather versus wet weather, cleaning velocities, hydraulic profile, maximizing capacity versus minimizing depth, etc.);
  - D. Pipeline Planning (Connections/transition between existing and new pipe segments, alignment, pipe materials, trenchless versus traditional construction – with emphasis on congested areas, transportation crossings, and deep segments, etc.);
  - E. Construction standards and project delivery (review City standards and if deemed necessary possible modifications required, etc.);
  - F. Schedule confirmation (confirm critical path items, Environmental processing, encroachment permit processing, Right-of-Way procurement, etc.);
  - G. Confirm stakeholders (City, gas pipe operators, Caltrans, etc.) design requirements, discuss key areas of concern, and requirements of specific areas (bike path behind power plant, creek, roundabout, Hwy 1, etc.);
  - H. Analysis Methodology and Results
    - i. "Hard" Construction Costs (25% contingency level)
    - ii. "Soft" Constraint Costs
6. Workshop 6: Pump Selections Discussion and General Mechanical Layout
  - A. Updated DRAFT 3D "Rotators" of station layouts

7. Workshop 7: Control Building Architectural, Odor Control, Back-Up Power, Aesthetics
  - A. Draft visual simulations of building produced and delivered at this workshop
  - B. Final Draft visual simulation of building will be prepared under Task 5 in Design Concept Report.
  - C. FINAL visual simulation of building will be based on Final Design and produced under Task 6.
8. Workshop 8: Operations Planning (Bypass System, Pump and Electrical System Redundancy, Pigging, etc.)
9. Workshop 9: Electrical Systems, Local Controls and SCADA
10. Workshop 10: Construction Sequencing

Workshop presentations shall be a succinct, clear, and concise with alternatives and resultant design criteria presented as PowerPoint slides to the City at the Workshop. Water Works will field and address City questions and comments during the workshop. Discussion and decisions made at the Workshop(s) will serve several key functions as follows:

1. Identify all engineering issues and constraints and recommended resolutions;
2. Provide detailed guidance for effective and efficient execution of preliminary and final design;
3. Illustrate tie-in requirements and expectations so City can confirm;
4. Calculate cost estimations for each alternative (including both "hard" construction costs and "soft" non-construction constraint costs);
5. Coordinate environmental constraints and requirements into site assessment and route selection;
6. Confirm field studies and analysis included in scope of services is sufficient to provide design criteria for Final Design of preferred lift station and pipeline alternatives; and
7. Provide a detailed guidance on any permit, encroachment, right-of-way, easement requirements.

The resulting information gathered from the workshops, supported with select field investigations and office evaluations (Tasks 3 & 4) will be used to produce draft and final Concept Design Report (Task 5).

Task 2 Deliverables:

- ✓ Workshop PowerPoint (or similar electronic deliverable), workshop summary notes and decision log (15 copies of final work products and PDF electronic copy)

### **Task 3: Easement Acquisition Support**

WWE will provide property rights procurement support for the Project. For the CLIENT to complete the proposed sewer project permanent easement (PE), temporary construction easement (TCE), and access rights (right of entry, ROE) must be acquired from several separate parcels. Water Works and our survey Subconsultant, Praxis Consolidated International, Inc., will assist with easement and property rights research; preparation of schematics, maps and descriptions necessary for the City's acquisition agent to complete notice, appraisal, negotiation and easement procurement.

1. Preliminary Title Report(s)

Praxis Consolidated International, Inc. will obtain preliminary title reports as soon possible for the following assessor parcels to identify existing easements, leases, and other encumbrances that may affect the alignment of the pipeline. Most the proposed pipeline route(s) appear to be in existing public road right of way. Small portions of the proposed lift station and pipeline route will affect about eight parcels. Praxis will obtain Preliminary Title Reports (PTR) from a local title company that will cover the affected parcels. Review PTR to confirm ownership information and plot exception items to evaluate possible impact on design and right of way acquisition. The intent of this work is to identify potential significant delays related to easement procurement (potentially "fatal flows") for final design. The WRF MP "west" route assumes the pipeline(s) will follow a bike path after crossing the creek near the City ballfields. Preliminary analysis indicates the underlying property is owned by the power plant company and City ownership of an existing easement or other agreement for the bike path may be key to the feasibility of this alignment and associated construction cost and timeline.

- i. 066-331-040
- ii. 066-331-036

- iii. 068-411-002
- iv. 068-411-007
- v. 068-411-017
- vi. 068-412-001
- vii. 068-412-010
- viii. 073-100-017

The remaining segments of the proposed “west” pipeline appears to fall within street right of ways. If that changes (or if the alternate Embarcadero alignment does not have similar characteristics), we recommend obtaining preliminary title report for any other parcels affected by an alignment change. Eight PTRs at an assumed cost of \$750/PTR are included in this scope of services and fee.

2. Plat and Legal Description(s)

Praxis Consolidated International, Inc. will use proposed right of way from design team to calculate permanent and temporary easements. Prepare proposed right of way and appraisal maps. Coordinate with City during appraisal and acquisition process. Prepare legal descriptions and plats for each negotiated permanent and temporary easement or acquisition. ENGINEER has included preparation of up to nine legal descriptions with map exhibits.

Task 3 Deliverables:

- ✓ PTRs (scanned electronic copies)
- ✓ Plat and Legal Description (PDF electronic copies of Draft, 1 hard copy of FINAL signed and wet stamped and PDF electronic copy)

#### Task 4: Survey, Geotechnical Investigation, and Potholing

WWE teaming partners will provide the requested field studies in support of preliminary and final design.

1. Topographical Survey and Base Mapping for Design – Praxis Consolidated International, Inc. will complete topographic mapping utilizing aerial mapping augmented by ground survey and research. The area to be mapped will be the pipeline corridor from the existing WWTP area to the “South Bay Boulevard”, as well as the selected WRF Lift Station Site. The pipeline reach will include a strip approximately between edges of existing right of way (from property boundary, fence or other inaccessible or immovable feature to similar limit on alternate side) along the proposed route.

A. Aerial Mapping

Services will be executed using softcopy digital stereo plotters. The mapping scale will be 1”=40’ with 1’ CI. This job will consist of approx. 2.97 miles 150’ wide and developed in an AutoCAD (.dwg) format. (Note that while mapping scale will be 1”=40’, pipeline plan and profile design sheets will be produced at a more refined scale, likely 1”=20’, to promote ease of viewing existing utilities and proposed improvements in tight utility corridors along the pipe alignment.)

B. Ground Survey

Services will include development of a control network survey that will serve as the basis of mapping surveys and future construction layout and as-built surveys. Notification of affected landowners and arrange access for ground survey. Set ground control and coordinate with aerial mapping subconsultant. Perform supplemental field surveys to obtain additional detail as directed by WWE. Work will include “dipping” of storm drainage and culverts crossing of roads to obtain inverts.

C. Existing Utility Research and Subsurface Utility Engineering

Services will include coordination with existing utility providers to obtain mapping necessary to display these utilities on base mapping. ENGINEER team will request record drawings and schematics from City, utilities, locate paint markings by City and other utilities if available, request record drawings and schematics from Caltrans, SLO County, and other identified utility providers near the project work. ENGINEER team will identify utility providers in the project area and prepare utility information request letters on City letterhead. Follow up and organize maps and atlases received and post for use by the project team. Perform field survey of visible surface utility features, including cover, paint, patches and signs. Open sewer and storm manholes and inlets to measure invert depths. Compute alignments of subsurface utilities from record maps and atlases. Subsurface alignments will be

oriented and adjusted to the topographic mapping using the surveyed locations of surface features where possible. (Quality Level C&D) Consultant team will perform field survey as deemed necessary by ENGINEER after utility location consultant uses underground locating techniques, or performs air vacuum potholing. Adjust subsurface mapping with information. (Quality Level B & A)

D. Right of Way Mapping

Services will include research record maps, right of way maps, and recorded deeds. Perform field survey to search for existing monuments and obtain measurements. Analyze measurements, maps and found monuments, and determine location of existing public street right of way and parcel lines along pipeline route and lift station site. ENGINEER team will prepare Record of Survey map to document land net and right of way survey as required by PLS Act. These services will be provided in two phases. Phase 1 will include initial records research and mapping analysis in support of pipeline alignment feasibility assessment. Phase 2 will include record deed research and Record of Survey map to document land net and right of way survey in support of Design Concept Report and Final Desing of selected alignment.

E. Biological & Cultural Resource Mapping

ENGINEER team will add existing and readily available biological and cultural resource features (provided in AutoCAD compatible electronic format) from EIR consultants to project mapping as deemed necessary by ENGINEER and City. An allowance has been included in the scope of services and fee under Task 7 specific to additional mapping and work related to environmental requirements that may be requested by City. See Task 7 for additional details.

2. Geotechnical Investigation – Yeh and Associates, Inc will perform a program of data review, field exploration, laboratory testing and engineering analysis and prepare a Preliminary Geotechnical Report and a Geotechnical Report for the design of the new lift station and pipelines. Services will be provided in two phases. Phase 1 - Preliminary Geotechnical Services to support lift station site selection and preferred pipeline route, and Phase 2 - Design Geotechnical Services for design of preferred improvements.

A. Phase 1 - Preliminary Geotechnical Services

- i. Initiation and Review Existing Data. Consult with the design team and City to coordinate project initiation, collect project information and existing geotechnical data available from the site, and to request a map showing the layout of the improvements and pipeline alignment be provided for use in planning the field exploration program. Collect available geologic and geotechnical data from published maps; reports for the existing wastewater treatment facility; Caltrans Log of Test Borings for the Highway 1 bridges over Morro Creek, the Main Street Undercrossing at Highway 1, the South Bay Boulevard Overcrossing at Highway 1; and previous geotechnical studies prepared for the City for public improvements along the alignment if available. Update and submit a Field Exploration Plan for the project showing the locations of planned field explorations and phasing of exploration.
- ii. Coordination, Health and Safety, and Permits. Coordinate the locations of field exploration with the design team and City relative to access and existing buried utilities or structures. Mark the locations along the alignment and contact Underground Services Alert (USA) to notify utility companies. Prepare a health and safety plan for the field work to be performed by Yeh. Procure an encroachment permit from the City of Morro Bay for work in city streets. Coordinate field exploration with the subcontractors and procure well permits from the County of San Luis Obispo for qualifying borings.
  - a. Borings for the Highway 1 pipeline crossing will be drilled outside of the Caltrans right-of-way and no encroachment permit with that agency will be required. We assume that if any environmental studies, reports or monitors are required for this work that those will be provided by others. Yeh will not be responsible for locating utilities or buried structures or damages resulting from encountering unmarked or improperly marked utilities for the project.
- iii. Field Exploration Program. Yeh will provide a 3-day drilling program to explore the subsurface conditions at the lift station site, Morro Creek Crossing, Quintana Road/Morro Bay Boulevard

Crossing, and Highway 1 Crossing. During this period, we expect to drill one (1) boring for the lift station and three (3) borings (one each) at the trenchless crossings to depths of 40 to 60 feet. Traffic control will be provided by a subcontractor (Associated Traffic Safety of Atascadero, California) and will consist of lane closures with flagging for boring locations. The multi-use path should be closed during drilling operations because of the restricted width of the path relative to the rig.

- a. Drilling will be subcontracted to S/G Drilling Company of Lompoc, California. The borings for the pipeline and lift station will be drilled using hollow-stem augers and supplemented with drilling mud when needed. Borings will typically be sampled at 5-foot intervals by driving 2-inch or 3-inch split spoon samplers using Standard Penetration Test protocols or by pushing thin-walled (Shelby) tubes. The types and depths of the samples may be varied depending on subsurface conditions. Bulk samples will be collected from auger flights during drilling. Pavement sections will be measured and documented where borings are drilled in pavement. Excess spoils and drill fluid from the drilling will be drummed and Yeh will arrange for disposal of drummed material as needed. The cost for required testing and disposal of drums has been included.
  - b. Borings for the preliminary phase of work will be completed as standpipe piezometers (2-inch diameter PVC) equipped with flush mount or elevated locking well-heads as needed. Yeh will obtain field measurements of groundwater depths in the piezometers using a hand-held well-sounder on a monthly basis for 12 months. Data will be presented as updated in monthly memorandums and in the design Geotechnical Report.
  - c. Perform laboratory tests on selected samples collected from the drilling. Tests for classification, strength, corrosion, consolidation, and compaction will be performed on selected samples recovered from the borings. The types and numbers of tests will be selected based on the results of the field exploration program.
- iv. Geotechnical Constraints Report. Yeh will prepare a Preliminary Geotechnical Report (Geotechnical Constraints Report / Desktop Study) for the design of the project. The report will describe the project understanding, existing site conditions, work performed, and subsurface conditions encountered. The report will include the data collected during the field and laboratory test program including boring logs, laboratory test results, and graphics showing the boring locations. The report will be prepared and issued in portable document file (PDF) format to the City and design team. The report will provide conclusions and recommendations regarding:
- a. Geologic setting;
  - b. Soil and groundwater conditions encountered;
  - c. Potential for the pipeline alignment to be impacted by geologic hazards such as from seismic shaking, faulting, liquefaction, coastal flooding or tsunamis, or landsliding based on review of published data and the work performed;
  - d. Subsurface conditions and suitability of using jack and bore, HDD, or microtunneling to complete the installation;
  - e. Ground conditions relative to groundwater, hard rock, presence of cobbles or boulders, heading stability, caving or running ground;
  - f. Preliminary gassy estimation per tunneling guidelines;
  - g. Results of preliminary seismic hazard analyses;
  - h. Estimated liquefaction potential and seismic settlement based on the results of the field exploration program and the need to include any special geotechnical considerations or mitigation in the design of the project;
  - i. Suitable foundation type(s) for the subsurface conditions encountered; and
  - j. Construction considerations regarding excavation characteristics of soil encountered, temporary slopes and shoring, and construction dewatering.
- B. Phase 2 – Design Geotechnical Services

Once the final LS site layout and preferred pipeline route for the project has been determined, Yeh will prepare a design-level Geotechnical Report for the design of the project. The scope of the design-level work should be reviewed at that time to evaluate if the scope of the proposed geotechnical services is sufficient to address the proposed improvements, any special mitigations that should be included in the project based on the results of the preliminary study, or changes that may occur to the project.

- i. Initiation and Review Existing Data. Consult with the design team and City to update project alignment and design. Update and submit a Field Exploration Plan for the project showing the locations of planned field explorations for Phase II.
- ii. Coordination, Health and Safety, and Permits. Coordinate the locations of field exploration with the design team and City relative to access and existing buried utilities or structures. Mark the locations along the alignment and contact Underground Services Alert (USA) to notify utility companies. Prepare a health and safety plan for the field work to be performed by Yeh. Procure an encroachment permit from the City of Morro Bay for work in city streets. Coordinate field exploration with the subcontractors and procure well permits from the County of San Luis Obispo for qualifying borings.
  - a. We assume that if any environmental studies, reports or monitors are required for this work that those will be provided by others. Yeh will not be responsible for locating utilities or buried structures or damages resulting from encountering unmarked or improperly marked utilities for the project.
- iii. Field Exploration Program. Yeh will provide a 3-day drilling program to explore the subsurface conditions along pipeline alignment not investigated in Phase I. The field exploration program will consist of drilling and sampling at no more than approximately 1,500-foot intervals along the pipeline alignment. During this period, we expect to drill twelve (12) borings along the offsite pipeline route to depths ranging from 20 to 40 feet. Traffic control will be provided by a subcontractor (Associated Traffic Safety of Atascadero, California) and will consist of lane closures with flagging for boring locations along Main Street, Quintana Road and on Atascadero Road. The multi-use path should be closed during drilling operations because of the restricted width of the path relative to the rig.
  - a. Drilling will be subcontracted to S/G Drilling Company of Lompoc, California. The borings for the pipeline will be drilled using hollow-stem augers and supplemented with drilling mud when needed. Borings will typically be sampled at 5-foot intervals by driving 2-inch or 3-inch split spoon samplers using Standard Penetration Test protocols or by pushing thin-walled (Shelby) tubes. The types and depths of the samples may be varied depending on subsurface conditions. Bulk samples will be collected from auger flights during drilling. Pavement sections will be measured and documented where borings are drilled in pavement. Coring of boring locations will also be provided for borings on Quintana Road south of the intersection of Morro Bay Boulevard where concrete is known to be under the asphalt concrete pavement. Borings will be backfilled with bentonite cement grout, cement slurry and/or approved native fill in accordance with permit requirements. Borings drilled in roadway areas will be capped with rapid setting quickcrete. Excess spoils and drill fluid from the drilling will be drummed and Yeh will arrange for disposal of drummed material as needed. The cost for required testing and disposal of drums has been included.
  - b. Perform laboratory tests on selected samples collected from the drilling. Tests for classification, strength, corrosion, consolidation, and compaction will be performed on selected samples recovered from the borings. The types and numbers of tests will be selected based on the results of the field exploration program.
- iv. Evaluation and Draft – Geotechnical Report. Yeh will prepare a Geotechnical Report for the design of the project. The report will describe the project understanding, existing site conditions,

work performed, and subsurface conditions encountered. The report will include findings presented in the Preliminary Geotechnical Report, the data collected during the field and laboratory test program in both phases of work including boring logs, laboratory test results, and graphics showing the boring locations. Interpreted subsurface profiles will be prepared summarizing boring information along the pipeline route and at the trenchless installations. A draft of the report will be prepared and issued in portable document file (PDF) format for review by the City and design team. The report will provide conclusions and recommendations regarding:

- a. Geologic setting;
  - b. Soil and groundwater conditions encountered;
  - c. Groundwater elevations from standpipe piezometers;
- The design of the new pipelines:
- a. Foundation support for the pipe and subexcavation of the trench bottom, if needed;
  - b. Material and compaction requirements for bedding, pipe zone and trench backfill;
  - c. Suitability of the materials encountered in the borings for reuse as fill or backfill material;
  - d. Pipe buoyancy considerations relative to groundwater, flooding and liquefaction, if needed;
  - e. Typical trench detail for use with City standards;
  - f. Existing pavement thicknesses encountered and pavement structural section(s) for trench patching;
  - g. Backfill loading on underground conduits;
  - h. Soil moduli ( $E'$ ) for estimating pipe deflection;
  - i. Passive resistance,  $K_0$  and pipe-backfill friction to resist thrust along the pipe and for sizing thrust blocks, if needed;
  - j. Corrosion test data; and
  - k. Construction considerations regarding excavation characteristics of soil and rock encountered, temporary excavations, shoring requirements, and groundwater.

The design of trenchless pipe installations at Morro Creek, Quintana Road/Morro Bay Boulevard Roundabout, and Highway 1:

- Subsurface conditions and suitability of using jack and bore, HDD, or microtunneling to complete the installation;
- Ground conditions relative to groundwater, hard rock, presence of cobbles or boulder, heading stability, caving or running ground;
- Preliminary gassy estimation per tunneling guidelines;
- Jacking or thrust resistance for launching the pipe;
- Monitoring requirements for settlement or heave; and
- Frac-out potential and response planning.

Recommendations for design of the lift station and control building:

- Seismic data for use with the California Building Code;
- Mitigation of liquefaction using seismic settlement considerations, deepened foundations, pile support, or compaction grouting, if needed;
- Grading and site preparation for surface structures (generator pad, odor control pad, and control building);
- Stabilization and foundation preparation for the lift station considering depth of excavation, groundwater and subgrade conditions encountered;
- Material and compaction requirements for backfill around the lift station;
- Resistance to buoyancy forces associated with groundwater or flooding;
- Shallow foundation design (allowable bearing resistance, estimated total and differential settlements considering static and seismic loads, and minimum footing embedment and widths);

- Mat foundation design (allowable bearing resistance and subgrade modulus (spring constant) from settlement analyses);
  - Expansive soil considerations;
  - Resistance to lateral loads from friction and passive resistance;
  - Lateral earth pressures for buried structures;
  - Downdrag due to seismic settlement on buried structures, if needed;
  - Construction considerations regarding excavation characteristics of soil encountered, temporary slopes and shoring, and construction dewatering.
- v. Final - Geotechnical Report. Prepare and issue the final Geotechnical Report incorporating comments and input from the design team. This scope of work assumes that the final report will not involve addressing new alignments, changes in the project or additional field exploration. One PDF and one (1) hard copy of the final report will be submitted unless otherwise requested.
- vi. Plan and Specification Review. Provide consultation and review project plans and specifications to confirm the geotechnical recommendations have been incorporated into the construction documents. Provide comments via email or memorandum, and review the revised plans to confirm the comments have been addressed. Issue a letter confirming that the construction plans have been prepared in general accordance with the Geotechnical Report.
3. Potholing - Based on previously completed tasks, ENGINEER will identify select utility locations where the proposed pipe improvements are near one another and more precise utility location data is required to avoid or mitigate conflict. ENGINEER will communicate these locations to CLIENT and confirm that expenditure of funds to locate utility is consistent with Client's desire to mitigate utility conflict risk on this project. Water Works utility potholing subconsultant, EXARO Technologies Corporation or other local utility locating firm as deemed appropriate by ENGINEER at time of work, will complete vacuum excavation to confirm underground utility location and depth. For budgeting purposes, our team has included three (3) days of vacuum excavation in the budget, where typical production is 4-8 pothole locations per day.

#### Task 4 Deliverables:

- ✓ Survey (AutoCAD electronic files incorporated into and delivered with FINAL Design)
- ✓ Geotechnical Report(s) (PDF electronic copies of Draft, 1 hard copy of FINAL signed and wet stamped and PDF electronic copy)

### Task 5: Concept Design Report

The resulting information gathered from the workshops, field investigations and office analysis will be used as the basis for the Concept Design Report, which shall include, at a minimum, the following:

1. Description of existing facilities, proposed new facility alternatives and the selected improvements;
  - a. Lift Station Site Alternatives and Selection Summary, including copies and/or reference to pertinent Task 2 workshop materials, meeting notes and decision logs.
  - b. Pipeline Route Study and Preferred Alignment Selection Summary, including copies and/or reference to pertinent Task 2 workshop materials, meeting notes and decision logs.
2. Design criteria;
3. Hydraulic analysis and pump schematic;
4. Electrical, controls, instrumentation, SCADA, HVAC, and power supply / backup power details;
5. Flood protection
6. Pipeline leak detection
7. Site layout considerations including vector truck access
8. Construction sequencing plan;
9. Schedule;

10. Cost opinion (with design and construction contingencies)
11. Major equipment cut sheets and catalog cuts; and
12. Summary of all field investigations (including survey, Geotech and potholing).

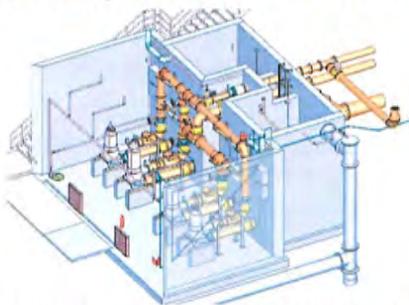

**Task 5 Deliverables:**

- ✓ WRF Lift Station and Offsite Pipelines Concept Design Report (15 hard copies, Draft and Final, 1 hard copy of FINAL signed and wet stamped and PDF electronic copy)

**Task 6: Construction Documents and Specifications**

WWE will prepare contract documents (improvement plans, technical specifications and cost estimates) in three submittals: 60%, 90% and 100% (Final Bid Documents). The Concept Design Report will serve as the foundation for detailed design and the effort put into producing a very high quality and detailed preliminary design will pay off exponentially in detailed design execution. Prior to each submittal, the work product will be reviewed and revised through Water Works QA/QC process. Submittal of the 60% and 90% review documents will occur at Project Review Workshops with the entire project team. The submittal will be presented to City staff to familiarize the group with the information submitted and the design thought process behind the work. Following the Project Review Workshop, City staff will have a 2-week review period to provide any additional comments which were not brought forward in the Project Review Workshop. In our experience, this kind of active review of submittal documents more fully engages the entire project team in the design process.

**60% Improvement Plans and Technical Specifications**

3-Dimensional CADD Modeling - WWE will perform all detailed design using 3-dimensional CADD tools. This is our standard practice and leads to better coordination, integrated cross-checking and clearer contract documents. The 3-dimensional CADD models also function as an invaluable communications tool, especially at the 60% design stage. At this stage, all the facilities will be completely modeled. Water Works Engineers design staff will present the model to City staff so that staff can more easily and thoroughly visualize how the finished facilities will look and function. This approach to the 60% submittal allows for a clearer understanding of facility

geometry, access and clearance issues, and overall system functionality. The 3-dimensional design model is provided in addition to the standard drawings and specifications for the 60% deliverable (the 3-dimensional design model is used to create the plans and sections presented in the 60% design drawings).

**90% Improvement Plans and Technical Specifications**

In general, the 90% design submittal will be a complete project package, with all design drawings, details and specifications completed. The period between 90% and 100% will solely be dedicated to minor inter-disciplinary coordination and final QA/QC checking of all documents. In the 90% submittal, we incorporate both 2-dimensional plan and section drawings with 3-dimensional isometrics to clearly show how complex piping systems are to be constructed. This provides for clear drawings and reduced risk on the bidding contractors' part. The 90% design will be reviewed the City and each review comment that was received during the design process and how it was addressed will be discussed to ensure that all comments have been recognized and addressed. Updated cost opinion will be provided.

**100% Design and Bid Documents**

The 100% Bid-Ready Design Documents Submittal incorporates comments provided by the CLIENT at the 90% design stage and/or QA/QC comments generated by WWE's QA/QC review team. The result is clear, complete, cross-checked bid-ready design documents. The City will complete one final review of the 100% set to confirm compliance with all permitting and other final coordination items, and ENGINEER will make minimal final revisions and produce a Final set of Bid Documents.

The following is a preliminary technical specification list and sheet count for the anticipated improvements.

**Technical Specifications:**

SUMMARY OF WORK  
SPECIAL PROJECT CONSTRAINTS

**Standard Details (8 sheets)**

Water Works standard details can be provided within the Plans or Technical Specifications as directed by City. It has been our experience that City Building Department Reviewers prefer that the standard details are included within the Plans, so we have made that assumption for this scope of services.

Task 6 Deliverables shall include:

- ✓ 60% Design Submittal (PDF)
- ✓ 90% Design Submittal (PDF)
- ✓ 100% Design Submittal (PDF)
- ✓ Bid Documents (PDF and source files)
- ✓ Final cost opinion

## Task 7: Permitting Support

Water Works team shall be available to provide support for permitting efforts related to the WRF Lift Station and Offsite Pipeline Project. Work shall be completed on an as-needed / on-call basis as directed by the City or the WRF Program Manager (as approved by the City). ENGINEER will provide technical information, exhibits and other requested items as part of the Permitting Support allowance budget.

Also included under this task as part of the Permitting Support allowance budget and as requested in Addendum 2, Water Works subconsultant, Praxis, will shall be available on an as-needed basis to complete mapping of biological and cultural resources depicted by the City's environmental consultant.

Also included under this task as part of the Permitting Support allowance budget, Water Works shall be available to provide support for Planning Commissions review and approval efforts related to the WRF Lift Station and Offsite Pipeline Project. Participation in two (2) Planning Commission Meeting(s) is included as part of Task 1: Project Management under Presentation to Public Entities. However, it is anticipated that additional services shall be completed on an as-needed / on-call basis as directed by the City or the WRF Program Manager (as approved by the City) to support efforts related to Planning Commission approval outside of these meetings. ENGINEER will provide coordination, technical information, exhibits and other requested items to support these activities.

## Task 8: Engineering and Services during Construction

ENGINEER will provide the following Engineering Services During Construction for the project. This assumes an 18-month concurrent construction schedule for both Lift Station and Forcemain construction.

### *Bid Period Assistance*

WWE will provide bid period assistance for the Lift Station and Offsite Pipelines as follows:

1. Participate in Pre-bid Conferences and preparation (assume 1 meeting) – to be led by PM team
2. Provide responses to contractor inquiries during bid advertisement for City use (assume qty. 4)
3. Prepare addenda as required for City use (assume qty. 2)
4. Review bids received with City

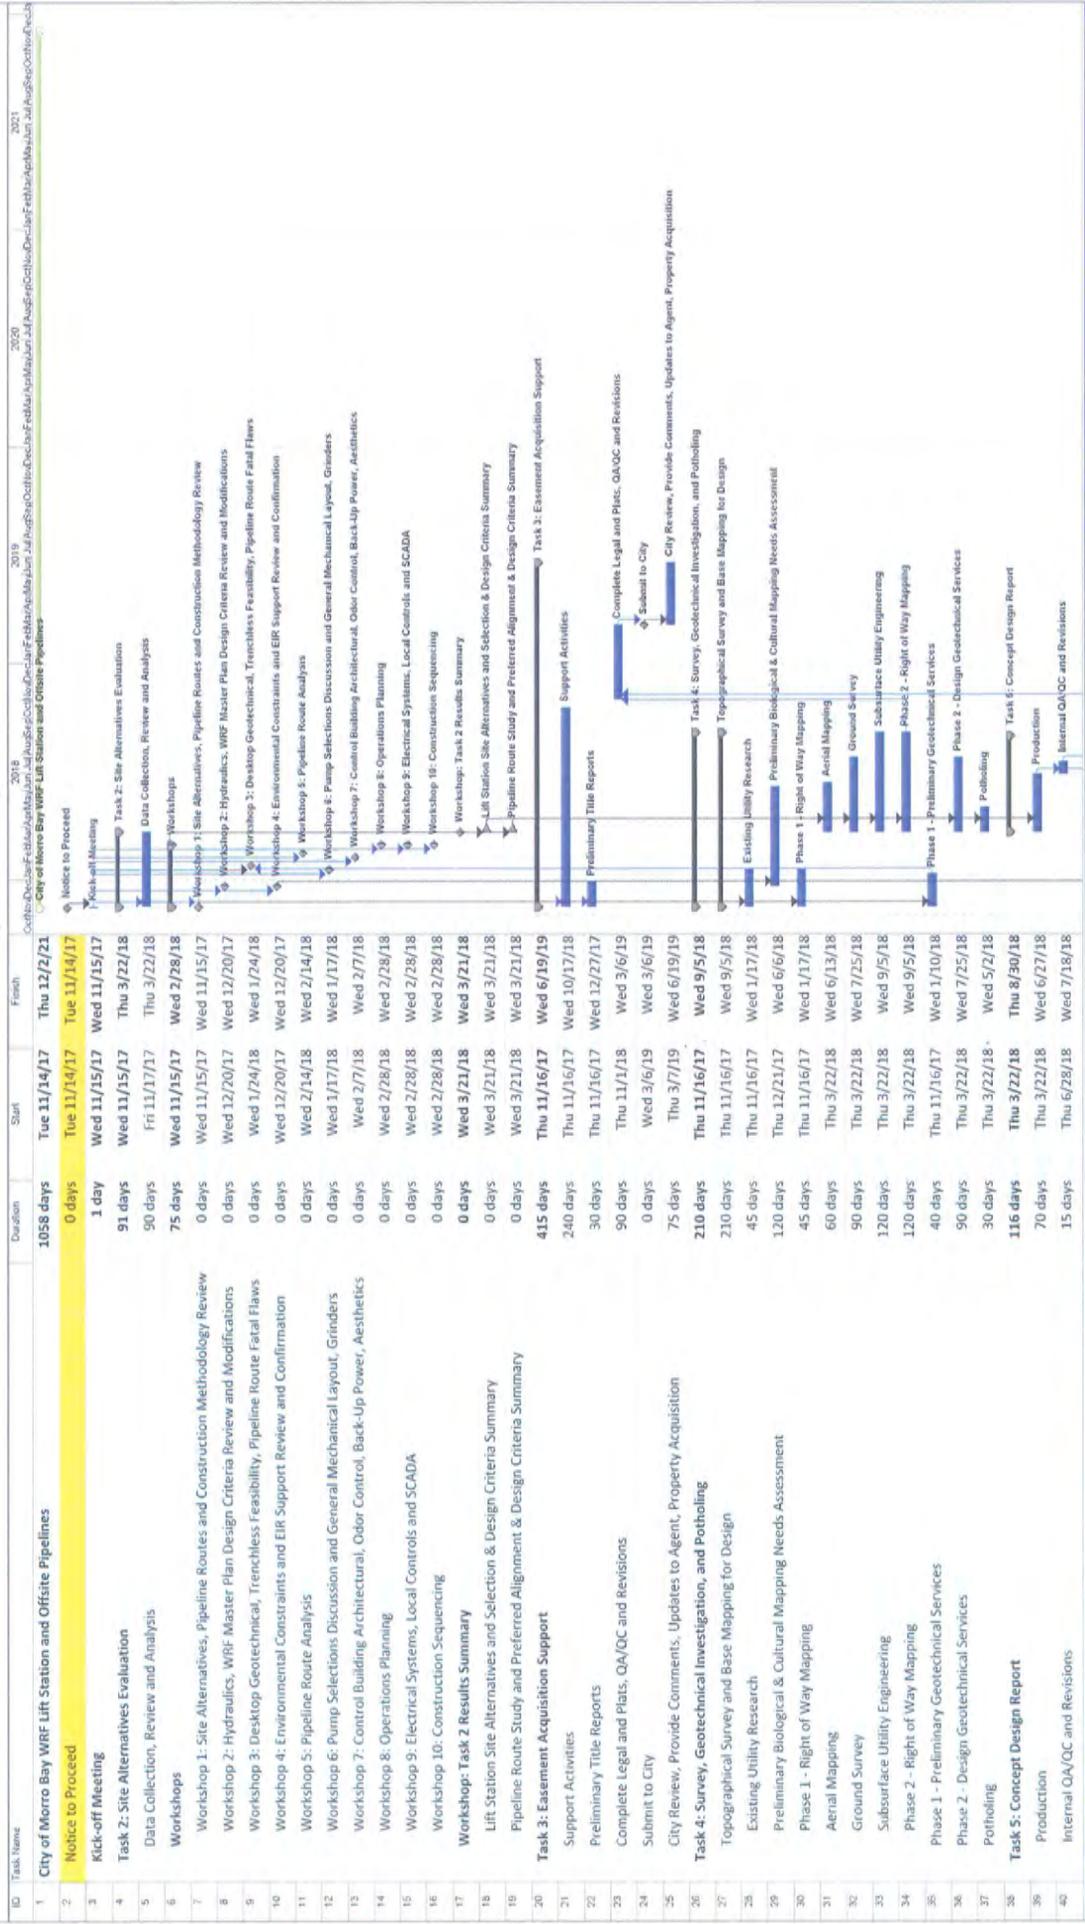

### *Construction Phase Assistance*

1. Pre-Construction Conference Attendance (assume 1 meeting)
2. It is understood that the City intends to use Procore as the construction management software for tracking and documentation of RFIs, submittals, etc. Procore software platform will be provided and maintained by the City and PM team. ENGINEER will be responsible for inputting responses via this software platform.
3. Complete all submittal reviews (assume qty. 80)
4. Request for Information (RFI) and Request for Clarification (RFC) review, documentation and tracking (assume qty. 30)
  - a.
5. Change Order Request review, documentation and tracking (assume qty, 6)
6. Attend Weekly Jobsite Meetings (assume 12 months at 2x per month = qty. 24)
7. Assist in observing operational test of lift station (assume 3 site visits, one each for planning, initial, and final operational test)
8. Final Inspection, Report and Project Completion Recommendation Letter (assume 3 site visits, one each for development, progress review, and final punch list acceptance)
9. Record Drawings (assume redlines provided from Contractor and City Inspector, assume 80 hours for pump station and 40 hours for pipelines)

The following additional post-construction services could be provided by WWE should the City request additional services:

1. Arc-Flash and Device Coordination Study (per NFPA 70E and IEEE 1584)
2. O&M Manual Preparation

## PROPOSED COMPENSATION

Water Works Engineers proposes to complete the services described herein on a Time and Expense basis not to exceed \$1,353,574 without written consent from CLIENT and invoiced in accordance with our Hourly Billing Rates table below.

The total budget for each task will be as follows:

| Subtask | Title                                                     | Budget*            |
|---------|-----------------------------------------------------------|--------------------|
| 1       | Task 1: Project Management                                | \$64,090           |
| 2       | Task 2: Site Alternatives Evaluation                      | \$106,236          |
| 3       | Task 3: Easement Acquisition Support (Allowance)          | \$34,090           |
| 4       | Task 4: Survey, Geotechnical Investigation, and Potholing | \$254,423          |
| 5       | Task 5: Concept Design Report                             | \$159,806          |
| 6       | Task 6: Construction Documents and Specifications         | \$506,749          |
| 7       | Task 7: Permitting Support (Allowance)                    | \$45,500           |
| 8       | Task 8: Engineering and Services during Construction      | \$182,680          |
|         | <b>Total Budget</b>                                       | <b>\$1,353,574</b> |

\*A detailed fee basis work plan is provided on the following page for reference.

| Classification | Title                             | Hourly Rate |
|----------------|-----------------------------------|-------------|
| AA             | Administrative                    | \$96        |
| E1             | Staff Engineer                    | \$119       |
| E2             | Associate Engineer                | \$146       |
| E3             | Project / Structural Engineer     | \$165       |
| E4             | Senior Project Engineer / Manager | \$191       |
| E5             | Principal Engineer                | \$221       |
| I1             | Field Inspector                   | \$129       |
| I2             | Senior Inspector                  | \$144       |
| I3             | Supervising Inspector             | \$160       |
| T1             | CADD Tech 1                       | \$81        |
| T2             | CADD Tech 2                       | \$109       |
| T3             | CADD Tech 3                       | \$133       |

**Notes:**

1. A markup of 10% will be applied to all project related Direct Costs and Expenses.
2. An additional premium of 25% will be added to the above rates for Expert Witness and Testimony Services.
3. Rate effective through December 31, 2017. A 3% increase will be added for any services performed in each year thereafter.

## Exhibit B

### INSURANCE REQUIREMENTS

*Prior to the beginning of and throughout the duration of the Agreement, Consultant will maintain insurance in conformance with the requirements set forth below. Consultant will use existing coverage to comply with these requirements. If that existing coverage does not meet the requirements set forth here, Consultant agrees to amend, supplement or endorse the existing coverage to do so. Consultant acknowledges that the insurance coverage and policy limits set forth in this section constitute the minimum amount of coverage required. Any insurance proceeds available to City in excess of the limits and coverage required in this agreement and which is applicable to a given loss, will be available to City.*

*Consultant shall provide the following types and amounts of insurance:*

Commercial General Liability Insurance using Insurance Services Office "Commercial General Liability" policy from CG 00 01 or the exact equivalent. Defense costs must be paid in addition to limits. There shall be no cross liability exclusion for claims or suits by one insured against another. Limits are subject to review but in no event less than \$1,000,000 per occurrence.

Business Auto Coverage on ISO Business Auto Coverage from CA 00 01 including symbol 1 (Any Auto) or the exact equivalent. Limits are subject to review, but in no event to be less than \$1,000,000 per accident. If Consultant owns no vehicles, this requirement may be satisfied by a non-owned auto endorsement to the general liability policy described above. If Consultant or Consultant's employees will use personal autos in any way to perform the Scope of Services, then Consultant shall provide evidence of personal auto liability coverage for each such person.

Property Damage Insurance in an amount of not less than \$1,000,000 for damage to the property of each person on account of any one occurrence.

Workers Compensation on a state-approved policy form providing statutory benefits as required by law with employer's liability limits.

Excess or Umbrella Liability Insurance (Over Primary) if used to meet limit requirements, shall provide coverage at least as broad as specified for the underlying coverages. Any such coverage provided under an umbrella liability policy shall include a drop down provision providing primary coverage above a maximum \$25,000 self-insured retention for liability not covered by primary but covered by the umbrella. Coverage shall be provided on a "pay on behalf" basis, with defense costs payable in addition to policy limits. Policy shall contain a provision obligating insurer at the time insured's liability is determined, not requiring actual payment by the insured first. There shall be no cross liability exclusion precluding coverage for claims or suits by one insured against another. Coverage shall be applicable to City for injury to employees of Consultant, subContractors or others involved in the Work. The scope of coverage provided is subject to approval of City following receipt of proof of insurance as required herein. Limits are subject to review but in no event less than \$1,000,000 per occurrence.

Professional Liability or Errors and Omissions Insurance as appropriate shall be written on a policy

form coverage specifically designated to protect against acts, errors or omissions of the Consultant and "Covered Professional Services" as designated in the policy must specifically include work performed under this agreement. The policy limit shall be no less than \$2,000,000 per claim and in the aggregate. The policy must "pay on behalf of" the insured and must include a provision establishing the insurer's duty to defend. The policy retroactive date shall be on or before the effective date of this agreement.

*Insurance procured pursuant to these requirements shall be written by insurer that are admitted carriers in the state California and with an A.M. Best's rating of A- or better and a minimum financial size VII.*

General conditions pertaining to provision of insurance coverage by Consultant. Consultant and City agree to the following with respect to insurance provided by Consultant:

1. Consultant agrees to have its insurer endorse the third party general liability coverage required herein to include as additional insureds the City of Morro Bay and its officials, employees and agents, using standard ISO endorsement No. CG 2010 with an edition prior to 1992. Consultant also agrees to require all Consultants, and sub-Contractors to do likewise.
2. No liability insurance coverage provided to comply with this Agreement shall prohibit Consultant, or Consultant's employees, or agents, from waiving the right of subrogation prior to a loss. Consultant agrees to waive subrogation rights against City regardless of the applicability of any insurance proceeds, and to require all Consultants and sub-Contractors to do likewise.
3. All insurance coverage and limits provided by Consultant and available or applicable to this agreement are intended to apply to the full extent of the policies. Nothing contained in this Agreement or any other agreement relating to the City or its operations limits the application of such insurance coverage.
4. None of the coverages required herein will be in compliance with these requirements if they include any limiting endorsement of any kind that has not been first submitted to City and approved of in writing.
5. No liability policy shall contain any provision or definition that would serve to eliminate so-called "third party action over" claims, including any exclusion for bodily injury to an employee of the insured or of any Consultant or subcontractor.
6. All coverage types and limits required are subject to approval, modification and additional requirements by the City, as the need arises. Consultant shall not make any reductions in scope of coverage (e.g. elimination of contractual liability or reduction of discovery period) that may affect City's protection without City's prior written consent.
7. Proof of compliance with these insurance requirements, consisting of certificates of insurance evidencing all of the coverages required and an additional insured endorsement to

Consultant's general liability policy, shall be delivered to City at or prior to the execution of this Agreement. In the event such proof of any insurance is not delivered as required, or in the event such insurance is canceled at any time and no replacement coverage is provided, City has the right, but not the duty, to obtain any insurance it deems necessary to protect its interests under this or any other agreement and to pay the premium. Any premium so paid by City shall be charged to and promptly paid by Consultant or deducted from sums due Consultant, at City's option.

8. It is acknowledged by the parties of this agreement that all insurance coverage required to be provided by Consultant or any sub-Contractor, is intended to apply first and on a primary, noncontributing basis in relation to any other insurance or self-insurance available to City.
9. Consultant agrees to ensure that subcontractors, and any other party involved with the Scope of Services who is brought onto or involved in the Scope of Services by Consultant, provide the same minimum insurance coverage required of Consultant. Consultant agrees to monitor and review all such coverage and assumes all responsibility for ensuring that such coverage is provided in conformity with the requirements of this section. Consultant agrees that upon request, all agreements with subcontractors and others engaged in the Scope of Services will be submitted to City for review.
10. Consultant agrees not to self-insure or to use any self-insured retentions or deductibles on any portion of the insurance required herein and further agrees that it will not allow any Consultant, subContractor, Architect, Engineer or other entity or person in any way involved in the performance of the Scope of Services to self-insure its obligations to City. If Consultant's existing coverage includes a deductible or self-insured retention, the deductible or self-insured retention must be declared to the City. At the time the City shall review options with the Consultant, which may include reduction or elimination of the deductible or self-insured retention, substitution of other coverage, or other solutions.
11. The City reserves the right at any time during the term of the contract to change the amounts and types of insurance required by giving the Consultant ninety (90) days advance written notice of such change. If such change results in substantial additional cost to the Consultant, the City will negotiate additional compensation proportional to the increase benefit to City.
12. For purposes of applying insurance coverage only, this Agreement will be deemed to have been executed immediately upon any party hereto taking any steps that can be deemed to be in furtherance of or towards performance of this Agreement.
13. Consultant acknowledges and agrees that any actual or alleged failure on the part of City to inform Consultant of non-compliance with any insurance requirements in no way imposes any additional obligations on City nor does it waive any rights hereunder in this or any other regard.
14. Consultant will renew the required coverage annually as long as City, or its employees or agents face an exposure from operations of any type pursuant to this agreement. This obligation applies whether or not the agreement is canceled or terminated for any reason.

Termination of this obligation is not effective until City executes a written statement to that effect.

15. Consultant shall provide proof that policies of insurance required herein expiring during the term of this Agreement have been renewed or replaced with other policies providing at least the same coverage. Proof that such coverage has been ordered shall be submitted prior to expiration. A coverage binder or letter from Consultant's insurance agent to this effect is acceptable. A certificate of insurance and/or additional insured endorsement as required in these specifications applicable to the renewing or new coverage must be provided to City within five days of the expiration of the coverages.
16. The provisions of any workers' compensation or similar act will not limit the obligations of Consultant under this agreement. Consultant expressly agrees not to use any statutory immunity defenses under such laws with respect to City, its employees, officials and agents.
17. Requirements of specific coverage features or limits contained in this section are not intended as limitations on coverage, limits or other requirements nor as a waiver of any coverage normally provided by any given policy. Specific reference to a given coverage feature is for purposes of clarification only as it pertains to a given issue, and is not intended by any party or insured to be limiting or all-inclusive.
18. These insurance requirements are intended to be separate and distinct from any other provision in this agreement and are intended by the parties here to be interpreted as such.
19. The requirements in this Section supersede all other sections and provisions of this Agreement to the extent that any other section or provision conflicts with or impairs the provisions of this Section.
20. Consultant agrees to be responsible for ensuring that no contract used by any party involved in any way with the Scope of Services reserves the right to charge City or Consultant for the cost of additional insurance coverage required by this agreement. Any such provisions are to be deleted regarding City. It is not the intent of City to reimburse any third party for the cost of complying with these requirements. There shall be no recourse against City for payment of premiums or other amounts with respect thereto.
21. Consultant agrees to provide immediate notice to City of any claim or loss against Consultant arising out of the work performed under this agreement. City assumes no obligation or liability by such notice, but has the right (but not the duty) to monitor the handling of any such claim or claims if they are likely to involve City.

**Subject: Notice Requesting Proposals for Professional Services for the City of Morro Bay SCADA System Master Plan**

The City of Morro Bay (City) is requesting sealed proposals from professional controls and instrumentation service providers for the development of the City of Morro Bay SCADA System Master Plan.

All proposals must be received by the City of Morro Bay Public Works Department by 2:00 PM on Friday, December 1, 2017.

Proposals received after said time will not be considered. To guard against premature opening, each proposal shall be submitted to the City of Morro Bay Public Works Department in a sealed envelope plainly marked with the proposal title proposer's name, address, and time and date of the proposal submittal deadline.

Questions may be submitted to the City's Utilities Division Manager, Joe Mueller, via e-mail at [jmueller@morrobayca.gov](mailto:jmueller@morrobayca.gov) until November 17, 2017, at 5:00 PM. Responses and addenda will be posted to the City's website (<http://www.morro-bay.ca.us>) by November 27, 2017.

Onsite review of information related to the City's SCADA Master Plan Project will be provided at a non-mandatory Pre-Proposal Meeting to be held at 10 AM on November 10, 2017, at the Veteran's Memorial Building (209 Surf Street, Morro Bay).

## **I. INSTRUCTIONS TO PROPOSERS**

### **A. Pre-Proposal Meeting**

A non-mandatory pre-proposal meeting for this request for proposal (RFP) will be held at 10:00 AM on November 10, 2017, at the Veteran's Memorial Building, located at 209 Surf Street, Morro Bay, CA 93442.

### **B. Receipt and Opening of Proposals**

The City invites qualified firms to submit sealed proposals for professional services for the City of Morro Bay SCADA System Master Plan. Proposals will be received at the City's Public Works Department by 2:00 PM on Friday, December 1, 2017, located at:

City of Morro Bay Public Works Department  
595 Harbor Street  
Morro Bay, CA 93442

An envelope containing five (5) hard copies and one electronic copy of the proposal must be sealed and clearly labeled "Proposal for Professional Services for the City of Morro Bay SCADA Master Plan." Include the electronic copy in Adobe PDF format on a CD, DVD, or flash drive. FAX submittals will not be accepted.

### **C. Examination of Requirements**

Each proposer must carefully examine the requirements of the request for proposal (RFP). Each proposer shall meet all of the terms and conditions of the RFP. By submitting a proposal, the proposer acknowledges acceptance of all provisions of the RFP.

### **D. Communications and Availability of Staff**

All timely requests for information submitted in writing will receive a written response from the City. Any oral communication shall not be binding on the City. All requests for information must be provided in writing and directed to the City's Utilities Division Manager, Joe Mueller, via e-mail at [jmueller@morrobayca.gov](mailto:jmueller@morrobayca.gov). To be considered, all requests for information must be received by 5:00 PM on November 17, 2017. Responses and addenda will be posted to the City's website (<http://www.morro-bay.ca.us>) by November 27, 2017.

The Utilities Division Manager and City staff are available for meetings and/or site visits with each potential proposer to discuss the project. All visits will be scheduled through the Utilities Division Manager by email (above) or by phone at (916) 826-3912.

## **II. DESCRIPTION OF WORK**

### **A. Project Description**

The City of Morro Bay, CA located in San Luis Obispo County, provides water and wastewater services to a population of approximately 10,300. Currently, the City has no system-wide or standardized SCADA system for either the water or wastewater utilities. In addition to the existing wastewater treatment plant (WWTP), the City operates multiple remote sites, including:

- Four brackish water wells (Morro wells)

- Five seawater wells
- Water treatment plant with separate seawater reverse osmosis and brackish water reverse osmosis treatment systems with associated automatic control system
- Wastewater treatment plant, which is expected to be replaced by a new Water Reclamation Facility
- State Water Project turnout, Coastal Branch
- Four water storage facilities
- Two water booster stations
- Three lift stations

The WWTP and remote sites operate primarily on Allen Bradley Programmable Logic Controllers (PLCs) and Opto-22 programmable automation controllers (PACs) from variety of manufacturers. With the exception of the four water storage facilities, alarms and reporting are accomplished via telephone auto-dialers and monitored alarm service. Water storage facilities communicate to the Corporation Yard via serial radio.

It is the City's intent to develop a standardized platform of PLCs, Operator Interface Terminals (OITs), SCADA software, and telemetry for the Water and Wastewater Divisions. The City intends to upgrade the remote sites and the existing WWTP (to the extent practicable) with the new SCADA system. It is assumed that all existing telephone or serial radio communication will be replaced with Ethernet radio where feasible.

The City is currently in the planning stages of a major capital improvement project to replace the 60-year-old Morro Bay-Cayucos Wastewater Treatment Plant with a new Water Reclamation Facility (WRF). It is anticipated the project will follow a "Guaranteed Maximum Price" (GMP) design build process. The Master Plan must consider the needs of the new facility during the evaluation of alternatives, and will provide a framework for development of specifications for the SCADA facilities at the new WRF. The new WRF will feature fiber-optic and/or radio communications for remote operation. The WRF will be manned 8 hours per day, five days per week, with full remote operation at all other times.

Decisions regarding recommended SCADA system design will be made based on overall value. New technologies that can reduce labor costs and overall cost of ownership should be considered. However, investment in new control and information systems will be limited to technologies that have been demonstrated on successful installations at similar sites. In addition, technology advances and history will be considered as part of a strategy to minimize risks associated with avoiding costs related to technology obsolescence. City staff have prior positive experience with Modicon and Allen-Bradley PLCs, and iFix, WonderWare, ClearScada, and ControlLogix software packages.

The City is requesting proposals from qualified system integrators to evaluate the existing system and its use by staff and to develop a Master Plan as a guide to update the existing and future SCADA systems. The City prefers a qualified instrumentation and control systems integrator to develop the SCADA Master Plan, as opposed to an engineering firm that only performs design and specifications. The system integrator selected to prepare the SCADA Master Plan will not be

precluded from participating on the Design/Build team that is selected for the construction of the new WRF. If the integrator selected to prepare the SCADA Master Plan is not part of the design/build team, the scope of this work may be expanded to include office engineering support to the City during construction of the new WRF (e.g. submittal review, response to RFIs, etc.).

The City's high-level goals for the SCADA Master Plan include:

- An evaluation of the existing facilities and SCADA system to determine any deficiencies
- Identification of City operational requirements and information / control needs
- Confirming Radio Path performance
- Developing a Master Plan to develop standardized water and wastewater SCADA facilities, upgrades to existing SCADA components to maximize reliability, responsiveness, cost effectiveness, security, and scalability
- Providing recommendations for system-wide software and communication hardware that will be utilized at the City's new WRF (to be designed by others), in order to ensure all systems are compatible

The Consultant selected for this project will be required to provide equipment, materials, and labor to complete the Scope of Work, and to prepare interim technical memoranda as documentation of the project elements. The City will provide the selected consultant with access to staff for interviews as needed throughout the project. Technical memoranda shall be prepared as a draft for City review, followed by final revision that incorporates comments received. It is expected that the Master Plan report will be based upon the interim technical memoranda, and will outline a planned approach and schedule to implement recommended changes or upgrades. Planning level cost estimates for each modification shall be included.

Maps showing City water and wastewater infrastructure are included in Appendix B.

## **B. Scope of Work**

The objective of this Scope of Work is to provide a framework for development of a Master Plan to achieve a flexible, reliable, and comprehensive SCADA environment. The Master Plan shall include specific recommendations with budgetary cost estimates and schedule for the next five to ten years. The Scope of Work anticipates four steps to developing the Master Plan: Assess Current Environment; Identify Goals and Metrics; Perform Radio Path Survey; and Prepare SCADA Master Plan report.

All deliverables will include four (4) hardbound copies and one electronic copy (.pdf) for each element of each deliverable.

## **1. Project Meetings and Coordination**

During project, the Consultant will attend progress/coordination meetings with the City staff to discuss issues related to the project and to update the City regarding progress. Anticipated meetings, at a minimum, are as follows:

- Project kick-off meeting
- WWTP and Remote Sites Visit (Assess Current Environment)
- Goals and Metrics Development Meeting
- Draft Goals and Metrics Tech Memo Review Meeting
- Draft Master Plan Review Meeting

The Consultant shall attend as many other working meetings as needed to complete the Master Plan. The Consultant will coordinate with the City on activities including scheduling meetings, tracking activities, and reporting on work in progress.

## **2. Assess Current Environment**

The assessment will provide an inventory and detailed written and graphical descriptions of the current environment that will enable effective analysis and recommendations.

The assessment shall accomplish the following tasks:

- Review and understand the existing SCADA system currently in use
- Document how the current SCADA system is used by operations staff
- Provide recommendations regarding capabilities that should be considered based on the observed operational practices
- Review and document current SCADA system deficiencies or needed upgrades

Elements to be identified and described at each facility may include:

- Hardware (Servers, HMIs, RTUs, PCs, PLCs, printers, etc.)
- Software (iFix, WonderWare, ClearScada, Financial Edge, Maintenance Connection, Rockwell, MS Office, Alchemy, etc.)
- Networks (cell, routers/switches, SAN-layer, cables/radios, protocols, providers, Internet access)
- Databases (process control (SCADA), financial, work, inventory, location (GIS), spreadsheets, etc.)
- Functions (process control (SCADA), financial management, work management, document management, production, telecommunications, security, reporting, website, backups, etc.)

The assessment report will include graphical presentations of each component in sufficient detail to analyze performance improvement opportunities. The report will document details of each component, including:

- Hardware (brand name, model, CPU type, speed, memory, age of equipment, etc.)
- Software (application vendor, product name, version, number of users, etc.)

- Network (network diagram showing media, number of channels/pairs, and protocols, list of network equipment with brand name, model, age, etc.)
- Databases (conceptual data model showing key indices, applications, interfaces and attributes)
- Functions (brief description of the function and necessary components)

Deliverable: Draft and Final Assessment Report

### **3. Identify Goals and Metrics**

This task will develop SCADA system performance goals and metrics designed to meet the City's needs. Examples of performance goals include:

- Capital cost
- Cost for implementation
- Backup
- Resiliency
- Redundancy/disaster recovery
- Reliability
- Security
- Flexibility
- Functionality
- Hardware
- Software
- Radio systems and frequencies
- Licensing requirements (e.g. FCC, software, support, etc.)
- Support
- Expandability
- Maintenance
- Ease of use
- Integration into enterprise management systems
- Operator interface (cloud-based, local, central, etc.)

During the Goals and Metrics meeting with City staff, the Consultant shall solicit feedback from City staff on goals for the SCADA system and future system upgrades. The Consultant shall discuss options and alternatives with City staff, compile City goals and requirements, and document the Consultant's understanding, along with alternatives and recommendations to meet the identified requirements. The outcome of the Goals and Metrics Task shall provide the Consultant with sufficient information to develop the recommendations of the Master Plan.

The Consultant shall prepare a draft and final Tech Memo (TM) summarizing the understanding of City needs and goals. The TM shall include a thorough discussion of solutions to be carried forward in the Master Plan.

Deliverable: Draft and Final Goals and Metrics Technical Memorandum

#### **4. Radio Path Survey**

The existing City water storage facilities communicate to the City Corporation Yard via serial radio. It is anticipated that it will be recommended that all remote City sites (water and wastewater) be upgraded to ethernet radio communication for future improvements. Site-specific field-based radio path surveys shall be performed at all remote sites to provide the City and consultant with information necessary to recommend system hardware and remote telemetry facilities. The survey shall include “as-measured” Remote Signal Strength Indicated (RSSI) values, and “projected” RSSI values to correct for limitations in the test equipment.

The radio survey shall document, at a minimum, the following:

- Test and existing (if present) antenna type, height, location, orientation/bearing
- RSSI
- Signal/Noise ratio
- Path length
- Fade margin (dB)
- Minimum Tx rate (Mbps)
- Antenna direction (degrees)

The outcome of the survey shall provide, at a minimum, recommendations for the following:

- Proposed antenna type, height, location, orientation/bearing
- Radio frequency and licensing requirements
- Radio path
- Gain
- Antenna wind survival rating

Remote sites will communicate to the existing WWTP. The consultant shall coordinate with the City to determine feasible sites and antenna height at the existing WWTP, and maximum allowable height at remote sites. The future WWTP will be connected to the existing WWTP through fiber-optic connection.

Deliverable: Radio Path Survey Report

## **5. Master Plan Report**

Following review and incorporation of the City's comments in all previous tasks, the Consultant shall incorporate all deliverables produced, and prepare a Master Plan Report and executive summary. The executive summary will include a summary description and a Gantt chart showing all action items for a five to ten-year implementation program.

This task shall include an evaluation of a variety of systems, a ranking and discussion of recommended solutions, and shall provide a thorough discussion of final recommendations.

The Master Plan Report shall include:

- Recommendations for replacement SCADA systems
- Information developed in interim Technical Memoranda
- Recommendations that meet Department of Homeland Security (DHS) Best Management Practices (BMPs)
- Written Disaster Recovery Plan meeting DHS requirements
- Recommendations for redundancy requirements (e.g. hot standby for primary PLCs)
- Recommendations that all packaged control systems utilize standardized PLCs recommended for all City facilities
- Recommendations for Factory Performance Testing (FAT) requirements during construction
- Cost estimates for implementation
- Ongoing system maintenance requirements (e.g. staffing needs, licensing, associated cost estimates)
- Estimated system life cycle and strategies to maximize the system life
- Telemetry system block diagrams showing existing and recommended systems
- Remote site instrumentation and PLC I/O lists
- PLC-Based Master Telemetry Unit (Location to be determined by Radio Site Survey)
- Radio Repeater (if required)
- Communication recommendations and installation diagrams
- Recommended Historian and reporting additions
- Timeline for five-year implementation

Deliverables: Draft and Final Master Plan Report

### C. Project Schedule

The anticipated project schedule is summarized below.

| Milestone                                    | Date                |
|----------------------------------------------|---------------------|
| Pre-Proposal Meeting                         | 11/10/17            |
| Written Questions Due                        | 11/17/17            |
| Responses to Questions Posted                | 11/27/17            |
| Proposals Due                                | 12/1/17             |
| Consultant Interviews (at the City's Option) | 12/11/17 – 12/15/17 |
| Consultant Selection / Council Approval      | 1/9/18              |
| Notice to Proceed                            | 1/12/18             |
| Draft Assessment Report                      | 2/9/18              |
| Final Assessment Report                      | 3/2/18              |
| Draft Goals and Metrics Technical Memorandum | 3/23/18             |
| Final Goals and Metrics Technical Memorandum | 4/20/18             |
| Draft Master Plan Report                     | 5/4/18              |
| Final Master Plan Report                     | 6/1/18              |

## GENERAL TERMS AND CONDITIONS

### A. Proposal Requirements

#### 1. Requirement to Meet All Provisions.

Each individual or firm submitting a proposal shall meet all of the terms and conditions of the Request for Proposals (RFP) package. By virtue of its proposal submittal, proposing consultant acknowledges agreement with and acceptance of all provisions of the RFP specifications.

#### 2. Proposal Submittal.

Each proposal must be submitted on the form(s) provided in the RFP and accompanied by any other required submittals or supplemental materials.

#### 3. Insurance Certificate.

Each proposal must include a current certificate of insurance showing:

- a. The insurance carrier and its A.M. Best rating.
- b. Scope of coverage and limits.
- c. Deductibles and self-insured retention.

The purpose of this submittal is to generally assess the adequacy of the proposing consultant's insurance coverage during proposal evaluation; endorsements are not required until contract award.

#### 4. Proposal Withdrawal and Opening.

A proposing consultant may withdraw its proposal, without prejudice, prior to the time specified for the proposal opening, by submitting a written request to the Public Works Director for its withdrawal, in which event the proposal will be returned to the consultant unopened. The City will not consider proposals received after the time specified or at any place other than that stated in the "Notice Requesting Proposals." The City will open and declare all proposals in public. Proposing consultants or their representatives are invited to be present at the opening of the proposals.

#### 5. Submittal of One Proposal Only.

No individual or business entity of any kind shall be allowed to make or file, or to be interested in more than one proposal, except an alternative proposal when specifically requested in writing by the City; however, an individual or business entity which has submitted a sub-proposal to a proposing consultant submitting a proposal, or who has quoted prices on materials to such proposing consultant, is not thereby disqualified from submitting a sub-proposal or from quoting prices to other proposing consultants submitting proposals.

#### 6. Content:

The Proposal shall be concise, well organized and demonstrate the proposer's understanding of the Project and their applicable qualifications and experience. The proposal shall be limited to twenty (20) pages, double sided, exclusive of resumes, cover letter (2 pages), graphics, fee schedule, project schedule, and covers. Proposals should include the minimum Proposal Content as described in Section IV. Any additional materials that will support your Proposal may be included. However, if they do not directly address the stated requirements, please include them

in a separate appendix. The City will consider all material submitted within the page limit, but concentrate on that which addresses the City's Project requirements.

7. Subconsultants:

Identify all subconsultants to be used during the term of the project and provide a list of responsible staff and their qualifications.

8. Insurance:

The consultant shall obtain at their own cost an insurance policy meeting the City's requirements as described in the City's Standard Agreement (Appendix A).

9. Consultant's Compensation:

The Consultant shall include a breakdown of labor, subconsultants, and other direct costs with estimated fees; a fee schedule with hourly rates; and the basis for charging other direct costs (including materials, travel, and subconsultants).

10. Commitment:

The Proposal shall be signed by the individual with power to bind the company to the scope of work and approach identified in the document. Parts or the entire Proposal will be the basis for the subsequent proposal and contract for the work.

11. Statement of Contract Disqualifications:

Consultant shall include a signed statement of whether it or any of its employees or officers who have a proprietary interest in it has ever been disqualified, removed or otherwise prevented from proposing on or completing a municipal government project for any reason. If so, provide a description and explanation of the circumstances.

12. Exceptions:

Consultant shall certify that they take no exceptions to this RFP, including but not limited to the provisions of the City's Standard Agreement (**Appendix A**). If the Consultant takes any exceptions, identify the specific portion and provide a full explanation.

**B. Contract Award and Execution**

1. The City reserves the right to retain all proposals for a period of 60 days for examination and comparison. The City also reserves the right to waive non-substantial irregularities in any proposal, to reject any or all proposals, to reject or delete one part of a proposal and accept the other, except to the extent that proposals are qualified by specific limitations. The special terms and conditions of these specifications include proposal evaluation and contract award criteria.
2. The City reserves full discretion to determine the competence and responsibility, professionally and/or financially, of proposing consultants. Proposing consultants will provide, in a timely manner, all information that the City deems necessary to make such a decision.

3. The proposing consultant to whom award is made (Consultant) shall execute a written contract with the City within ten (10) calendar days after notice of the award has been sent by mail to it at the address given in its proposal. The contract shall be made in substantially the form adopted by the City and incorporated in these specifications.
4. Even if selected, the City reserves the right to terminate any agreement reached with the selected firm at any time and in an appropriate manner.
5. The proposing consultant to whom award is made (Consultant) shall execute a written contract with the City within ten (10) calendar days after notice of the award has been sent by mail to it at the address given in its proposal. The contract shall be made in substantially the form adopted by the City and incorporated in these specifications.
6. The Consultant shall provide insurance policies and endorsements of insurance policies in the form, coverages, and amounts specified in the Consultant Services Agreement within 10 (ten) calendar days after notice of contract award as a precondition to contract execution.
7. The Consultant must have a valid City of Morro Bay business license prior to execution of the contract. Additional information regarding the City's business license program is available at the City of Morro Bay City Hall at 595 Harbor Street, Morro Bay, CA, 93442, (805) 772-6200.

### **III. PROPOSAL CONTENT AND SELECTION PROCESS**

#### **A. Proposal Content**

1. Cover Letter/Executive Summary
2. Project Organization and Key Personnel – Provide a project organization chart showing the names of all key personnel assigned to the Project and their primary responsibility. Any changes in key personnel and subconsultants after the award of contract must be proposed in writing and approved by the City before any change is made.
3. Experience and References - Include professional references for five (5) similar projects performed with the proposed project team members. Provide project descriptions and current contact information for references that illustrate the quality of past performance of the project team.
4. Project Understanding – Describe the consultant's understanding of the project. Identify the potential challenges and critical tasks, the recommended project approach, and describe how the consultant's team is best suited to address the key issues.
5. Proposed Scope of Work – Address and detail all the tasks identified in this RFP. Additional tasks identified during development of the RFP that may be applicable may be included as optional. Include a project schedule showing anticipated completion time for each task.

6. Proposed Compensation
7. Exceptions, statement of past disqualifications, insurance certificate, and other items identified in Section III and throughout the remainder of this RFP.
8. Resumes – Include resumes of all key personnel, including subconsultants, tailored for this project.
9. Submittal Forms and Requirements
  - Certificate of insurance
  - Subconsultant list
  - References from at least three firms for whom you have provided similar services (use form in proposal package)
  - Statement and explanation of any instances regarding past governmental agency bidding or contract disqualifications or removal from a project.

**B. Proposal Evaluation and Consultant selection**

1. Selection Criteria

Proposals will be evaluated by a review committee based on the following criteria:

| <b>Criteria</b>                                                                                                                                                                                                                                                                                    | <i>Points</i> |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| 1. Understanding of the Scope of Work (e.g. completeness of proposal; demonstrated grasp of work to be completed under this contract; expressed understanding of the project scope, objectives, and complexity).                                                                                   | 15            |
| 2. Past performance and related experience of firm in planning, implementing, and integrating new water and wastewater SCADA systems with existing and new facilities (e.g. previous experience in performing similar projects, results of reference checks, administrative information)           | 30            |
| 3. Expertise of technical and professional team members assigned to the project (e.g. team qualifications, specialized experience, professional competency of members in critical aspects, proven innovative approaches/techniques, knowledge of issues associated with the facility master plan). | 25            |
| 4. Proposed project approach (e.g. conceptual and technical approach in preparing the plan, including assurance of the consultant’s ability to provide deliverables in a timely fashion and with high quality).                                                                                    | 20            |
| 6. Demonstrated ability to conform to City contract requirements (The City’s standard general consultant contract is attached to this Request for Proposals).                                                                                                                                      | 10            |
| Total                                                                                                                                                                                                                                                                                              | 100           |

## 2. Contract Award

Subject to the reservations set forth in Section B of the General Terms and Conditions of these specifications, the City will award the contract to the most qualified, responsible, responsive proposing consultant, using the proposal evaluation and selection criteria.

Following the award of contract, the consultant will negotiate with the City a final compensation and payment schedule tied to accomplishing key tasks. The proposed compensation and payment schedule shall be tabulated in spreadsheet form, presenting each task complete with the level of effort from each team member. The Consultant shall monitor costs throughout the project. The “not to exceed fee” for this project will not be increased unless the scope of work is amended to include additional consulting services. Any increase in fees for additional consulting services must be confirmed in writing by the City **prior** to undertaking extra work.

## 3. Failure to Accept Contract

The following will occur if the Consultant whose proposal is accepted fails or refuses to enter into the contract: the City may negotiate with the next most qualified proposing consultant.

## 4. Ownership of Materials

All original drawings, plan documents, computer models and other materials prepared by or in possession of the Consultant as part of the work or services under these specifications shall become the permanent property of the City. The Consultant shall deliver any or all of these materials and documents to the City upon demand.

## 5. Release of Reports and Information

Any reports, information, data, or other material given to, prepared by or assembled by the Consultant as part of the work or services under these specifications shall be the property of City and shall not be made available to any individual or organization by the Consultant without the prior written approval of the City.

## 6. Copies of Reports and Information

If the City request additional copies of reports, drawings, specifications, or any other material in addition to what the Consultant is required to furnish in limited quantities as part of the work or services under these specifications, the Consultant shall provide such additional copies as are requested, and City shall compensate the Consultant for the costs of duplicating of such copies at the Consultant's direct expense.

## 7. Accuracy of Scope of Consultant Services

The City finds the Scope of Consultant Services for this project to be accurate and to contain no affirmative misrepresentation or any concealment of fact. Although the effect of ambiguities or defects in the Scope will be as determined by law, any patent ambiguity or defect shall give rise to a duty of proposing consultant to inquire prior to proposal submittal. To the extent that the Scope of Consultant Services constitute performance parameters, the City shall not be liable for costs incurred by the successful proposing consultant to achieve the project's objectives or standards beyond the amounts provided therefore in the proposal.

**V. PROPOSAL SUBMITTAL FORMS**

**Subconsultant Listing**

**References**

**Statements of Past Contract Disqualification**

## SUBCONSULTANT LISTING

Describe briefly the work scope of each sub-consultant. Attach additional pages if required.

### Sub-consultant

|                                         |  |
|-----------------------------------------|--|
| Company Name                            |  |
| Contact Individual                      |  |
| Telephone & FAX number                  |  |
| Street Address                          |  |
| City, State, Zip Code                   |  |
| Description of services to be provided. |  |

### Sub-consultant

|                                        |  |
|----------------------------------------|--|
| Company Name                           |  |
| Contact Individual                     |  |
| Telephone & FAX number                 |  |
| Street Address                         |  |
| City, State, Zip Code                  |  |
| Description of services to be provided |  |

### Sub-consultant

## Appendices

A.  
City Consultant Agreement

CITY OF MORRO BAY

AGREEMENT FOR CONSULTANT SERVICES

THIS AGREEMENT is made, by and between, the City of Morro Bay, a municipal corporation (“City”) and \_\_\_\_\_, a California corporation, *and/or* [insert individual’s name] dba [insert business name if not a corporation] (“Consultant”). In consideration of the mutual covenants and conditions set forth herein the parties agree as follows:

1. TERM

This Agreement shall commence on \_\_\_\_\_, 20\_\_, and shall remain and continue in effect until tasks described herein are completed, but in no event later than \_\_\_\_\_, 20\_\_, unless sooner terminated pursuant to the provisions of this Agreement.

2. SERVICES

Consultant shall perform the tasks described and set forth in Exhibit A, attached hereto and incorporated herein as though set forth in full. Consultant shall complete the tasks according to the schedule of performance which is also set forth in Exhibit A.

3. PERFORMANCE

Consultant shall at all times faithfully, competently and to the best of their ability, experience, and talent, perform all tasks described herein. Consultant shall employ, at a minimum, generally accepted standards and practices utilized by persons engaged in providing similar services as are required of Consultant hereunder in meeting its obligations under this Agreement.

4. CITY MANAGEMENT

City’s \_\_\_\_\_ Director shall represent City in all matters pertaining to the administration of this Agreement, review and approval of all products submitted by Consultant, but not including the authority to enlarge the Tasks to Be Performed or change the compensation due to Consultant. City’s City Manager shall be authorized to act on City’s behalf and to execute all necessary documents which enlarge the Tasks to Be Performed or change Consultant’s compensation, subject to Section 5 hereof.

5. PAYMENT

(a) City agrees to pay Consultant monthly, in accordance with the payment rates and terms and the schedule of payment as set forth in Exhibit A, attached hereto and incorporated herein by this reference as though set forth in full, and based upon actual time spent on the above

tasks. That amount shall not exceed *{INSERT AMOUNT IN THE FOLLOWING FORMAT}. Twenty-five Thousand, Seven Hundred Fifty-three Dollars and No Cents (\$25,753.00)* for the total term of the Agreement unless additional payment is approved as provided in this Agreement.

(b) Consultant shall not be compensated for any services rendered in connection with its performance of this Agreement which are in addition to those set forth herein, unless such additional services are authorized in advance and in writing by the City Manager. Consultant shall be compensated for any additional services in the amounts and in the manner as agreed to by City Manager and Consultant at the time City's written authorization is given to Consultant for the performance of said services. The City Manager may approve additional work not to exceed twenty five (25%) of the amount of the Agreement, but in no event shall such sum exceed *{INSERT AMOUNT 25% OF THE ABOVE TOTAL, IN THE FOLLOWING FORMAT} Six Thousand, Four Hundred Thirty-eight Dollars and Twenty-five cents (\$6,438.25)*. Any additional work in excess of this amount shall be approved by the City Council.

(c) Consultant will submit invoices monthly for actual services performed. Invoices shall be submitted on or about the first business day of each month, or as soon thereafter as practical, for services provided in the previous month. Payment shall be made within thirty (30) days after receipt of each invoice as to all non-disputed fees. If City disputes any of Consultant's fees, then it shall give written notice to Consultant within fifteen (15) days of receipt of an invoice of any disputed fees set forth on the invoice.

## 6. SUSPENSION OR TERMINATION OF AGREEMENT WITHOUT CAUSE

(a) City may at any time, for any reason, with or without cause, suspend or terminate this Agreement, or any portion hereof, by serving upon Consultant at least ten-days' (10-days') prior written notice. Upon receipt of said notice, Consultant shall immediately cease all work under this Agreement, unless the notice provides otherwise. If City suspends or terminates a portion of this Agreement, then such suspension or termination shall not make void or invalidate the remainder of this Agreement.

(b) In the event this Agreement is terminated pursuant to this Section, City shall pay to Consultant the actual value of the work performed up to the time of termination. Upon termination of the Agreement pursuant to this Section, Consultant will submit an invoice to City pursuant to Section 3.

## 7. DEFAULT OF CONSULTANT

(a) Consultant's failure to comply with the provisions of this Agreement shall constitute a default. In the event Consultant is in default for cause under the terms of this Agreement, City shall have no obligation or duty to continue compensating Consultant for any work performed after the date Consultant is notified of default and can terminate this Agreement immediately by written notice to Consultant. If such failure by Consultant to make progress in the performance for work hereunder arises out of causes beyond Consultant's control, and without fault or negligence of Consultant, then it shall not be considered a default.

(b) If the City Manager of his/her delegate determines that Consultant is in default in the performance of any of the terms or conditions of this Agreement, then he/she shall cause to be served upon Consultant a written notice of the default. Consultant shall have ten (10) days after service upon it of said notice in which to cure the default by rendering a satisfactory performance. In the event that Consultant fails to cure its default within such period of time, City shall have the right, notwithstanding any other provision of this Agreement, to terminate this Agreement without further notice and without prejudice to any other remedy to which it may be entitled at law, in equity or under this Agreement.

## 8. OWNERSHIP OF DOCUMENTS

(a) Consultant shall maintain complete and accurate records with respect to sales, costs, expenses, receipts, and other such information required by City that relate to the performance of services under this Agreement. Consultant shall maintain adequate records of services provided in sufficient detail to permit an evaluation of services. All such records shall be maintained in accordance with generally accepted accounting principles and shall be clearly identified and readily accessible. Consultant shall provide free access to the representatives of City or its designees at reasonable times to such books and records; shall give City the right to examine and audit said books and records; shall permit City to make transcripts therefrom as necessary; and shall allow inspection of all work, data, documents, proceedings, and activities related to this Agreement. Such records, together with supporting documents, shall be maintained for a period of three (3) years after receipt of final payment.

(b) Upon completion of, and full payment by City for services performed pursuant to, this Agreement, all final work product such as documents, designs, drawings, maps, models, computer files, surveys, notes, and other documents prepared in the course of providing the services to be performed pursuant to this Agreement shall become the sole property of City and may be used, reused, or otherwise disposed of by City without the permission of Consultant. With respect to computer files, Consultant shall make available to City, as a service in addition to those set forth herein, at Consultant's office and upon reasonable written request by City, the necessary computer software and hardware for purposes of accessing, compiling, transferring, and printing computer files.

## 9. INDEMNIFICATION

(a) Indemnification for Professional Liability. When the law establishes a professional standard of care for Consultant's Services, to the fullest extent permitted by law, Consultant shall indemnify, protect, defend and hold harmless City and any and all of its officials, employees and agents ("Indemnified Parties") from and against any and all losses, liabilities, damages, costs and expenses, including reasonable attorney's fees and costs to the extent same are caused by any negligent act, error or omission of Consultant, its officers, agents, employees or subconsultants (or any entity or individual that Consultant shall bear the legal liability thereof) in the performance of professional services under this agreement. City agrees to hold harmless and indemnify Consultant from and against all claims, liabilities, losses, damages, and costs, including but not limited to attorney's fees, arising out of or in any way connected with the

modification, misinterpretation, misuse or reuse by others of the computer files or any other document provided by Consultant under this Agreement.

(b) Indemnification for Other Than Professional Liability. Other than in the performance of professional services and to the full extent permitted by law, Consultant shall indemnify, defend and hold harmless City, and any and all of its employees, officials and agents from and against any liability (including liability for claims, suits, actions, arbitration proceedings, administrative proceedings, regulatory proceedings, losses, expenses or costs of any kind, whether actual, alleged or threatened, including attorneys' fees and costs, court costs, interest, defense costs, and expert witness fees), where the same arise out of, are a consequence of, or are in any way attributable to, in whole or in part, the performance of this Agreement by Consultant or by any individual or entity for which Consultant is legally liable, including but not limited to officers, agents, employees or subconsultants of Consultant.

(c) General Indemnification Provisions. Consultant agrees to obtain executed indemnity agreements with provisions identical to those set forth here in this section from each and every subconsultant or any other person or entity involved by, for, with or on behalf of Consultant in the performance of this agreement. In the event Consultant fails to obtain such indemnity obligations from others as required here, Consultant agrees to be fully responsible according to the terms of this section. Failure of City to monitor compliance with these requirements imposes no additional obligations on City and will in no way act as a waiver of any rights hereunder. This obligation to indemnify and defend City as set forth here is binding on the successors, assigns or heirs of Consultant and shall survive the termination of this agreement or this section.

## 10. INSURANCE

Consultant shall maintain prior to the beginning of and for the duration of this Agreement insurance coverage as specified in Exhibit B attached to and part of this agreement.

## 11. INDEPENDENT CONSULTANT

(a) Consultant is and shall at all times remain as to City a wholly independent Consultant. The personnel performing the services under this Agreement on behalf of Consultant shall at all times be under Consultant's exclusive direction and control. Neither City nor any of its officers, employees, or agents shall have control over the conduct of Consultant or any of Consultant's officers, employees, or agents, except as set forth in this Agreement. Consultant shall not at any time or in any manner represent that it or any of its officers, employees, or agents are in any manner officers, employees, or agents of City. Consultant shall not incur or have the power to incur any debt, obligation, or liability whatever against City, or bind City in any manner.

(b) No employee benefits shall be available to Consultant in connection with the performance of this Agreement. Except for the fees paid to Consultant as provided in the Agreement, City shall not pay salaries, wages, or other compensation to Consultant for performing services hereunder for City. City shall not be liable for compensation or indemnification to Consultant for injury or sickness arising out of performing services hereunder.

12. LEGAL RESPONSIBILITIES

Consultant shall keep itself informed of State and Federal laws and regulations which in any manner affect those employed by it or in any way affect the performance of its service pursuant to this Agreement. Consultant shall at all times observe and comply with applicable legal requirements in effect at the time the drawings and specifications are prepared. City, and its officers and employees, shall not be liable at law or in equity occasioned by failure of Consultant to comply with this Section.

13. UNDUE INFLUENCE

Consultant declares and warrants that no undue influence or pressure is used against or in concert with any officer or employee of City in connection with the award, terms or implementation of this Agreement, including any method of coercion, confidential financial arrangement, or financial inducement. No officer or employee of City will receive compensation, directly or indirectly, from Consultant, or from any officer, employee or agent of Consultant, in connection with the award of this Agreement or any work to be conducted as a result of this Agreement. Violation of this Section shall be a material breach of this Agreement entitling City to any and all remedies at law or inequity.

14. NO BENEFIT TO ARISE TO LOCAL EMPLOYEES

No member, officer, or employee of City, or their designees or agents, and no public official who exercises authority over or responsibilities with respect to the Project during his/her tenure or for one year thereafter, shall have any interest, direct or indirect, in any agreement or sub-agreement, or the proceeds thereof, for work to be performed in connection with the Project performed under this Agreement.

15. RELEASE OF INFORMATION/CONFLICTS OF INTEREST

(a) All information gained by Consultant in performance of this Agreement shall be considered confidential and shall not be released by Consultant without City's prior written authorization. Consultant, its officers, employees, agents, or subconsultants, shall not without written authorization from the City Manager or unless requested by the City Attorney, voluntarily provide declarations, letters of support, testimony at depositions, response to interrogatories, or other information concerning the work performed under this Agreement or relating to any project or property located within City. Response to a subpoena or court order shall not be considered "voluntary" provided Consultant gives City notice of such court order or subpoena.

(b) Consultant shall promptly notify City if Consultant, or any of its officers, employees, agents, or subconsultants are served with any summons, complaint, subpoena, notice of deposition, request for documents, interrogatories, request for admissions, or other discovery request, court order, or subpoena from any person or party regarding this Agreement and the work performed thereunder or with respect to any project or property located within City. City retains the right, but has no obligation, to represent Consultant or be present at any deposition,

hearing, or similar proceeding. Consultant agrees to cooperate with City by providing the opportunity to review any response to discovery requests provided by Consultant. However, City's right to review any such response does not imply or mean the right by City to control, direct, or rewrite said response.

16. NOTICES

Any notices which either party may desire to give to the other party under this Agreement must be in writing and may be given either by (i) personal service, (ii) delivery by a reputable document delivery service, such as but not limited to, Federal Express, which provides a receipt showing date and time of delivery, or (iii) mailing in the United States Mail, certified mail, postage prepaid, return receipt requested, addressed to the address of the party as set forth below or at any other address as that party may later designate by notice:

To City: City of Morro Bay  
595 Harbor Street  
Morro Bay, CA 93442  
Attention: **City Clerk**

To Consultant:

17. ASSIGNMENT

Consultant shall not assign the performance of this Agreement, nor any part thereof, nor any monies due hereunder, without prior written consent of City.

18. LICENSES

At all times during the term of this Agreement, Consultant shall have in full force and effect, all licenses and tax certificates required of it by law for the performance of the services described in this Agreement.

19. GOVERNING LAW

City and Consultant understand and agree that the laws of the State of California shall govern the rights, obligations, duties, and liabilities of the parties to this Agreement and also govern the interpretation of this Agreement. Any litigation concerning this Agreement shall take place in the municipal, superior, or federal district court with jurisdiction over City.

20. ENTIRE AGREEMENT

This Agreement contains the entire understanding between the parties relating to the obligations of the parties described in this Agreement. All prior or contemporaneous agreements, understandings, representations, and statements, oral or written, are merged into this Agreement and shall be of no further force or effect. Each party is entering into this Agreement based solely upon the representations set forth herein and upon each party's own independent investigation of any and all facts such party deems material.

21. CONTENTS OF PROPOSAL

Consultant is bound by the contents of the proposal submitted by Consultant, Exhibit A hereto.

22. AUTHORITY TO EXECUTE THIS AGREEMENT

The person or persons executing this Agreement on behalf of Consultant warrants and represents he/she has the authority to execute this Agreement on behalf of Consultant and has the authority to bind Consultant to the performance of its obligations hereunder.

IN WITNESS WHEREOF, the parties hereto have caused this Agreement to be executed the day and year first above written.

**EXHIBIT A**

**TASKS TO BE PERFORMED**

**EXHIBIT B**  
**PAYMENT SCHEDULE**

**EXHIBIT C**  
**INSURANCE REQUIREMENTS**

*Prior to the beginning of and throughout the duration of the Agreement, Consultant will maintain insurance in conformance with the requirements set forth below. Consultant will use existing coverage to comply with these requirements. If that existing coverage does not meet the requirements set forth here, Consultant agrees to amend, supplement or endorse the existing coverage to do so. Consultant acknowledges that the insurance coverage and policy limits set forth in this section constitute the minimum amount of coverage required. Any insurance proceeds available to City in excess of the limits and coverage required in this agreement and which is applicable to a given loss, will be available to City.*

*Consultant shall provide the following types and amounts of insurance:*

Commercial General Liability Insurance using Insurance Services Office “Commercial General Liability” policy from CG 00 01 or the exact equivalent. Defense costs must be paid in addition to limits. There shall be no cross liability exclusion for claims or suits by one insured against another. Limits are subject to review but in no event less than \$1,000,000 per occurrence.

Business Auto Coverage on ISO Business Auto Coverage from CA 00 01 including symbol 1 (Any Auto) or the exact equivalent. Limits are subject to review, but in no event to be less than \$1,000,000 per accident. If Consultant owns no vehicles, this requirement may be satisfied by a non-owned auto endorsement to the general liability policy described above. If Consultant or Consultant’s employees will use personal autos in any way to perform the Scope of Services, then Consultant shall provide evidence of personal auto liability coverage for each such person.

Property Damage Insurance in an amount of not less than \$1,000,000 for damage to the property of each person on account of any one occurrence.

Workers Compensation on a state-approved policy form providing statutory benefits as required by law with employer’s liability limits.

Excess or Umbrella Liability Insurance (Over Primary) if used to meet limit requirements, shall provide coverage at least as broad as specified for the underlying coverages. Any such coverage provided under an umbrella liability policy shall include a drop down provision providing primary coverage above a maximum \$25,000 self-insured retention for liability not covered by primary but covered by the umbrella. Coverage shall be provided on a “pay on behalf” basis, with defense costs payable in addition to policy limits. Policy shall contain a provision obligating insurer at the time insured’s liability is determined, not requiring actual payment by the insured first. There shall be no cross liability exclusion precluding coverage for claims or suits by one insured against another. Coverage shall be applicable to City for injury to employees of Consultant, subcontractors or others involved in the Work. The scope of coverage provided is subject to approval of City following receipt of proof of insurance as required herein. Limits are subject to review but in no event less than \$1,000,000 per occurrence.

Professional Liability or Errors and Omissions Insurance as appropriate shall be written on a policy form coverage specifically designated to protect against acts, errors or omissions of Consultant and "Covered Professional Services" as designated in the policy must specifically include work performed under this agreement. The policy limit shall be no less than \$2,000,000 per claim and in the aggregate. The policy must "pay on behalf of" the insured and must include a provision establishing the insurer's duty to defend. The policy retroactive date shall be on or before the effective date of this agreement.

*Insurance procured pursuant to these requirements shall be written by insurer that are admitted carriers in the state California and with an A.M. Best's rating of A- or better and a minimum financial size VII.*

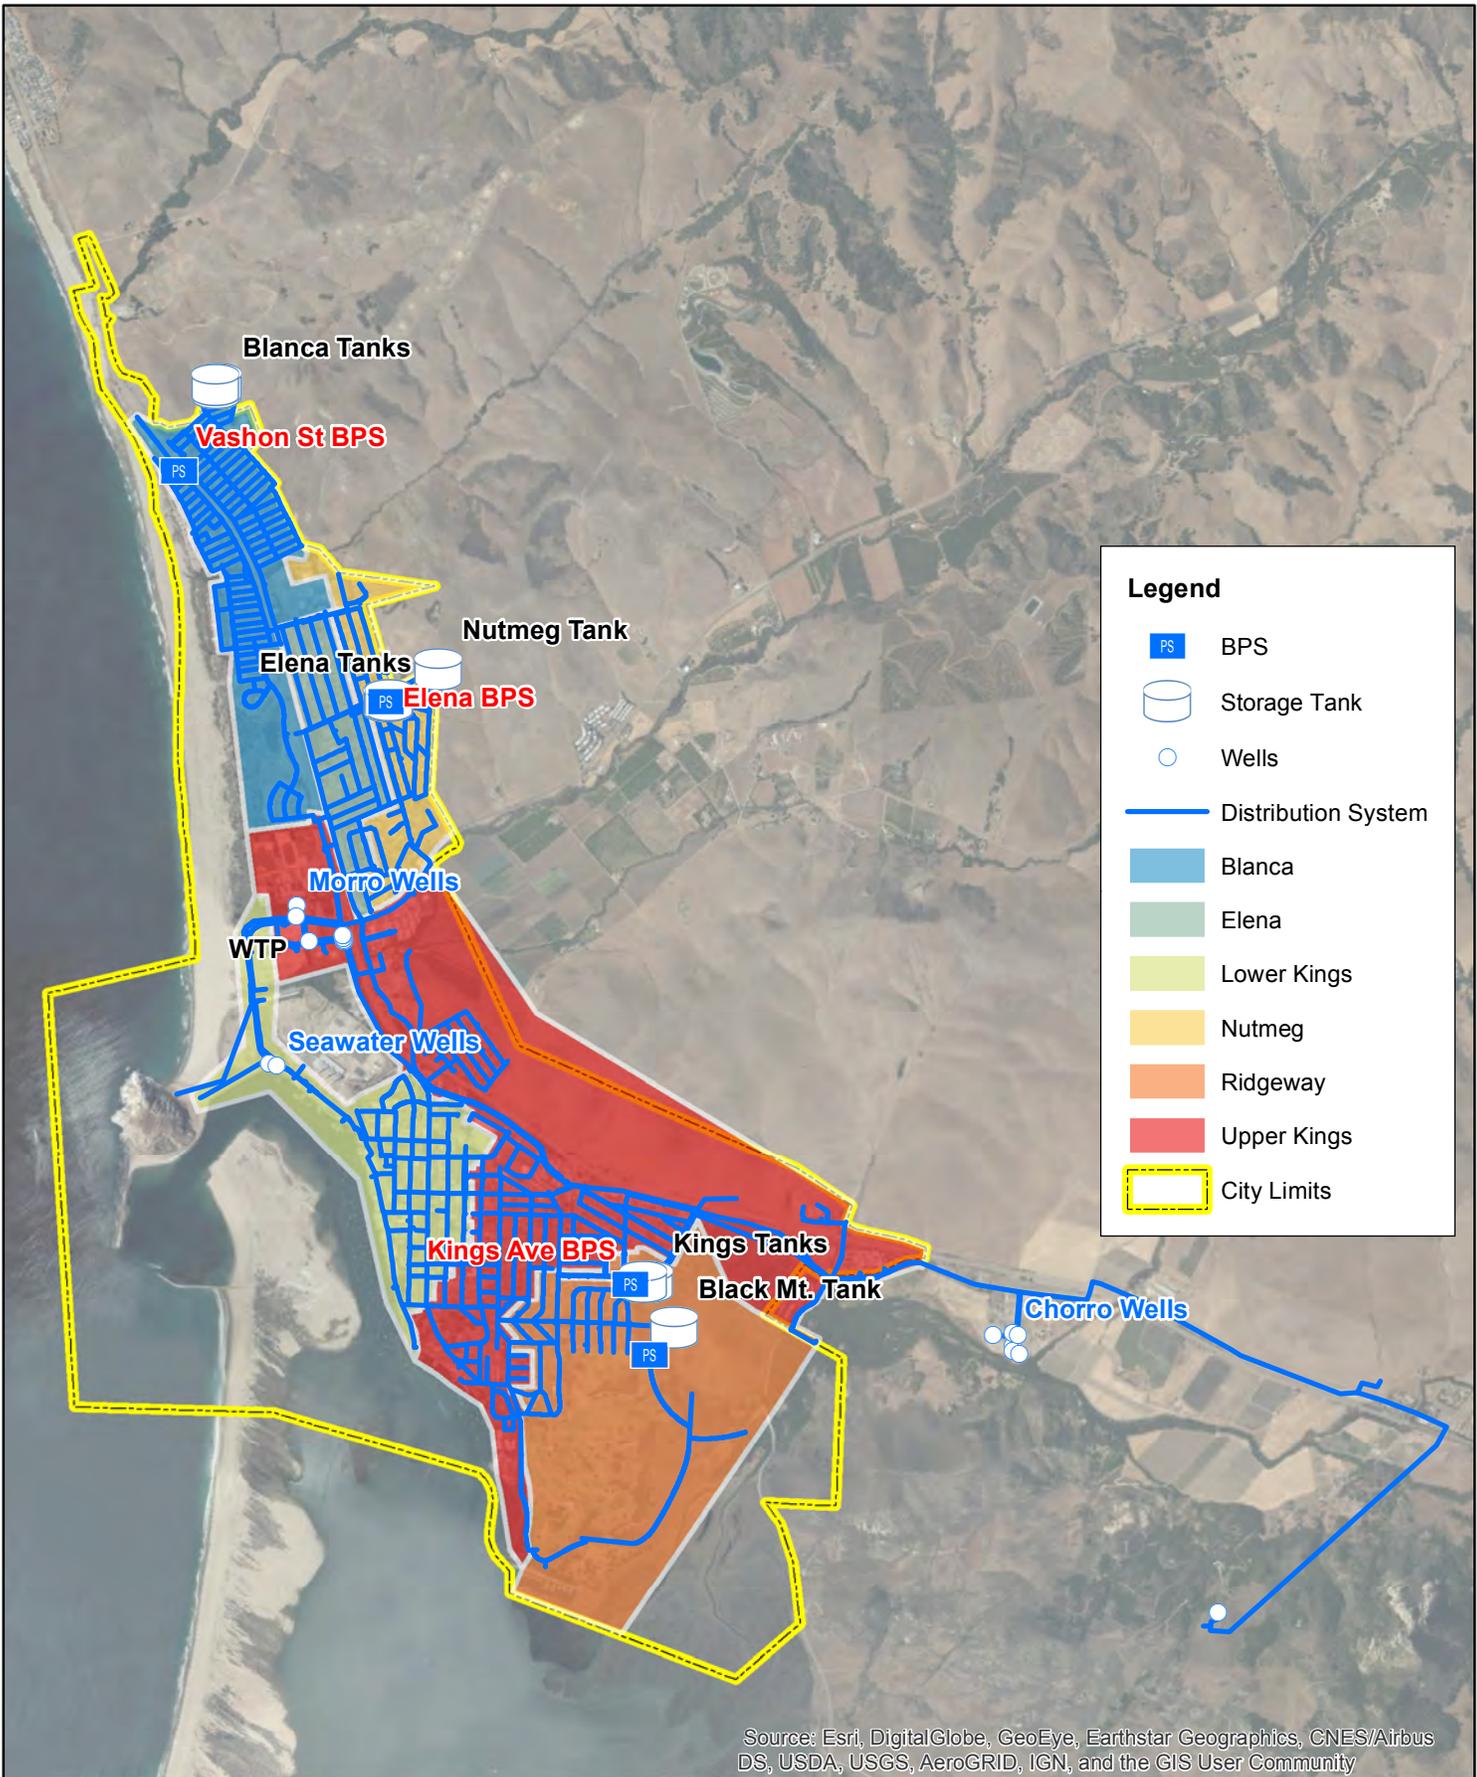

General conditions pertaining to provision of insurance coverage by Consultant. Consultant and City agree to the following with respect to insurance provided by Consultant:

1. Consultant agrees to have its insurer endorse the third party general liability coverage required herein to include as additional insureds the City of Morro Bay, its officials, employees and agents, using standard ISO endorsement No. CG 2010 with an edition prior to 1992. Consultant also agrees to require all Consultants, and subcontractors to do likewise.
2. No liability insurance coverage provided to comply with this Agreement shall prohibit Consultant, or Consultant's employees, or agents, from waiving the right of subrogation prior to a loss. Consultant agrees to waive subrogation rights against City regardless of the applicability of any insurance proceeds, and to require all Consultants and subcontractors to do likewise.
3. All insurance coverage and limits provided by Consultant and available or applicable to this agreement are intended to apply to the full extent of the policies. Nothing contained in this Agreement or any other agreement relating to City or its operations limits the application of such insurance coverage.
4. None of the coverages required herein will be in compliance with these requirements if they include any limiting endorsement of any kind that has not been first submitted to City and approved of in writing.
5. No liability policy shall contain any provision or definition that would serve to eliminate so-called "third party action over" claims, including any exclusion for bodily injury to an employee of the insured or of any Consultant or subcontractor.
6. All coverage types and limits required are subject to approval, modification and additional requirements by City, as the need arises. Consultant shall not make any reductions in scope of coverage (e.g. elimination of contractual liability or reduction of discovery period) that may affect City's protection without City's prior written consent.

7. Proof of compliance with these insurance requirements, consisting of certificates of insurance evidencing all of the coverages required and an additional insured endorsement to Consultant's general liability policy, shall be delivered to City at or prior to the execution of this Agreement. In the event such proof of any insurance is not delivered as required, or in the event such insurance is canceled at any time and no replacement coverage is provided, City has the right, but not the duty, to obtain any insurance it deems necessary to protect its interests under this or any other agreement and to pay the premium. Any premium so paid by City shall be charged to and promptly paid by Consultant or deducted from sums due Consultant, at City's option.
8. It is acknowledged by the parties of this agreement that all insurance coverage required to be provided by Consultant or any subcontractor, is intended to apply first and on a primary, noncontributing basis in relation to any other insurance or self-insurance available to City.
9. Consultant agrees to ensure that subcontractors, and any other party involved with the Scope of Services who is brought onto or involved in the Scope of Services by Consultant, provide the same minimum insurance coverage required of Consultant. Consultant agrees to monitor and review all such coverage and assumes all responsibility for ensuring that such coverage is provided in conformity with the requirements of this section. Consultant agrees that upon request, all agreements with subcontractors and others engaged in the Scope of Services will be submitted to City for review.
10. Consultant agrees not to self-insure or to use any self-insured retentions or deductibles on any portion of the insurance required herein and further agrees that it will not allow any Consultant, Subcontractor, Architect, Engineer or other entity or person in any way involved in the performance of the Scope of Services to self-insure its obligations to City. If Consultant's existing coverage includes a deductible or self-insured retention, the deductible or self-insured retention must be declared to City. At the time City shall review options with Consultant, which may include reduction or elimination of the deductible or self-insured retention, substitution of other coverage, or other solutions.
11. City reserves the right at any time during the term of the contract to change the amounts and types of insurance required by giving Consultant ninety (90) days advance written notice of such change. If such change results in substantial additional cost to Consultant, the City will negotiate additional compensation proportional to the increase benefit to City.
12. For purposes of applying insurance coverage only, this Agreement will be deemed to have been executed immediately upon any party hereto taking any steps that can be deemed to be in furtherance of or towards performance of this Agreement.
13. Consultant acknowledges and agrees that any actual or alleged failure on the part of City to inform Consultant of non-compliance with any insurance requirements in no way imposes any additional obligations on City nor does it waive any rights hereunder in this or any other regard.

14. Consultant will renew the required coverage annually as long as City, or its employees or agents face an exposure from operations of any type pursuant to this agreement. This obligation applies whether or not the agreement is canceled or terminated for any reason. Termination of this obligation is not effective until City executes a written statement to that effect.
15. Consultant shall provide proof that policies of insurance required herein expiring during the term of this Agreement have been renewed or replaced with other policies providing at least the same coverage. Proof that such coverage has been ordered shall be submitted prior to expiration. A coverage binder or letter from Consultant's insurance agent to this effect is acceptable. A certificate of insurance and/or additional insured endorsement as required in these specifications applicable to the renewing or new coverage must be provided to City within five days of the expiration of the coverages.
16. The provisions of any workers' compensation or similar act will not limit the obligations of Consultant under this agreement. Consultant expressly agrees not to use any statutory immunity defenses under such laws with respect to City, its employees, officials and agents.
17. Requirements of specific coverage features or limits contained in this section are not intended as limitations on coverage, limits or other requirements nor as a waiver of any coverage normally provided by any given policy. Specific reference to a given coverage feature is for purposes of clarification only as it pertains to a given issue, and is not intended by any party or insured to be limiting or all-inclusive.
18. These insurance requirements are intended to be separate and distinct from any other provision in this agreement and are intended by the parties here to be interpreted as such.
19. The requirements in this Section supersede all other sections and provisions of this Agreement to the extent that any other section or provision conflicts with or impairs the provisions of this Section.
20. Consultant agrees to be responsible for ensuring that no contract used by any party involved in any way with the Scope of Services reserves the right to charge City or Consultant for the cost of additional insurance coverage required by this agreement. Any such provisions are to be deleted with reference to City. It is not the intent of City to reimburse any third party for the cost of complying with these requirements. There shall be no recourse against City for payment of premiums or other amounts with respect thereto.
21. Consultant agrees to provide immediate notice to City of any claim or loss against Consultant arising out of the work performed under this agreement. City assumes no obligation or liability by such notice, but has the right (but not the duty) to monitor the handling of any such claim or claims if they are likely to involve City.

|                                                                                                                                                                                                                                                                                                          |                   |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| This Order was adopted by the Central Coast Water Board on:                                                                                                                                                                                                                                              | December 7, 2017  |
| This Order shall become effective on:                                                                                                                                                                                                                                                                    | March 1, 2018     |
| This Order shall expire on:                                                                                                                                                                                                                                                                              | February 28, 2023 |
| The Discharger shall file a Report of Waste Discharge as an application for reissuance of waste discharge requirements in accordance with title 23, California Code of Regulations, and an application for reissuance of a National Pollutant Discharge Elimination System (NPDES) permit no later than: | September 1, 2022 |
| The U.S. Environmental Protection Agency (U.S. EPA) and the Central Coast Water Board have classified this discharge as follows:                                                                                                                                                                         | Major             |

IT IS HEREBY ORDERED, that Order No. R3-2008-0065 is superseded upon the effective date of this Order and, in order to meet the provisions contained in division 7 of the Water Code (commencing with section 13000) and regulations adopted thereunder and the provisions of the federal Clean Water Act (CWA) and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this amended Order.

John M. Robertson, Executive Officer

## I. FINDINGS

The California Regional Water Quality Control Board, Central Coast Region (hereinafter Central Coast Water Board) finds:

- A. Legal Authorities.** This Order serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the California Water Code (commencing with section 13260). This Order is also issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (U.S. EPA) and chapter 5.5, division 7 of the Water Code (commencing with section 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters.
- B. Background and Rationale for Requirements.** The Central Coast Water Board developed the requirements in this Order based on information submitted as part of the application, through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for the requirements in this Order, is hereby incorporated into and constitutes findings for this Order. Attachments A through E are also incorporated into this Order.
- C. Provisions and Requirements Implementing State Law.** The provisions/requirements in subsections III.B, III.C, and IV.B are included to implement state law only. These provisions/requirements are not required or authorized under the federal CWA; consequently, violations of these provisions/requirements are not subject to the enforcement remedies that are available for NPDES violations.
- D. Notification of Interested Parties.** The Central Coast Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Details of the notification are provided in the Fact Sheet of this Order.
- E. Consideration of Public Comment.** The Central Coast Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet of this Order.

THEREFORE, IT IS HEREBY ORDERED, that Order No. R3-2008-0065 is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions contained in division 7 of the Water Code (commencing with section 13000) and regulations adopted thereunder and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order. This action in no way prevents the Central Coast Water Board from taking enforcement action for past violations of the previous Order. If any part of this Order is subject to a temporary stay of enforcement, unless otherwise specified, the Discharger shall comply with the analogous portions of the previous Order, which shall remain in effect for all purposes during the pendency of the stay.

## II. DISCHARGE PROHIBITIONS

- A.** Discharge of treated wastewater to the Pacific Ocean at a location other than 35° 23' 11" N latitude and 120° 52' 29" W longitude is prohibited.
- B.** The discharge of any radiological, chemical, or biological warfare agent or high level radioactive waste to the Ocean is prohibited.

- C. The discharge of municipal or industrial waste sludge to the Pacific Ocean is prohibited. The discharge of sludge digester supernatant, without further treatment, directly to the Ocean or to a waste stream that discharges to the Ocean is prohibited.
- D. The overflow of bypass or wastewater from the Discharger’s collection, treatment, or disposal facilities and the subsequent discharge of untreated or partially treated wastewater, except as provided for in Attachment D, Standard Provision I.G.a (Bypass), is prohibited.
- E. Bypass of the treatment facility and discharge of any wastes not meeting the discharge specifications of this Order and permit are prohibited.
- F. The discharge of materials and substances in the wastewater that results in any of the following is prohibited:
  1. Float or become floatable upon discharge.
  2. May form sediments which degrade benthic communities or other aquatic life.
  3. Accumulate to toxic levels in marine waters, sediments, or biota.
  4. Decrease the natural light to benthic communities and other marine life.
  5. Result in aesthetically undesirable discoloration of the ocean surface.
- G. The discharge of chlorine or any other toxic substance used for disinfection and cleanup of sewage overflows to any surface water body is prohibited. This prohibition does not apply to the chlorine in the potable water used for final wash down and cleanup of overflows.

**III. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

**A. Effluent Limitations – Discharge Point No. 001**

**1. Final Effluent Limitations – Discharge Point No. 001**

The Discharger shall maintain compliance with the following effluent limitations at Discharge Point No. 001 with compliance measured at Monitoring Location EFF-001 as described in the attached MRP:

**Table 4. Effluent Limitations**

| Parameter                                                                 | Units                  | Effluent Limitations   |                |               |
|---------------------------------------------------------------------------|------------------------|------------------------|----------------|---------------|
|                                                                           |                        | Average Monthly        | Average Weekly | Maximum Daily |
| Biochemical Oxygen Demand 5-day @ 20°C (BOD <sub>5</sub> ) <sup>[1]</sup> | mg/L                   | 30                     | 45             | --            |
|                                                                           | lbs/day <sup>[2]</sup> | 515                    | 773            | --            |
| Total Suspended Solids (TSS) <sup>[1]</sup>                               | mg/L                   | 30                     | 45             | --            |
|                                                                           | lbs/day <sup>[2]</sup> | 515                    | 773            | --            |
| Oil and Grease                                                            | mg/L                   | 25                     | 40             | 75            |
|                                                                           | lbs/day <sup>[2]</sup> | 430                    | 687            | 1,289         |
| Settleable Solids                                                         | ml/L                   | 1.0                    | 1.5            | 3.0           |
| pH                                                                        | standard units         | 6.0 – 9.0 at all times |                |               |

| Parameter | Units | Effluent Limitations |                |               |
|-----------|-------|----------------------|----------------|---------------|
|           |       | Average Monthly      | Average Weekly | Maximum Daily |
| Turbidity | NTU   | 75                   | 100            | 225           |

<sup>[1]</sup> The average monthly percent removal for BOD<sub>5</sub> and TSS shall not be less than 85 percent.

<sup>[2]</sup> Mass based effluent limitations were calculated using the following formula:  
lbs/day = pollutant concentration (mg/L) \* Design flow (2.06 MGD) \* conversion factor (8.34)

**Table 5. Effluent Limitations, Protection of Marine Aquatic Life**

| Parameter                            | Units   | Effluent Limitation           |                              |                                      |

| Parameter | Units | Effluent Limitation           |                              |                                      |
|-----------|-------|-------------------------------|------------------------------|--------------------------------------|
|           |       | 6-Month Median <sup>[1]</sup> | Maximum Daily <sup>[2]</sup> | Instantaneous Maximum <sup>[3]</sup> |

- <sup>1]</sup> The six-month median shall apply as a moving median of daily values for any 180-day period in which daily values represent flow weighted average concentrations within a 24-hour period. For intermittent discharges, the daily value shall be considered equal to zero for days on which no discharge occurred. The six-month median limit on daily mass emissions shall be determined using the six-month medial effluent concentration  $C_e$  and the observed flow rate,  $Q$ , in million gallons per day (MGD).
- <sup>2]</sup> The daily maximum shall apply to flow weighted 24-hour composite samples. The daily maximum mass emission shall be determined using the daily maximum effluent concentration limit as  $C_e$  and the observed flow rate,  $Q$ , in MGD.
- <sup>3]</sup> The instantaneous maximum shall apply to grab sample determinations.
- <sup>4]</sup> Endosulfan shall mean the sum of endosulfan-alpha and -beta and endosulfan sulfate.
- <sup>5]</sup> HCH shall mean the sum of the alpha, beta, gamma (Lindane) and delta isomers of hexachlorocyclohexane.
- <sup>6]</sup> Not to exceed limits specified in Title 17, Division 1, Chapter 5, Subchapter 4, Group 3, Article 3, section 30253 of the California Code of Regulations.

**Table 6. Effluent Limitations – Protection of Human Health – Non-Carcinogens**

| Parameter                       | Units   | Effluent Limitation |
|---------------------------------|---------|---------------------|
|                                 |         | 30-day Average      |
| Acrolein                        | µg/L    | 29,500              |
|                                 | lbs/day | 507                 |

- [1] Sum of chlorodane-alpha, chlorodane-gamma, chlorodene-alpha, chlorodene-gamma, nonachlor-alpha, nonachlor gamma, and oxychlorodane.
- [2] Sum of 4,4'-DDT, 2,4'-DDT, 4,4'-DDE, 2,4'-DDE, 4,4'-DDD, and 2,4'-DDD.
- [3] Sum of bromoform, bromoethane (methyl bromide), chloromethane (methyl chloride), chlorodibromomethane, and dichlorobromomethane.
- [4] Sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,1,2-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[a,h]anthracene, fluorine, ideno[1,2,3-cd]pyrene, phenanthrene, and pyrene.
- [5] Sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.

2. **Percent Removal:** The average monthly percent removal of BOD 5-day 20°C and total suspended solids shall not be less than 85 percent.
3. **Dry Weather Flow.** Effluent peak seasonal dry weather flow shall not exceed a monthly average of 2.36 million gallons per day.
4. **Bacteria**
  - a. Total Coliform
    - i. The total coliform concentrations shall not exceed a 30-day geometric mean of 23 MPN/100 mL.
    - ii. No total coliform single sample shall exceed 2,400 MPN/100 mL.

**B. Land Discharge Specifications – Not Applicable**

**C. Recycling Specifications – Not Applicable**

**IV. RECEIVING WATER LIMITATIONS**

**A. Surface Water Limitation**

Receiving water limitations are based on water quality objectives contained in the Ocean Plan and Basin Plan and are a required part of this Order. The discharge shall not cause the following in the Pacific Ocean:

**1. Bacterial Characteristics**

- a. At all areas where shellfish may be harvested for human consumption, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column.
  - i. The median total coliform density shall not exceed 70 per 100 mL, and not more than 10 percent of the samples shall exceed 230 per 100 mL.
- b. Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline, and in areas outside this zone used for water contact sports, as determined by the Regional Board (i.e., waters designated REC-1), but including all kelp beds, the following bacterial objectives shall be maintained throughout the water column.
  - i. 30-day Geometric Mean – The following standards are based on the geometric mean of the five most recent samples from each site:
    - (a) Total coliform density shall not exceed 1,000 per 100 ml;
    - (b) Fecal coliform density shall not exceed 200 per 100 ml; and
    - (c) Enterococcus density shall not exceed 35 per 100 ml.
  - ii. Single Sample Maximum:
    - (a) Total coliform density shall not exceed 10,000 per 100 ml;
    - (b) Fecal coliform density shall not exceed 400 per 100 ml;
    - (c) Enterococcus density shall not exceed 104 per 100 ml; and
    - (d) Total coliform density shall not exceed 1,000 per 100 ml when the fecal coliform to total coliform ratio exceeds 0.1.

**2. Physical Characteristics**

- a. Floating particulates and grease and oil shall not be visible on the ocean surface.
- b. The discharge of waste shall not cause aesthetically undesirable discoloration of the ocean surface.
- c. Natural light shall not be significantly reduced at any point outside the zone of initial dilution as the result of the discharge of waste.
- d. The rate of deposition of inert solids and the characteristics of inert solids in ocean sediments shall not be changed such that benthic communities are degraded.

- e. Temperature of the receiving water shall not be altered to adversely affect beneficial uses, as set forth in the Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California.

### **3. Chemical Characteristics**

- a. The dissolved oxygen concentration shall not, at any time, be depressed more than 10 percent from that which occurs naturally, or fall below 5.0 mg/L, as the result of the discharge of oxygen demanding waste materials. The mean annual dissolved oxygen concentration shall not be less than 7.0 mg/L.
- b. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally, and shall be within the range of 7.0 to 8.5 at all times.
- c. The dissolved sulfide concentrations of waters in and near sediments shall not be significantly increased above that present under natural conditions.
- d. The concentrations of substances set forth in Table 1 of the Ocean Plan shall not be increased in marine sediments to that which would degrade indigenous biota.
- e. The concentration of organic materials in marine sediments shall not be increased to that which would degrade marine life.
- f. Nutrient materials shall not cause objectionable aquatic growth or degrade indigenous biota.

### **4. Biological Characteristics**

- a. Marine communities, including vertebrate, and plant species, shall not be degraded.
- b. The natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption shall not be altered.
- c. The concentration of organic materials in fish, shellfish, or other marine resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.

### **5. Radioactivity**

- a. Discharge of radioactive waste shall not degrade marine life.
- b. Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life; or result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.

### **6. General Standards**

- a. The discharge shall not cause a violation of any applicable WQO or standard for receiving waters adopted by the Central Coast Water Board or State Water Board, as required by the CWA and regulations adopted thereunder.

- b. Waste management systems that discharge to the ocean must be designed and operated in a manner that will maintain the indigenous marine life and a healthy and diverse marine community.
- c. Waste effluents shall be discharged in a manner that provides sufficient initial dilution to minimize the concentrations of substances not removed in the treatment.

**B. Groundwater Limitations – Not Applicable**

**V. PROVISIONS**

**A. Standard Provisions**

- 1. **Federal Standard Provisions.** The Discharger shall comply with all Standard Provisions included in Attachment D of this Order.
- 2. **Central Coast Water Board Standard Provisions.** The Discharger shall comply with the Central Coast Water Board Standard Provisions included in Attachment D of this Order.

**B. Monitoring and Reporting Program (MRP) Requirements**

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E of this Order. All monitoring shall be conducted according to 40 C.F.R. 136, *Guidelines Establishing Test Procedures for Analysis of Pollutants*.

**C. Special Provisions**

**1. Reopener Provisions**

- a. This Order may be reopened and modified in accordance with NPDES regulations at 40 C.F.R. 122 and 124, as necessary, to include additional conditions or limitations based on newly available information or to implement any U.S. EPA approved, new, State WQO.
- b. This Order may be reopened for modification to include an effluent limitation if monitoring establishes that the discharge causes, has the reasonable potential to cause, or contributes to an excursion above a California Ocean Plan (Ocean Plan) Table 1 water quality objective.

**2. Special Studies, Technical Reports and Additional Monitoring Requirements**

**a. Toxicity Reduction Requirements**

As indicated in section V.C of the MRP, when chronic toxicity is detected in the effluent above the applicable effluent limitations, the Discharger shall resample immediately, retest, and report the results to the Executive Officer, who will determine whether to initiate an enforcement action, require a Toxicity Reduction Evaluation (TRE) in accordance with the Discharger's TRE Workplan, or implement other measures.

A TRE is a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first step of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases – characterization, identification, and confirmation using aquatic organism's toxicity tests. The TRE shall include all reasonable steps to identify the source of toxicity. The Discharger shall take all reasonable steps to reduce toxicity to the required level once the source of toxicity is identified.

The Discharger shall maintain a TRE Workplan, which describes steps that the Discharger intends to follow in the event that a toxicity effluent limitation established by this Order is exceeded in the discharge. The workplan shall be prepared in accordance with current technical guidance and reference material, including:

- i. *Toxicity Reduction Evaluation Guidance for Municipal Wastewater Treatment Plants (EPA/833/B-99-022).*
- ii. *Toxicity Identification Evaluation, Phase I (EPA/600/6-91/005F).*
- iii. *Methods for Aquatic Toxicity Identification Evaluations, Phase II (EPA/600/R-92/080).*
- iv. *Methods for Aquatic Toxicity Identification Evaluations, Phase III (EPA/600/R-92/081).*

At a minimum, the TRE Workplan shall include:

- i. Actions that will be taken to investigate/identify the causes/sources of toxicity,
- ii. Actions that will be evaluated to mitigate the impact of the discharge, to correct the non-compliance, and/or to prevent the recurrence of chronic toxicity (this list of action steps may be expanded, if a TRE is undertaken), and
- iii. A schedule under which these actions will be implemented.

When monitoring measures chronic toxicity above the toxicity trigger of 134 TUc established by this Order, the Discharger shall resample immediately, and retest for chronic toxicity. Results of an initial failed test and results of subsequent monitoring shall be reported to the Executive Officer as soon as possible following receipt of monitoring results, not to exceed 15 days from the conclusion of each test. The Executive Officer will determine whether to initiate enforcement action, whether to require the Discharger to implement a TRE, or to implement other measures. When the Executive Officer requires the Discharger to conduct a TRE, the TRE shall be conducted giving due consideration to guidance provided by the U.S. EPA's Toxicity Reduction Evaluation Procedures, Phases 1, 2, and 3 (EPA document Nos. EPA 600/R-91/003, 600/6/91/005F, and 600/R-92/080, and 600/R-92/081, respectively). A TRE, if necessary, shall be conducted in accordance with the following schedule.

**Table 8. Toxicity Reduction Evaluation Schedule**

| Action Step                                                                                                         | When Required                                                                                       |
|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Take all reasonable measures necessary to immediately reduce toxicity, where the source is known.                   | Within 24 hours of identification of noncompliance.                                                 |
| Initiate the TRE in accordance to the Workplan.                                                                     | Within 7 days of notification by the Executive Officer.                                             |
| Conduct the TRE following the procedures in the Workplan.                                                           | Within the period specified in the Workplan (not to exceed one year, without an approved Workplan). |
| Submit the results of the TRE, including summary of findings, required corrective action, and all results and data. | Within 60 days of completion of the TRE.                                                            |
| Implement corrective actions to meet Permit limits and conditions.                                                  | To be determined by the Executive Officer.                                                          |

**b. Receiving Water Monitoring for Bacteria**

If effluent limitations for total coliform bacteria are exceeded in consecutive monitoring events, the Discharger shall conduct near shore and surf zone monitoring for bacteria in accordance with section VIII.A of the Monitoring and Reporting Program. Results of the increased monitoring for bacteria shall be summarized and submitted in a report to the Executive Officer.

**3. Best Management Practices and Pollution Prevention**

**a. Pollution Prevention Program**

The Discharger shall continue to implement a pollution prevention program (approved by the Central Coast Water Board) to prevent the introduction of incompatible pollutants into the Facility. At a minimum, the program shall include:

- i. Inventory all chemicals used for the operation and maintenance of the treatment plant that may enter the discharge and classify each according to its potential to cause toxicity to be present in the effluent. If toxicity data is not available for the chemicals used at the plant, and toxicity is found to be present in the effluent, the Discharger should conduct toxicity tests for the individual chemicals that potentially contribute to toxicity.
- ii. Develop and implement a public educational program targeted at residential and commercial sources of toxic pollutants emphasizing the need to properly manage and minimize the disposal (i.e., source reduction) of potentially harmful pollutants (oil, antifreeze, herbicides, paints, solvents, etc.).
- iii. Develop and implement program(s) which provide convenient means for people to properly dispose of (and/or recycle) oil, antifreeze, pesticides, herbicides, paints, solvents, and other potentially harmful chemicals.
- iv. Develop and implement waste minimization measures to reduce or eliminate incompatible pollutants discharged to the treatment plant. Waste minimization measures must address all significant controllable sources of pollutants including residential, industrial, and commercial sources.

- v. On an annual basis, to be submitted with the annual report specified in the MRP, the Discharger shall submit a status report to U.S. EPA and Central Coast Water Board detailing efforts of compliance with regard to the Pollution Prevention Program specified herein.
- vi. In order to provide adequate legal authority for the Discharger to protect its Facility and to evaluate sources of industrial discharges, the Discharger must perform the following activities:
  - (a) Develop and implement a sewer use ordinance to provide the legal authorities described in 40 C.F.R. 403.8(f)(1).
  - (b) Update annually (and summarized in the annual report) industrial waste survey as described in 40 C.F.R. 403.8(f)(2)(i)-(ii).
  - (c) Update annually (and summarized in the annual report) potential impacts of industrial discharges, identified in section V.C.3.a.ii above, upon the POTW. The report must address the need for regulation of industrial discharges to implement the objectives of the pollution prevention program.
  - (d) If, in the evaluation of section V.C.3.a.i and section V.C.3.a.ii, above, the Executive Officer determines that a formal pretreatment program is necessary to adequately meet program objectives, then the Discharger shall develop such a program in accordance with 40 C.F.R. 403.9.
  - (e) The Discharger shall comply, and ensure affected indirect Dischargers comply, with the Reporting Requirements of the Standard Provisions.

**b. Pollutant Minimization Program (PMP)**

i. Pollutant Minimization Program Goal

The goal of the PMP is to reduce all potential sources of a pollutant through pollutant minimization (control) strategies, including pollution prevention measures, in order to maintain the effluent concentration at or below the effluent limitation.

Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The completion and implementation of a PMP, required in accordance with CA Water Code section 13263.3(d) will fulfill the PMP requirements in this section.

ii. Determining the Need for a PMP

- (a) The Discharger shall develop and conduct a PMP if all of the following conditions are true:

- (1) The calculated effluent limitation is less than the reported Minimum Level (ML);

- (2) The concentration of the pollutant is reported as DNQ; and,
  - (3) There is evidence showing that the pollutant is present in the effluent above the calculated effluent limitation. Such evidence may include: health advisories for fish consumption; presence of whole effluent toxicity; results of benthic or aquatic organism tissue sampling; sample results from analytical methods more sensitive than methods included in the permit; and the concentration of the pollutant is reported as DNQ and the effluent limitation is less than the MDL.
- (b) Alternatively, the Discharger must develop and conduct a PMP if all of the following conditions are true:
- (1) The calculated effluent limitation is less than the Method Detection Limit (MDL);
  - (2) The concentration of the pollutant is reported as ND; and,
  - (3) There is evidence showing that the pollutant is present in the effluent above the calculated effluent limitation. Such evidence may include: health advisories for fish consumption; presence of whole effluent toxicity; results of benthic or aquatic organism tissue sampling; sample results from analytical methods more sensitive than methods included in the permit; and the concentration of the pollutant is reported as DNQ and the effluent limitation is less than the MDL.

iii. Elements of a PMP

The Regional Board may consider cost-effectiveness when establishing the requirements of a PMP. The program shall include actions and submittals acceptable to the Central Coast Water Board including, but not limited to, the following:

- (a) An annual review and semi-annual monitoring of potential sources of the reportable pollutant, which may include fish tissue monitoring and other bio-uptake sampling;
- (b) Quarterly monitoring for the reportable pollutant in the influent to the wastewater treatment system;
- (c) Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable pollutant in the effluent at or below the calculated effluent limitation;
- (d) Implementation of appropriate cost-effective control measures for the pollutant, consistent with the control strategy; and,
- (e) An annual status report that shall be sent to the Executive Officer that includes:
  - (1) All PMP monitoring results for the previous year;

- (2) A list of potential sources of the reportable pollutant;
- (3) A summary of all action taken in accordance with the control strategy; and,
- (4) A description of actions to be taken in the following year.

**4. Construction, Operation and Maintenance Specifications**

- a. The Facility shall be operated as specified under Standard Provision D of Attachment D.

**5. Special Provisions for Municipal Facilities (POTWs Only)**

**a. Biosolids Management**

- i. The handling, management, and disposal of sludge and solids derived from wastewater treatment must comply with applicable provisions of U.S. EPA regulations at 40 C.F.R. 257, 258, 501, and 503, including all monitoring, record keeping, and reporting requirements.
- ii. Sludge and wastewater solids must be disposed of in a municipal solid waste landfill, reused by land application, or disposed of in a sludge-only landfill in accordance with 40 C.F.R. 258 and 503 and Title 23, Chapter 15 of the CCR. If the Discharger desires to dispose of solids and/or sludge in a different manner, a request for permit modification must be submitted to the U.S. EPA and to the Central Coast Water Board at least 180 days prior to beginning the alternative means of disposal.
- iii. Sludge that is disposed of in a municipal solid waste landfill must meet the requirements of 40 C.F.R. Part 258 pertaining to providing information to the public. In the annual self-monitoring report, the Discharger shall include the amount of sludge placed in the landfill as well as the landfill to which is was sent.
- iv. All requirements of 40 C.F. R. Part 503 and 23 CCR Chapter 15 are enforceable whether or not the requirements of those regulations are stated in an NPDES permit or any other permit issued to the Discharger.
- v. The Discharger shall take all reasonable steps to prevent and minimize any sludge use or disposal in violation of this Order that has a likelihood of adversely affecting human health or the environment.
- vi. Solids and sludge treatment, storage, and disposal or reuse shall not create a nuisance, such as objectionable odors or flies, and shall not result in ground water contamination.
- vii. The solids and sludge treatment and storage site shall have adequate facilities to divert surface water runoff from adjacent areas to protect the boundaries of the site from erosion, and to prevent drainage from the treatment and storage site. Adequate protection is defined as protection, at the minimum, from a 100-year storm and protection from the highest possible tidal stage that may occur.

- viii. The discharge of sewage sludge and solids shall not cause waste material to be in position where it is, or can be, conveyed from the treatment and storage sites and deposited in waters of the State.
- ix. The Discharger shall submit an annual report to the U.S. EPA and the Central Coast Water Board containing monitoring results and pathogen and vector attraction reduction requirements, as specified by 40 C.F.R. Part 503. The Discharger shall also report the quantity of sludge removed from the Facility and the disposal method. This self-monitoring report shall be submitted by February 19 of each year and report for the period of the previous calendar year.

## 6. Other Special Provisions

- a. **Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (State Water Board Order No. 2006-0003-DWQ).** This General Permit, adopted on May 2, 2006, is applicable to all “federal and State agencies, municipalities, counties, districts, and other public entities that own or operate sanitary sewer systems greater than one mile in length that collect and/or convey untreated or partially treated wastewater to a publically owned treatment facility in the State of California.” The purpose of the General Permit is to promote the proper and efficient management, operation, and maintenance of sanitary sewer systems and to minimize the occurrences and impacts of sanitary sewer overflows. The Dischargers enrolled separately under the General WDR. The City of Morro Bay received enrollment status on January 8, 2007, and Cayucos Sanitary District received enrollment status on January 9, 2007.
- b. **Loss of Disinfection.** As soon as possible after learning of a significant loss of disinfection, the Discharger shall notify the California Department of Public Health’s Preharvest Shellfish Protection and Marine Biotoxin Monitoring Program (510-412-4638), the San Luis Obispo Public Health Services (805-781-5553), the Central Coast Water Board (805-549-3147), and any shellfish leaseholders with active shellfish growing operations in the area of the discharge, as set forth in a list to be obtained from DHS, and regularly updated. The Discharger shall determine at its discretion if a loss of disinfection has occurred, and provide notification by fax within four hours of an occurrence during weekday hours of 6:00 AM to 5:00 PM. Notification shall be given by 10:00 AM on the following business day, if a loss of disinfection has occurred, the Discharger shall also conduct monitoring for bacteria in the receiving water in accordance with section VIII.A of the MRP.

## VI. COMPLIANCE DETERMINATION

### A. General

Compliance with effluent limitations for reportable pollutants shall be determined using sample reporting protocols defined in the MRP and Attachment A of this Order. For purposes of reporting and administrative enforcement by the Central Coast and State Water Boards, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the reportable pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reported Minimum Level (ML).

**B. Multiple Sample Data**

When determining compliance with a measure of central tendency (arithmetic mean, geometric mean, median, etc.) of multiple samples analyses and the data set contains one or more reported determinations of “Detected, but Not Quantified” (“DNQ”, or “Not Detected” (ND), the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

**C. Average Monthly Effluent Limitation (AMEL)**

If the average of daily discharges over a calendar month exceeds the AMEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month). The average of daily discharges over the calendar month that exceeds the AMEL for a parameter will be considered out of compliance for that month only. If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for that calendar month. For any one calendar month during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar month.

**D. Average Weekly Effluent Limitation (AWEL)**

If the average of daily discharges over a calendar week exceeds the AWEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that week for that parameter, resulting in 7 days of non-compliance. The average of daily discharges over the calendar week that exceeds the AWEL for a parameter will be considered out of compliance for that week only. If only a single sample is taken during the calendar week and the analytical result for that sample exceeds the AWEL, the Discharger will be considered out of compliance for that calendar week. For any one calendar week during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar week.

**E. Maximum Daily Effluent Limitation (MDEL)**

If a daily discharge exceeds the MDEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for that parameter for that 1 day only within the reporting period. For any 1 day during which no sample is taken, no compliance determination can be made for that day.

## ATTACHMENT A – DEFINITIONS

### Acute Toxicity

- a. Acute Toxicity (TUa)  
Expressed in Toxic Units Acute (TUa)

$$TUa = \frac{100}{96\text{-hr LC } 50\%}$$

- b. Lethal Concentration 50% (LC 50)

LC 50 (percent waste giving 50% survival of test organisms) shall be determined by static or continuous flow bioassay techniques using standard marine test species as specified in Ocean Plan Appendix III. If specific identifiable substances in wastewater can be demonstrated by the discharger as being rapidly rendered harmless upon discharge to the marine environment, but not as a result of dilution, the LC 50 may be determined after the test samples are adjusted to remove the influence of those substances.

When it is not possible to measure the 96-hour LC 50 due to greater than 50 percent survival of the test species in 100 percent waste, the toxicity concentration shall be calculated by the expression:

$$TUa = \frac{\log(100 - S)}{1.7}$$

where:

S = percentage survival in 100% waste. If S > 99, TUa shall be reported as zero.

### Areas of Special Biological Significance (ASBS)

Those areas designated by the State Water Board as ocean areas requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable. All Areas of Special Biological Significance are also classified as a subset of STATE WATER QUALITY PROTECTION AREAS.

### Average Monthly Effluent Limitation (AMEL)

The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

### Average Weekly Effluent Limitation (AWEL)

The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

### Chlordane

Shall mean the sum of chlordane-alpha, chlordane-gamma, chlordene-alpha, chlordene-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.

**Chronic Toxicity**

This parameter shall be used to measure the acceptability of waters for supporting a healthy marine biota until improved methods are developed to evaluate biological response.

a. Chronic Toxicity (TUc)

Expressed as Toxic Units Chronic (TUc)

$$TUc = \frac{100}{NOEL}$$

b. No Observed Effect Level (NOEL)

The NOEL is expressed as the maximum percent effluent or receiving water that causes no observable effect on a test organism, as determined by the result of a critical life stage toxicity test listed in Ocean Plan Appendix II.

**Daily Discharge**

Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

**DDT**

Shall mean the sum of 4,4'DDT, 2,4'DDT, 4,4'DDE, 2,4'DDE, 4,4'DDD, and 2,4'DDD.

**Degrade**

Degradation shall be determined by comparison of the waste field and reference site(s) for characteristic species diversity, population density, contamination, growth anomalies, debility, or supplanting of normal species by undesirable plant and animal species. Degradation occurs if there are significant differences in any of three major biotic groups, namely, demersal fish, benthic invertebrates, or attached algae. Other groups may be evaluated where benthic species are not affected, or are not the only ones affected.

**Detected, but Not Quantified (DNQ)**

Sample results that are less than the reported Minimum Level, but greater than or equal to the laboratory's MDL. Sample results reported as DNQ are estimated concentrations.

**Dichlorobenzenes**

Shall mean the sum of 1,2- and 1,3-dichlorobenzene.

**Downstream Ocean Waters**

Waters downstream with respect to ocean currents.

**Dredged Material**

Any material excavated or dredged from the navigable waters of the United States, including material otherwise referred to as “spoil.”

**Enclosed Bays**

Indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes but is not limited to: Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

**Endosulfan**

The sum of endosulfan-alpha and -beta and endosulfan sulfate.

**Estuaries and Coastal Lagoons** are waters at the mouths of streams that serve as mixing zones for fresh and ocean waters during a major portion of the year. Mouths of streams that are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include but are not limited to the Sacramento-San Joaquin Delta as defined by section 12220 of the California Water Code, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

**Halomethanes** shall mean the sum of bromoform, bromomethane (methyl bromide) and chloromethane (methyl chloride).

**HCH** shall mean the sum of the alpha, beta, gamma (lindane) and delta isomers of hexachlorocyclohexane.

**Initial Dilution**

The process that results in the rapid and irreversible turbulent mixing of wastewater with ocean water around the point of discharge.

For a submerged buoyant discharge, characteristic of most municipal and industrial wastes that are released from the submarine outfalls, the momentum of the discharge and its initial buoyancy act together to produce turbulent mixing. Initial dilution in this case is completed when the diluting wastewater ceases to rise in the water column and first begins to spread horizontally.

For shallow water submerged discharges, surface discharges, and non-buoyant discharges, characteristic of cooling water wastes and some individual discharges, turbulent mixing results primarily from the momentum of discharge. Initial dilution, in these cases, is considered to be completed when the momentum induced velocity of the discharge ceases to produce significant mixing of the waste, or the diluting plume reaches a fixed distance from the discharge to be specified by the Regional Board, whichever results in the lower estimate for initial dilution.

**Instantaneous Maximum Effluent Limitation**

The highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

**Instantaneous Minimum Effluent Limitation**

The lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

**Kelp Beds**

For purposes of the bacteriological standards of the Ocean Plan, are significant aggregations of marine algae of the genera Macrocystis and Nereocystis. Kelp beds include the total foliage canopy of Macrocystis and Nereocystis plants throughout the water column.

**Mariculture**

The culture of plants and animals in marine waters independent of any pollution source.

**Material**

(a) In common usage: (1) the substance or substances of which a thing is made or composed (2) substantial; (b) For purposes of the Ocean Plan relating to waste disposal, dredging and the disposal of dredged material and fill, MATERIAL means matter of any kind or description which is subject to regulation as waste, or any material dredged from the navigable waters of the United States. See also, DREDGED MATERIAL.

**Maximum Daily Effluent Limitation (MDEL)**

The highest allowable daily discharge of a pollutant.

**Method Detection Limit (MDL)**

The minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 C.F.R. part 136, Attachment B.

**Minimum Level (ML)**

The concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

**Natural Light**

Reduction of natural light may be determined by the Central Coast Water Board by measurement of light transmissivity or total irradiance, or both, according to the monitoring needs of the Central Coast Water Board.

**Not Detected (ND)**

Those sample results less than the laboratory's MDL.

**Ocean Waters**

The territorial marine waters of the state as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. If a discharge outside the territorial waters of the state could affect the quality of the waters of the state, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters.

**PAHs (polynuclear aromatic hydrocarbons)**

The sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,12-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[ah]anthracene, fluorene, indeno[1,2,3-cd]pyrene, phenanthrene and pyrene.

**PCBs (polychlorinated biphenyls)**

The sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254 and Aroclor-1260.

**Pollutant Minimization Program (PMP)**

PMP means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce all potential sources of Ocean Plan Table 1 pollutants through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Central Coast Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

**Reported Minimum Level**

The reported ML (also known as the Reporting Level or RL) is the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Central Coast Water Board either from Appendix II of the Ocean Plan in accordance with section III.C.5.a. of the Ocean Plan or established in accordance with section III.C.5.b. of the Ocean Plan. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the reported ML.

**Shellfish**

Organisms identified by the California Department of Health Services as shellfish for public health purposes (i.e., mussels, clams and oysters).

**Significant Difference**

Defined as a statistically significant difference in the means of two distributions of sampling results at the 95 percent confidence level.

**Six-Month Median Effluent Limitation**

The highest allowable moving median of all daily discharges for any 180-day period.

**State Water Quality Protection Areas (SWQPAs)**

Non-terrestrial marine or estuarine areas designated to protect marine species or biological communities from an undesirable alteration in natural water quality. All AREAS OF SPECIAL BIOLOGICAL SIGNIFICANCE (ASBS) that were previously designated by the State Water Board in Resolution Nos. 74-28, 74-32, and 75-61 are now also classified as a subset of State Water Quality Protection Areas and require special protections afforded by the Ocean Plan.

**TCDD Equivalents**

The sum of the concentrations of chlorinated dibenzodioxins (2,3,7,8-CDDs) and chlorinated dibenzofurans (2,3,7,8-CDFs) multiplied by their respective toxicity factors, as shown in the table below.

| Isomer Group        | Toxicity Equivalence Factor |
|---------------------|-----------------------------|
|                     | 1.0                         |
| 2,3,7,8-tetra CDD   |                             |
| 2,3,7,8-penta CDD   | 0.5                         |
| 2,3,7,8-hexa CDDs   | 0.1                         |
| 2,3,7,8-hepta CDD   | 0.01                        |
| octa CDD            | 0.001                       |
|                     |                             |
| 2,3,7,8 tetra CDF   | 0.1                         |
| 1,2,3,7,8 penta CDF | 0.05                        |

**Toxicity Reduction Evaluation (TRE)**

A study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

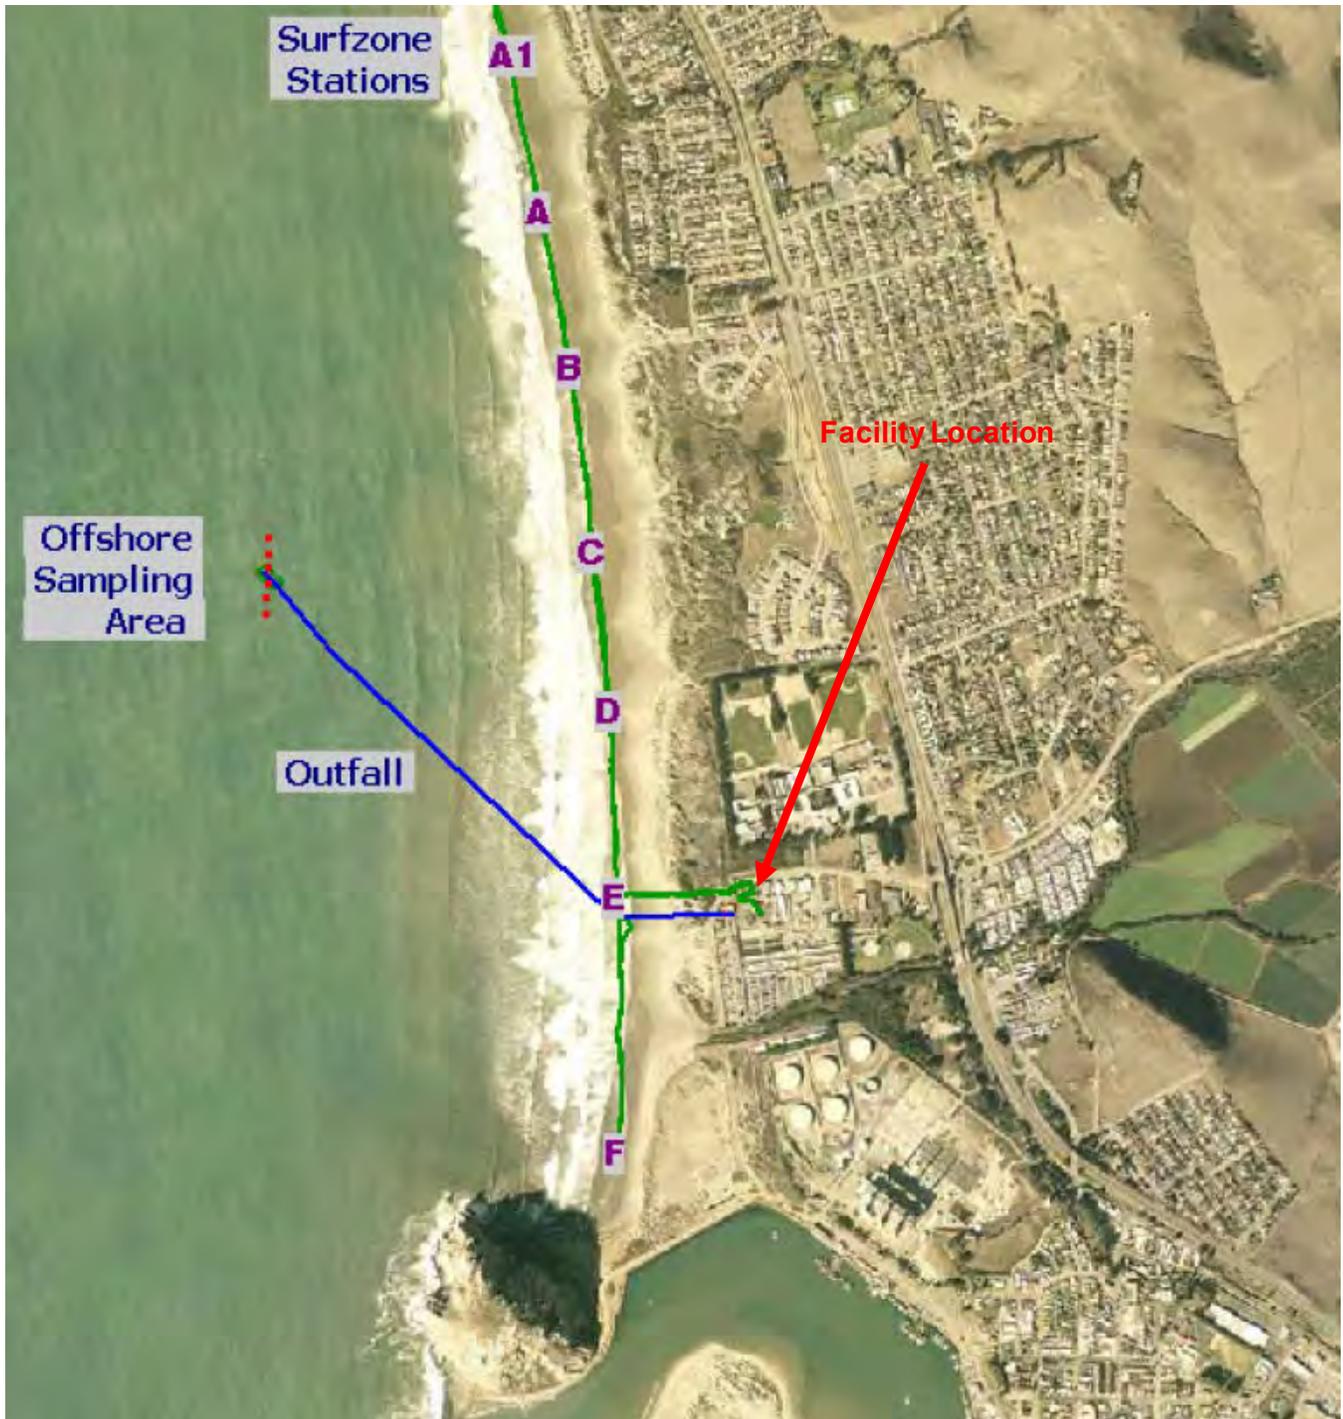

**Waste**

As used in the Ocean Plan, waste includes a Discharger’s total discharge, of whatever origin, i.e., gross, not net, discharge.

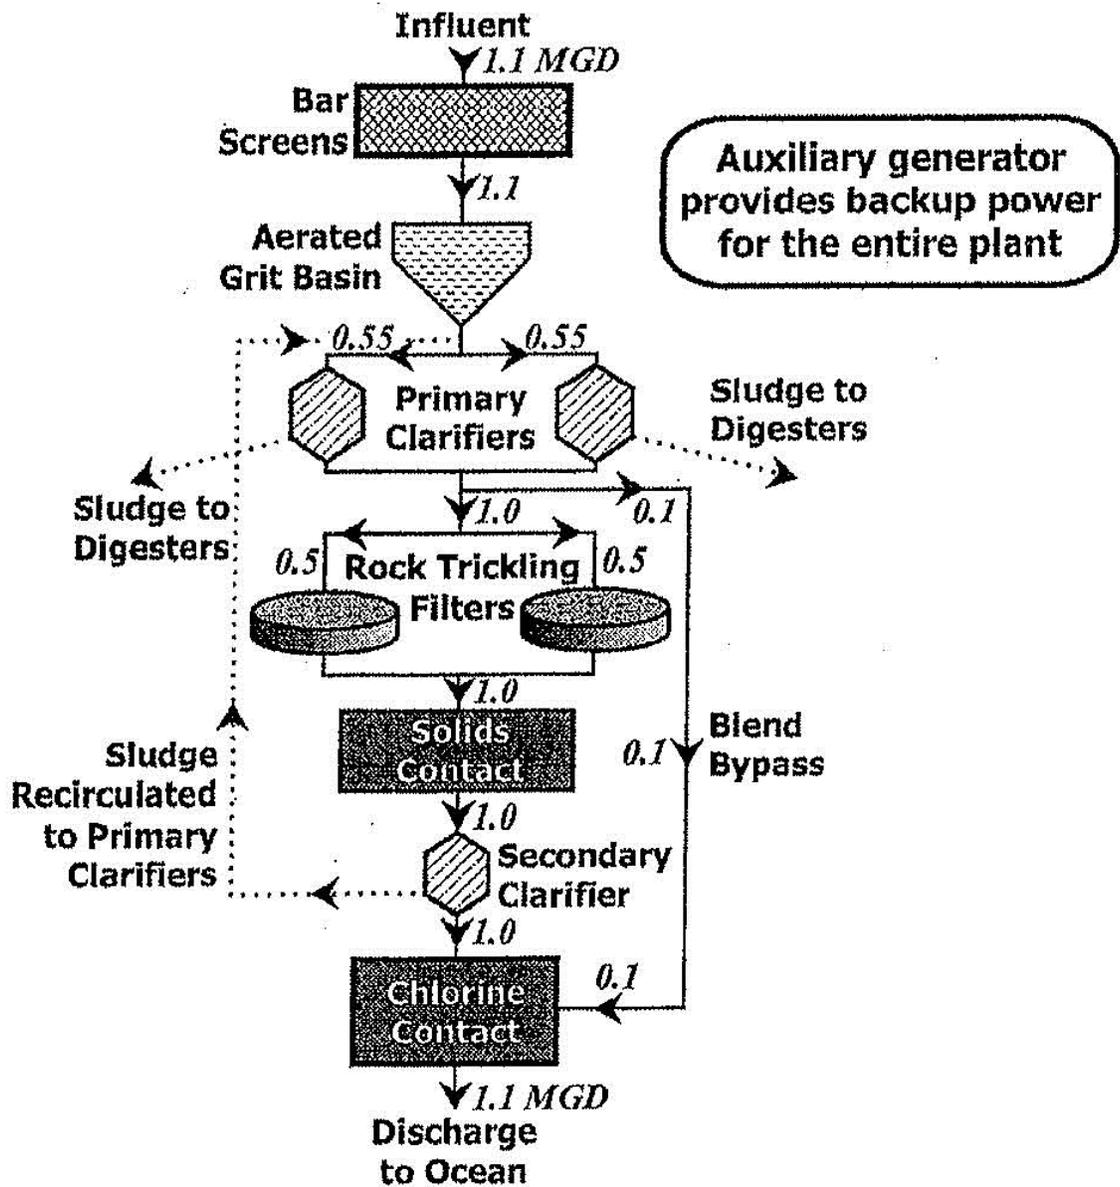

**Water Recycling**

The treatment of wastewater to render it suitable for reuse, the transportation of treated wastewater to the place of use, and the actual use of treated wastewater for a direct beneficial use or controlled use that would not otherwise occur.

ATTACHMENT B – MAP

ATTACHMENT C – FLOW SCHEMATIC

## ATTACHMENT D – STANDARD PROVISIONS

### I. STANDARD PROVISIONS – PERMIT COMPLIANCE

#### A. Duty to Comply

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 C.F.R. § 122.41(a).)
2. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

#### B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

#### C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

#### D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

#### E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)
2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

## **F. Inspection and Entry**

The Discharger shall allow the Central Coast Water Board, State Water Board, U.S. EPA, and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 C.F.R. § 122.41(i); Wat. Code, § 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (40 C.F.R. § 122.41(i)(1));
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (40 C.F.R. § 122.41(i)(2));
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (40 C.F.R. § 122.41(i)(3)); and
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 C.F.R. § 122.41(i)(4).)

## **G. Bypass**

1. Definitions
  - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)
2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)
3. Prohibition of bypass. Bypass is prohibited, and the Central Coast Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering

- d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

## II. STANDARD PROVISIONS – PERMIT ACTION

### A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

### B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

### C. Transfers

This Order is not transferable to any person except after notice to the Central Coast Water Board. The Central Coast Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. § 122.41(l)(3); § 122.61.)

## III. STANDARD PROVISIONS – MONITORING

- A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)
- B. Monitoring results must be conducted according to test procedures under 40 C.F.R. part 136 or, in the case of sludge use or disposal, approved under 40 C.F.R. part 136 unless otherwise specified in 40 C.F.R. part 503 unless other test procedures have been specified in this Order. (40 C.F.R. § 122.41(j)(4); § 122.44(i)(1)(iv).)

## IV. STANDARD PROVISIONS – RECORDS

- A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 C.F.R. part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Central Coast Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

**B. Records of monitoring information shall include:**

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));
2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));
3. The date(s) analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));
4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));
5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and
6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

**C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):**

1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and
2. Permit applications and attachments, permits and effluent data. (40 C.F.R. § 122.7(b)(2).)

**V. STANDARD PROVISIONS – REPORTING**

**A. Duty to Provide Information**

The Discharger shall furnish to the Central Coast Water Board State Water Board, or U.S. EPA within a reasonable time, any information which the Central Coast Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Central Coast Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, § 13267.)

**B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the Central Coast Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 C.F.R. § 122.41(k).)
2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA). (40 C.F.R. § 122.22(a)(3).)
3. All reports required by this Order and other information requested by the Central Coast Water Board, State Water Board, or U.S. EPA shall be signed by a person described in

Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

- a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));
  - b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and
  - c. The written authorization is submitted to the Central Coast Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)
4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Central Coast Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)
  5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.” (40 C.F.R. § 122.22(d).)

### **C. Monitoring Reports**

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 C.F.R. § 122.41(l)(4).)
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Central Coast Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 C.F.R. § 122.41(l)(4)(i).)
3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. subchapters N or O, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Central Coast Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

#### **D. Compliance Schedules**

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

#### **E. Twenty-Four Hour Reporting**

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)
2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):
  - a. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)
  - b. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)
3. The Central Coast Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

#### **F. Planned Changes**

The Discharger shall give notice to the Central Coast Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or
2. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R. § 122.41(l)(1)(iii).)

**G. Anticipated Noncompliance**

The Discharger shall give advance notice to the Central Coast Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

**H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above. (40 C.F.R. § 122.41(l)(7).)

**I. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Central Coast Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

**VI. STANDARD PROVISIONS – ENFORCEMENT**

The Central Coast Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387.

**VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS**

**A. Publicly Owned Treatment Works (POTWs)**

All POTWs shall provide adequate notice to the Central Coast Water Board of the following (40 C.F.R. § 122.42(b)):

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to sections 301 or 306 of the CWA if it were directly discharging those pollutants (40 C.F.R. § 122.42(b)(1)); and
2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order. (40 C.F.R. § 122.42(b)(2).)
3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW. (40 C.F.R. § 122.42(b)(3).)

**VIII. CENTRAL COAST WATER BOARD STANDARD PROVISIONS**

**A. Central Coast Standard Provision – Prohibitions**

1. Introduction of “incompatible wastes” to the treatment system is prohibited.

2. Discharge of high-level radiological waste and of radiological, chemical, and biological warfare agents is prohibited.
3. Discharge of “toxic pollutants” in violation of effluent standards and prohibitions established under section 307(a) of the Clean Water Act (CWA) is prohibited.
4. Discharge of sludge, sludge digester or thickener supernatant, and sludge drying bed leachate to drainageways, surface waters, or the ocean is prohibited.
5. Introduction of pollutants into the collection, treatment, or disposal system by and “indirect discharger” that:
  3. Inhibit or disrupt the treatment process, system operation, or the eventual use or disposal of sludge; or,
  4. Flow through the system to the receiving water untreated; and,
  5. Cause or “significantly contribute” to a violation of any requirement of this Order, is prohibited.
6. Introduction of “pollutant free” wastewater to the collection, treatment, and disposal system in amounts that threaten compliance with this order is prohibited.

**B. Central Coast Standard Provision – Provisions**

1. Collection, treatment, and discharge of waste shall not create a nuisance or pollution, as defined by California Water Code (CWC) 13050.
2. All facilities used for transport or treatment of wastes shall be adequately protected from inundation and washout as the result of a 100-year frequency flood.
3. Operation of collection, treatment, and disposal systems shall be in a manner that precludes public contact with wastewater.
4. Collected screenings, sludges, and other solids removed from liquid wastes shall be disposed in a manner approved by the Executive Officer.
5. Publicly owned wastewater treatment plans shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Title 23 of the California Administrative Code.
6. After notice and opportunity for a hearing, this order may be terminated for cause, including, but not limited to:
  - a. Violation of any term or condition contained in this order;
  - b. Obtaining this order by misrepresentation, or by failure to disclose fully all relevant facts;
  - c. A change in any condition or endangerment to human health or environment that requires a temporary or permanent reduction or elimination of the authorized discharge; and,

13. Production and use of reclaimed water is subject to the approval of the Central Coast Board. Production and use of reclaimed water shall be in conformance with reclamation criteria established in Chapter 3, Title 22, of the California Administrative Code and Chapter 7, Division 7, of the CWC. An engineering report pursuant to section 60323, Title 22, of the California Administrative Code is required and a waiver or water reclamation requirements from the Central Coast Board is required before reclaimed water is supplied for any use, or to any user, not specifically identified and approved either in this Order or another order issued by this Board.

**C. Central Coast Standard Provisions – General Monitoring Requirements**

1. If results of monitoring a pollutant appear to violate effluent limitations based on a weekly, monthly, 30-day, or six-month period, but compliance or non-compliance cannot be validated because sampling is too infrequent, the frequency of sampling shall be increased to validate the test within the next monitoring period. The increased frequency shall be maintained until the Executive Officer agrees the original monitoring frequency may be resumed.

For example, if copper is monitored annually and results exceed the six-month median numerical effluent limitation in the permit, monitoring of copper must be increased to a frequency of at least once every two months (Central Coast Standard Provisions – Definitions I.G.13.). If suspended solids are monitored weekly and results exceed the weekly average numerical limit in the permit, monitoring of suspended solids must be increased to at least four (4) samples every week (Central Coast Standard Provisions – Definitions I.G.14.).

2. Water quality analyses performed in order to monitor compliance with this permit shall be by a laboratory certified by the State Department of Health Services (DHS) for the constituent(s) being analyzed. Bioassay(s) performed in order to monitor compliance with this permit shall be in accord with guidelines approved by the State Water Resources Control Board (State Water Board) and the State Department of Fish and Game. If the laboratory used or proposed for use by the discharger is not certified by the DHS or, where appropriate, the Department of Fish and Game due to restrictions in the State's laboratory certification program, the discharger shall be considered in compliance with this provision provided:
  - a. Data results remain consistent with results of samples analyzed by the Central Coast Water Board;
  - b. A quality assurance program is used at the laboratory, including a manual containing steps followed in this program that is available for inspections by the staff of the Central Coast Water Board; and,
  - c. Certification is pursued in good faith and obtained as soon as possible after the program is reinstated.
3. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. Samples shall be taken during periods of peak loading conditions.

4. All monitoring instruments and devices used by the discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy.

**D. Central Coast Standard Provisions – General Reporting Requirements**

1. Reports of marine monitoring surveys conducted to meet receiving water monitoring requirements of the Monitoring and Reporting Program shall include at least the following information:
  - a. A description of climatic and receiving water characteristics at the time of sampling (weather observations, floating debris, discoloration, wind speed and direction, swell or wave action, time of sampling, tide height, etc.).
  - b. A description of sampling stations, including differences unique to each station (e.g., station location, grain size, rocks, shell litter, calcareous worm tubes, evident life, etc.).
  - c. A description of the sampling procedures and preservation sequence used in the survey.
  - d. A description of the exact method used for laboratory analysis. In general, analysis shall be conducted according to Central Coast Standard Provisions – C.1 above, and Federal Standard Provision – Monitoring III.B. However, variations in procedure are acceptable to accommodate the special requirements of sediment analysis. All such variations must be reported with the test results.
  - e. A brief discussion of the results of the survey. The discussion shall compare data from the control station with data from the outfall stations. All tabulations and computations shall be explained.
2. Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule shall be submitted within 14 days following each scheduled date unless otherwise specified within the permit. If reporting noncompliance, the report shall include a description of the reason, a description and schedule of tasks necessary to achieve compliance, and an estimated date for achieving full compliance. A second report shall be submitted within 14 days of full compliance.
3. The “Discharger” shall file a report of waste discharge or secure a waiver from the Executive Officer at least 180 days before making any material change or proposed change in the character, location, or plume of the discharge.
4. Within 120 days after the discharger discovers, or is notified by the Central Coast Water Board, that monthly average daily flow will or may reach design capacity of waste treatment and/or disposal facilities within four (4) years, the discharger shall file a written report with the Central Coast Water Board. The report shall include:
  - a. the best estimate of when the monthly average daily dry weather flow rate will equal or exceed design capacity; and,

8. A discussion of operator certification and a list of current operating personnel and their grades of certification.
9. The date of the facility's Operation and Maintenance Manual (including contingency plans as described in Provision B.9), the date the manual was last reviewed, and whether the manual is complete and valid for the current facility.
10. A discussion of the laboratories used by the discharger to monitor compliance with effluent limits and a summary of performance relative to section C, General Monitoring Requirements.
11. If the facility treats industrial or domestic wastewater and there is no provision for periodic sludge monitoring in the Monitoring and Reporting Program, the report shall include a summary of sludge quantities, analyses of its chemical and moisture content, and its ultimate destination.
12. If appropriate, the report shall also evaluate the effectiveness of the local source control or pretreatment program using the State Water Resources Control Board's "Guidelines for Determining the Effectiveness of Local Pretreatment Program."

**E. Central Coast Standard Provisions – General Pretreatment Provisions**

1. Discharge of pollutants by "indirect dischargers" in specific industrial sub-categories (appendix C, 40 C.F.R. Part 403), where categorical pretreatment standards have been established, or are to be established, (according to 40 C.F.R. Chapter 1, Subchapter N), shall comply with the appropriate pretreatment standards:
  - a. By the date specified therein;
13. Within three (3) years of the effective date specified therein, but in no case later than July 1, 1984; or,
14. If a new indirect discharger, upon commencement of discharge

**F. Central Coast Standard Provision – Enforcement**

1. Any person failing to file a report of waste discharge or other report as required by this permit shall be subject to a civil penalty not to exceed \$5,000 per day.
2. Upon reduction, loss, or failure of the treatment facility, the "Discharger" shall, to the extent necessary to maintain compliance with this permit, control production or all discharges, or both, until the facility is restored or an alternative method of treatment is provided.

**G. Central Coast Standard Provisions – Definitions (Not otherwise included in Attachment A to this Order)**

1. A "composite sample" is a combination of no fewer than eight (8) individual samples obtained at equal time intervals (usually hourly) over the specified sampling (composite) period. The volume of each individual sample is proportional to the flow rate at the time of sampling. The period shall be specified in the Monitoring and Reporting Program ordered by the Executive Officer.

2. "Daily Maximum" limit means the maximum acceptable concentration or mass emission rate of a pollutant measured during a calendar day or during any 24-hour period reasonably representative of the calendar day for purposes of sampling. It is normally compared with results based on "composite samples" except for ammonia, total chlorine, phenolic compounds, and toxicity concentration. For all exceptions, comparisons will be made with results from a "grab sample".
3. "Discharger", as used herein, means, as appropriate: (1) the Discharger, (2) the local sewerage entity (when the collection system is not owned and operated by the Discharger), or (3) "indirect discharger" (where "Discharger" appears in the same paragraph as "indirect discharger", it refers to the discharger.)
4. "Duly Authorized Representative" is one where:
  - a. the authorization is made in writing by a person described in the signatory paragraph of Federal Standard Provision V.B.;
5. the authorization specifies either an individual or the occupant of a position having either responsibility for the overall operation of the regulated facility, such as the plant manager, or overall responsibility for environmental matters of the company; and,
6. the written authorization was submitted to the Central Coast Water Board.
7. A "grab sample" is defined as any individual sample collected in less than 15 minutes. "Grab samples" shall be collected during peak loading conditions, which may or may not be during hydraulic peaks. It is used primarily in determining compliance with the daily maximum limits identified in Central Coast Standard Provision – Provision G.2. and instantaneous maximum limits.
8. "Hazardous substance" means any substance designated under 40 C.F.R. Part 116 pursuant to section 311 of the Clean Water Act.
9. "Incompatible wastes" are:
  - a. Wastes which create a fire or explosion hazard in the treatment works;
10. Wastes which will cause corrosive structural damage to treatment works, but in no case wastes with a pH lower than 5.0 unless the works is specifically designed to accommodate such wastes;
11. Solid or viscous wastes in amounts which cause obstruction to flow in sewers, or which cause other interference with proper operation of treatment works;
12. Any waste, including oxygen demanding pollutants (BOD, etc), released in such volume or strength as to cause inhibition or disruption in the treatment works and subsequent treatment process upset and loss of treatment efficiency; and,
13. Heat in amounts that inhibit or disrupt biological activity in the treatment works or that raise influent temperatures above 40°C (104°F) unless the treatment works is designed to accommodate such heat.

14. "Indirect Discharger" means a non-domestic discharger introducing pollutants into a publicly owned treatment and disposal system.
15. "Log Mean" is the geometric mean. Used for determining compliance of fecal or total coliform populations, it is calculated with the following equation:

$$\text{Log Mean} = (C_1 \times C_2 \times \dots \times C_n)^{1/n},$$

in which "n" is the number of days samples were analyzed during the period and any "C" is the concentration of bacteria (MPN/100 ml) found on each day of sampling. "n" should be five or more.

16. "Mass emission rate" is a daily rate defined by the following equations:

$$\text{mass emission rate (lbs/day)} = 8.34 \times Q \times C; \text{ and,}$$

$$\text{mass emission rate (kg/day)} = 3.79 \times Q \times C,$$

where "C" (in mg/L) is the measured daily constituent concentration or the average of measured daily constituent concentrations and "Q" (in MGD) is the measured daily flowrate or the average of measured daily flow rates over the period of interest.

17. The "Maximum Allowable Mass Emission Rate," whether for a month, week, day, or six-month period, is a daily rate determined with the formulas in paragraph G.10, above, using the effluent concentration limit specified in the permit for the period and the average of measured daily flows (up to the allowable flow) over the period.
18. "Maximum Allowable Six-Month Median Mass Emission Rate" is a daily rate determined with the formulas in Central Coast Standard Provision – Provision G.10, above, using the "six-month Median" effluent limit specified in the permit, and the average of measured daily flows (up to the allowable flow) over a 180-day period.
19. "Median" is the value below which half the samples (ranked progressively by increasing value) fall. It may be considered the middle value, or the average of two middle values.
20. "Monthly Average" (or "Weekly Average", as the case may be) is the arithmetic mean of daily concentrations or of daily mass emission rates over the specified 30-day (or 7-day) period.  
$$\text{Average} = (X_1 + X_2 + \dots + X_n) / n$$

in which "n" is the number of days samples were analyzed during the period and "X" is either the constituent concentration (mg/l) or mass emission rate (kg/day or lbs/day) for each sampled day. "n" should be four or greater.
21. "Municipality" means a city, town, borough, county, district, association, or other public body created by or under State law and having jurisdiction over disposal of sewage, industrial waste, or other waste.

22. "Overflow" means the intentional or unintentional diversion of flow from the collection and transport systems, including pumping facilities.

23. "Pollutant-free wastewater" means inflow and infiltration, stormwaters, and cooling waters and condensates which are essentially free of pollutants.
24. "Primary Industry Category" means any industry category listed in 40 C.F.R. Part 122, Appendix A.
25. "Removal Efficiency" is the ratio of pollutants removed by the treatment unit to pollutants entering the treatment unit. Removal efficiencies of a treatment plant shall be determined using "Monthly averages" of pollutant concentrations (C, in mg/l) of influent and effluent samples collected about the same time and the following equation (or its equivalent):
- $$C_{\text{Effluent}} \text{ Removal Efficiency (\%)} = 100 \times (1 - C_{\text{Effluent}} / C_{\text{Influent}})$$
26. "Severe property damage" means substantial physical damage to property, damage to treatment facilities which causes them to become inoperable, or substantial and permanent loss to natural resources which can reasonably be expected to occur in the absence of a "bypass". It does not mean economic loss caused by delays in production.
27. "Sludge" means the solids, residues, and precipitates separated from, or created in, wastewater by the unit processes of a treatment system.
28. To "significantly contribute" to a permit violation means an "indirect discharger" must:
- a. Discharge a daily pollutant loading in excess of that allowed by contract with the "Discharger" or by Federal, State, or Local law;
15. Discharge wastewater which substantially differs in nature or constituents from its average discharge;
16. Discharge pollutants, either alone or in conjunction with discharges from other sources, which results in a permit violation or prevents sewage sludge use or disposal; or
17. Discharge pollutants, either alone or in conjunction with pollutants from other sources that increase the magnitude or duration of permit violations.
29. "Toxic Pollutant" means any pollutant listed as toxic under section 307 (a) (1) of the Clean Water Act or under 40 C.F.R. Part 122, Appendix D. Violation of maximum daily discharge limitations are subject to 24-hour reporting (Federal Standard Provisions V.E.).
30. "Zone of Initial Dilution" means the region surrounding or adjacent to the end of an outfall pipe or diffuser ports whose boundaries are defined through calculation of a plume model verified by the State Water Board

## **ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)**

The Code of Federal Regulations (40 C.F.R. § 122.48) requires that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Quality Control Board (Central Coast Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements that implement federal and California regulations.

### **I. GENERAL MONITORING PROVISIONS**

#### **A. Laboratory Certification**

Laboratories analyzing monitoring samples shall be certified by the Department of Public Health (DPH), in accordance with the provision of Water Code section 13176, and must include quality assurance/quality control data with their reports.

**B.** Samples and measurements taken as required herein shall be representative of the volume and nature of the monitored discharge. All samples shall be taken at the monitoring locations specified below and, unless otherwise specified, before the monitored flow joins or is diluted by any other waste stream, body of water, or substance. Monitoring locations shall now be changed without notification to and approval of the Central Coast Water Board.

**C.** Appropriate flow measurement devices and methods consistent with accepted scientific practices shall be selected and used to ensure the accuracy and reliability of measurements of the volume of monitored discharges. The devices shall be installed, calibrated, and maintained to ensure that the accuracy of the measurements is consistent with the accepted capability of that type of device. Devices selected shall be capable of measuring flows with a maximum deviation of less than  $\pm 10$  percent from true discharge rates throughout the range of expected discharge volumes. Guidance in selection, installation, calibration, and operation of acceptable flow measurement devices can be obtained from the following references.

1. *A Guide to Methods and Standards for the Measurement of Water Flow*, U.S. Department of Commerce, National Bureau of Standards, NBS Special Publication 421, May 1975, 96 pp. (Available from the U.S. Government Printing Office, Washington, D.C. 20402. Order by SD Catalog No. C13.10:421.)
2. *Water Measurement Manual*, U.S. Department of Interior, Bureau of Reclamation, Second Edition, Revised Reprint, 1974, 327 pp. (Available from the U.S. Government Printing Office, Washington D.C. 20402. Order by Catalog No. 172.19/2:W29/2, Stock No. S/N 24003-0027.)
3. *Flow Measurement in Open Channels and Closed Conduits*, U.S. Department of Commerce, National Bureau of Standards, NBS Special Publication 484, October 1977, 982 pp. (Available in paper copy or microfiche from National Technical Information Services (NTIS) Springfield, VA 22050. Order by NTIS No. PB-273 535/5ST.)
4. *NPDES Compliance Sampling Manual*, U.S. Environmental Protection Agency, Office of Water Enforcement, Publication MCD-51, 1977, 140 pp. (Available from the General Services Administration (8FFS), Centralized Mailing Lists Services, Building 41, Denver Federal Center, CO 80225.)

- D.** All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. All flow measurement devices shall be calibrated at least once per year to ensure continued accuracy of the devices.
- E.** Monitoring results, including noncompliance, shall be reported at intervals and in a manner specified in this MRP.
- F.** Unless otherwise specified by this MRP, all monitoring shall be conducted according to test procedures established at 40 C.F.R. 136, Guidelines Establishing Test Procedures for Analysis of Pollutants. All analyses shall be conducted using the lowest practical quantitation limit achievable using the specified methodology. Where effluent limitations are set below the lowest achievable quantitation limits, pollutants not detected at the lowest practical quantitation limits will be considered in compliance with effluent limitations. Analysis for toxic pollutants specified in Table 1 of the California Ocean Plan shall be conducted in accordance with procedures described in the California Ocean Plan and restated in this MRP.
- G.** Monitoring and sampling periods are defined as follows unless otherwise specified in this MRP:
  - Daily:** Midnight through 11:59 PM, or any 24-hour period that reasonably represents a calendar day for purposes of sampling.
  - Weekly:** Sunday through Saturday (Note: For weekly monitoring and sampling periods that start in one monthly reporting period but end in the next, the Discharger may report the weekly data in the monthly monitoring report containing the last day of the weekly period.)
  - Monthly:** 1<sup>st</sup> day of calendar month through last day of calendar month.
  - Annually:** January 1<sup>st</sup> through December 31<sup>st</sup>

**II. MONITORING LOCATIONS**

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

**Table E-1. Monitoring Station Locations**

| Discharge Point Name | Monitoring Location Name    | Monitoring Location Description (include Latitude and Longitude when available)                                                                                                      |
|----------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| --                   | INF-001<br>(formally M-INF) | Influent wastewater prior to treatment and following all significant input of wastewater to the treatment system, and upstream of Facility return flows.                             |
| 001                  | EFF-001<br>(formally M-001) | Location where representative sample of effluent, to be discharged through the ocean outfall, can be collected after treatment.<br>Latitude: 35° 22' 47" N Longitude: 120° 51' 40" W |
| --                   | RSW-001<br>(formally RW-1)  | Upcoast Midfield<br>Latitude: 35° 23' 15" N Longitude: 120° 52' 30" W                                                                                                                |
| --                   | RSW-002<br>(formally RW-2)  | Upcoast Nearfield<br>Latitude: 35° 23' 14" N Longitude: 120° 52' 30" W                                                                                                               |

| Discharge Point Name | Monitoring Location Name   | Monitoring Location Description (include Latitude and Longitude when available) |

| --                   | B-002                      | Upcoast Reference<br>Latitude: 35° 23' 17" N Longitude: 120° 52' 30" W          |
| --                   | B-003                      | Downcoast Nearfield<br>Latitude: 35° 23' 14" N Longitude: 120° 52' 30" W        |
| --                   | B-004                      | Upcoast ZID<br>Latitude: 35° 23' 13" N Longitude: 120° 52' 30" W                |
| --                   | B-005                      | Downcoast ZID<br>Latitude: 35° 23' 11" N Longitude: 120° 52' 30" W              |
| --                   | B-006                      | Downcoast Nearfield<br>Latitude: 35° 23' 10" N Longitude: 120° 52' 30" W        |
| --                   | B-007                      | Downcoast Reference<br>Latitude: 35° 23' 7" N Longitude: 120° 52' 30" W         |

The north latitude and west longitude information in Table E-1 are approximate for administrative purposes.

**III. INFLUENT MONITORING REQUIREMENTS**

**A. Monitoring Location INF-001**

1. The Discharger shall monitor influent to the Facility at INF-001 as follows:

**Table E-2. Influent Monitoring**

| Parameter                                                  | Units | Sample Type         | Minimum Sampling Frequency |
|------------------------------------------------------------|-------|---------------------|----------------------------|
| Daily Flow                                                 | MG    | Metered             | Daily                      |
| Maximum Daily Flow                                         | MGD   | Metered             | Daily                      |
| Mean Daily Flow                                            | MGD   | Calculated          | Monthly                    |
| Biochemical Oxygen Demand 5-day @ 20°C (BOD <sub>5</sub> ) | mg/L  | C-24 <sup>[1]</sup> | Weekly                     |
| Total Suspended Solids (TSS)                               | mg/L  | C-24 <sup>[1]</sup> | Weekly                     |

**Footnotes to Table E-2:**

**Units:**

mg/L = milligrams per liter

C-24 = 24 hour composite

<sup>[1]</sup> Composite samples may be taken by a proportional sampling devise approved by the Executive Officer or by grab samples composited in proportion to flow. In compositing grab samples, the sampling interval shall not exceed one hour.

2. Effluent flow metering shall be reported in place of influent flow metering when the flume is surcharged. Monitoring reports shall indicate the dates and times for which the influent flow meter was surcharged and effluent flow is being reported in place of influent flow.

**IV. EFFLUENT MONITORING REQUIREMENTS**

**A. Monitoring Location EFF-001**

1. The Discharger shall monitor effluent at Monitoring Location EFF-001, as follows.

**Table E-3. Effluent Monitoring**

| Parameter                            | Units          | Sample Type | Minimum Sampling Frequency |
|--------------------------------------|----------------|-------------|----------------------------|
| Total Chlorine Residual              | µg/L           | Grab        | 1/Day                      |
| Chlorine Usage                       | lbs/day        | Recorded    | 1/Day                      |
| Total Coliform                       | MPN            | Grab        | 5/Week <sup>[1]</sup>      |
| Temperature                          | °C             | Grab        | 5/Week                     |
| Turbidity                            | NTU            | Grab        | 5/Week                     |
| BOD <sub>5</sub>                     | mg/L           | C-24        | 1/Week                     |
| TSS                                  | mg/L           | C-24        | 1/Week                     |
| pH                                   | standard units | Grab        | 1/Week                     |
| Settleable Solids                    | mL/L           | Grab        | 1/Week                     |
| Oil and Grease                       | mg/L           | Grab        | 1/Week                     |
| Chronic Toxicity                     | TUc            | C-24        | 1/Year                     |
| Ammonia (as N)                       | mg/L           | Grab        | 1/Year                     |
| Nitrate (as N)                       | mg/L           | Grab        | 1/Year                     |
| Urea (as N)                          | mg/L           | Grab        | 1/Year                     |
| Orthophosphate (as P)                | mg/L           | Grab        | 1/Year                     |
| Dissolved Silica (SiO <sub>2</sub> ) | mg/L           | Grab        | 1/Year                     |

| Parameter                                          | Units | Sample Type | Minimum Sampling Frequency |
|----------------------------------------------------|-------|-------------|----------------------------|
| <b>Protection of Marine Aquatic Life</b>           |       |             |                            |
| Arsenic, Total Recoverable                         | µg/L  | C-24        | 1/Year                     |
| Cadmium, Total Recoverable                         | µg/L  | C-24        | 1/Year                     |
| Chromium (VI), Total Recoverable                   | µg/L  | C-24        | 1/Year                     |

| PCBs <sup>[9]</sup>                             | µg/L  | C-24        | 1/Permit                   |
| TCDD Equivalents <sup>[10]</sup>                | µg/L  | C-24        | 1/Permit                   |
| 1,1,2,2-tetrachloroethane                       | µg/L  | C-24        | 1/Permit                   |
| Tetrachloroethylene                             | µg/L  | C-24        | 1/Permit                   |
| Toxaphene                                       | µg/L  | C-24        | 1/Permit                   |

[1] If effluent limitations are exceeded for total coliform, the Discharger shall monitor as specified in section VIII.A.1 of this MRP.

[2] Endosulfan shall mean the sum of endosulfan-alpha and -beta and endosulfan sulfate.

[3] HCH shall mean the sum of alpha, beta, gamma (Lindane) and delta isomers of hexachlorocyclohexane.

[4] Dichlorobenzenes shall mean the sum of 1,2- and 1,3-dichlorobenzene.

- [5] Chlorodane shall mean the sum of chlordane-alpha, chlordane-gamma, chlordene-alpha, chlordane-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.
- [6] DDT shall mean the sum of 4,4'DDT; 2,4'DDT; 4,4"DDE; 4,4"DDD; and 2,4'DDD.
- [7] Halomethanes shall mean the sum of bromoform, bromomethane and chloromethane.
- [8] PAHs shall mean the sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,1,2-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[a,h]anthracene, fluorine, ideno[1,2,3-cd]pyrene, phenanthrene, and pyrene.
- [9] Sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.
- [10] TCDD equivalents shall mean the sum of the concentrations of chlorinated dibenzodioxins (2,3,7,8-CDDs) and chlorinated dibenzofurans (2,3,7,8-CDFs) multiplied by their respective toxicity factors, as shown below:

| Isomer Group      | Toxicity Equivalent Factor | Isomer Group        | Toxicity Equivalent Factor |
|-------------------|----------------------------|---------------------|----------------------------|
| 2,3,7,8-tetra CDD | 1.0                        | 1,2,3,7,8-penta CDF | 0.05                       |
| 2,3,7,8-penta CDD | 0.5                        | 2,3,4,7,8-penta CDF | 0.5                        |
| 2,3,7,8-hexa CDDs | 0.1                        | 2,3,7,8-hexa CDFs   | 0.1                        |
| 2,3,7,8-hepta CDD | 0.01                       | 2,3,7,8-hepta CDFs  | 0.01                       |
| octa CDD          | 0.001                      | octa CDF            | 0.001                      |
| 2,3,7,8-tetra CDF | 0.1                        | --                  | --                         |

**B. Mass Emission Goals**

1. The Discharger shall report the mass emission rates for all constituents that have mass emission effluent goals listed below, and the flow used to calculate the mass emission rates for each constituent. Annual mass emissions will be compared to performance based mass emission goals. For compounds with detectable concentrations, exceedances of performance-based mass emission goals shall be considered indicative of a statistically significant increase in loading and will trigger an antidegradation analysis prior to any future permit renewals.

**Table E-4. Mass Emission Goals**

| Constituent                             | Value | Units |
|-----------------------------------------|-------|-------|
| <b><i>Protection of Marine Life</i></b> |       |       |
| Arsenic, Total Recoverable              | 17    | kg/yr |
| Cadmium, Total Recoverable              | 88    | kg/yr |
| Chromium, Total Recoverable             | 93    | kg/yr |
| Copper, Total Recoverable               | 690   | kg/yr |
| Lead, Total Recoverable                 | 465   | kg/yr |
| Mercury, Total Recoverable              | 1.4   | kg/yr |
| Nickel, Total Recoverable               | 142   | kg/yr |
| Selenium, Total Recoverable             | 65    | kg/yr |
| Silver, Total Recoverable               | 28    | kg/yr |
| Zinc, Total Recoverable                 | 244   | kg/yr |
| Cyanide, Total                          | 71    | kg/yr |
| Endosulfan <sup>[1]</sup>               | 3     | kg/yr |
| Endrin                                  | 1     | kg/yr |

| Constituent                                        | Value | Units |
|----------------------------------------------------|-------|-------|
| HCH <sup>[2]</sup>                                 | 228   | kg/yr |
| <b>Protection of Human Health - Noncarcinogens</b> |       |       |

- [1] Endosulfan shall mean the sum of endosulfan-alpha and -beta and endosulfan sulfate.
- [2] HCH shall mean the sum of alpha, beta, gamma (Lindane) and delta isomers of hexachlorocyclohexane.
- [3] Dichlorobenzenes shall mean the sum of 1,2- and 1,3-dichlorobenzene.
- [4] Chlordane shall mean the sum of chlordane-alpha, chlordane-gamma, chlordene-alpha, chlordane-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.
- [5] DDT shall mean the sum of 4,4'DDT; 2,4'DDT; 4,4"DDE; 4,4'DDD; and 2,4'DDD.
- [6] Halomethanes shall mean the sum of bromoform, bromomethane and chloromethane.
- [7] PAHs shall mean the sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,1,2-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[a,h]anthracene, fluorine, ideno[1,2,3-cd]pyrene, phenanthrene, and pyrene.
- [8] Sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.
- [9] TCDD equivalents shall mean the sum of the concentrations of chlorinated dibenzodioxins (2,3,7,8-CDDs) and chlorinated dibenzofurans (2,3,7,8-CDFs) multiplied by their respective toxicity factors, as shown below :

| Isomer Group      | Toxicity Equivalent Factor | Isomer Group        | Toxicity Equivalent Factor |
|-------------------|----------------------------|---------------------|----------------------------|
| 2,3,7,8-tetra CDD | 1.0                        | 1,2,3,7,8-penta CDF | 0.05                       |
| 2,3,7,8-penta CDD | 0.5                        | 2,3,4,7,8-penta CDF | 0.5                        |
| 2,3,7,8-hexa CDDs | 0.1                        | 2,3,7,8-hexa CDFs   | 0.1                        |
| 2,3,7,8-hepta CDD | 0.01                       | 2,3,7,8-hepta CDFs  | 0.01                       |
| octa CDD          | 0.001                      | octa CDF            | 0.001                      |
| 2,3,7,8-tetra CDF | 0.1                        | --                  | --                         |

**V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS**

**A. Whole Effluent Chronic Toxicity – Monitoring Location EFF-001**

The presence of chronic toxicity shall be estimated as specified in *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, EPA-821/600/R-95/136; *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms*, EPA-600-4-01-003; *Procedures Manual for Conducting Toxicity Tests developed by the Marine Bioassay Project*, SWRCB 1996, 96-1WQ; and/or *Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms*, EPA/600/4-87-028 or subsequent editions.

Chronic toxicity measures a sublethal effect (e.g., reduced growth or reproduction) to experimental test organisms exposed to an effluent compared to that of the control organisms.

Chronic Toxicity (TUc) = 100/NOEL

The no observed effect level (NOEL) is the maximum tested concentration in a medium which does not cause known adverse effects upon chronic exposure in the species in question (i.e., the highest effluent concentration to which organisms are exposed in a chronic test that causes no observable adverse effects on the test organism; e.g., the highest concentration of a toxicant to which the values for the observed responses are not statistically significantly different from the controls). Examples of chronic toxicity include, but are not limited to, measurements of toxicant effects on reproduction, growth, and sublethal effects that can include behavioral, physiological, and biochemical effects.

In accordance with the 2015 Ocean Plan, Appendix III, *Standard Monitoring Procedures*, the Discharger shall use the critical life stage toxicity tests specified in the table below to measure TUc. Other species or protocols will be added to the list after the State Water Board review and approval.

A minimum of three test species with approved test protocols shall be used to measure compliance with the toxicity objective. If possible, the test species shall include a fish, an invertebrate, and an aquatic plant. After a screening period of no fewer than three sampling events, monitoring can be reduced to the most sensitive species. Dilution and control water should be obtained from an unaffected area of the receiving waters. The sensitivity of the test organisms to a reference toxicant shall be determined concurrently with each bioassay test and reported with the test results.

**Table E-6. Approved Tests – Chronic Toxicity**

| Species                                                                                   | Effect                                            | Tier | Reference |
|-------------------------------------------------------------------------------------------|---------------------------------------------------|------|-----------|
| Giant Kelp, <i>Macrocystis pyrifera</i>                                                   | Percent germination; germ tube length             | 1    | a, c      |
| Red abalone, <i>Haliotis rufesens</i>                                                     | Abnormal shell development                        | 1    | a, c      |
| Oyster, <i>Crassostrea gigas</i> ; Mussels, <i>Mytilus spp.</i>                           | Abnormal shell development; percent survival      | 1    | a, c      |
| Urchin, <i>Strongylocentrotus purpuratus</i> ; Sand dollar, <i>Dendraster excentricus</i> | Percent normal development; percent fertilization | 1    | a, c      |
| Shrimp, <i>Holmesimysis costata</i>                                                       | Percent survival; growth                          | 1    | a, c      |
| Shrimp, <i>Mysidopsis bahia</i>                                                           | Percent survival; growth; fecundity               | 2    | b, d      |
| Topsmelt, <i>Atherinops affinis</i>                                                       | Larval growth rate; percent survival              | 1    | a, c      |
| Silversides, <i>Menidia beryllina</i>                                                     | Larval growth rate; percent survival              | 2    | b, d      |

[1] First tier methods are preferred for compliance monitoring. If first tier organisms are not available, the Discharger can use a second tier test method following approval by the Regional Water Board.

Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms. EPA/600/4-87/028. National Information Service, Springfield, VA.

Dilution and control waters shall be obtained from an area of the receiving waters, typically upstream, which is unaffected by the discharge. Standard dilution water can be used, if the receiving water itself exhibits toxicity or if approved by the Central Coast Water Board. If the dilution water used in testing is different from the water in which the test organisms were cultured, a second control sample using culture water shall be tested.

If the effluent to be discharged to a marine or estuarine system (e.g., salinity values in excess of 1,000 mg/L) originates from a freshwater supply, salinity of the effluent must be increased with dry ocean salts (e.g., FORTY FATHOMS®) to match salinity of the receiving water. This modified effluent shall then be tested using marine species.

## **B. Accelerated Monitoring Requirements**

1. When chronic toxicity is detected in the effluent above an effluent limitation established by this Order, and the testing meets all test acceptability criteria, the Discharger shall resample immediately and confirm the effluent toxicity. If the retest results in toxicity greater than the applicable effluent limitation, the Discharger shall initiate accelerated monitoring.
2. Accelerated monitoring frequency consists of performing six toxicity tests (one per week) in a six-week period following the first failed test result (test results exceed effluent limitation or toxicity trigger), or as otherwise instructed by the Executive Officer. Test results shall be submitted to the Central Coast Water Board within 15 days of the conclusion of each test.
3. Unless otherwise specified by the Executive Officer, if the implementation of the generic Toxicity Reduction Evaluation (TRE) work plan indicates the source of the exceedance of the toxicity trigger (for instance, a temporary plan upset), then only one additional test is necessary. If an exceedance of the toxicity effluent limitation or toxicity trigger is detected in this test, the Discharger shall continue with accelerated monitoring requirements or implement the Toxicity Identification and Toxicity Reduction Evaluations.
4. Unless otherwise specified by the Executive Officer, if none of the six accelerated tests indicates exceedances of the toxicity effluent limitation or toxicity trigger, then the Discharger may return to the normal bioassay testing frequency.

## **C. Conducting Toxicity Identification Evaluations (TIE) and Toxicity Reduction Evaluations (TRE)**

1. A TRE shall be implemented by the Discharger as specified by the Executive Officer. A TIE may be required as part of the TRE.
2. The TIE shall be conducted to identify and evaluate toxicity in accordance with procedures recommended by the United States Environmental Protection Agency (U.S. EPA) which include the following:
  - a. Toxicity Identification Evaluation: Characterization of Chronically Toxic Effluents, Phase I, (U.S. EPA, 1992a);
  - b. Methods for Aquatic Toxicity Identification Evaluations: Phase 1 Toxicity Characterization Procedures, Second Edition (U.S. EPA, 1991a);
  - c. Methods for Aquatic Toxicity Identification Evaluations: Phase II Toxicity Identification Procedures for Sampling Exhibiting Acute and Chronic Toxicity (U.S. EPA, 1993a); and
  - d. Methods for Aquatic Toxicity Identification Evaluations: Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity (U.S. EPA, 1993b).
3. As part of the TIE investigation, the Discharger shall be required to implement its TRE work plan. The Discharger shall take all reasonable steps to control toxicity once the source of the toxicity is identified. A failure to conduct required toxicity tests or a TRE within a designated period may result in the establishment of numerical effluent limitations for chronic toxicity in a permit or appropriate enforcement action. Recommended guidance in conducting a TRE includes the following:
  - a. *Toxicity Reduction Evaluation Guidance for Municipal Wastewater Treatment Plants*, August 1999, EPA/833B-99/002; and
  - b. *Clarifications Regarding Toxicity Reduction and Identification Evaluations in the National Pollutant Discharge Elimination System Program* dated May 27, 2001, U.S. EPA Office of Wastewater Management, Office of Regulatory Enforcement.

#### **D. Toxicity Reporting**

1. The Discharger shall include a full report of toxicity test results with the regular monthly monitoring report and include the following information.
  - a. Toxicity test results,
  - b. Dates of sample collection and initiation of each toxicity test, and
  - c. And/or toxicity discharge limitations (or value).
2. Toxicity test results shall be reported according to the appropriate guidance – *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, Fifth Edition, U.S. EPA Office of Water, PA821-R-02-012 (2002) or the latest edition, or EPA-821-R-02-012 (2002) or subsequent editions.
3. If the initial investigation TRE workplan is used to determine that additional (accelerated) toxicity testing is unnecessary, these results shall be submitted with the monitoring report for the month in which investigations conducted under the TRE workplan occurred.

4. Within 14 days of receipt of a chronic toxicity test result which exceeds 134 TUc, the Discharger shall provide written notification to the Executive Officer of:
  - a. Findings of the TRE of other investigation to identify the cause(s) of toxicity,
  - b. Actions the Discharger has taken/will take to mitigate the impact of the discharge and to prevent the recurrence of toxicity. When corrective actions, including TRE, have not been completed, a schedule under which corrective actions will be implemented, or the reason for not taking corrective action, if no action has been taken.

When corrective actions, including a TRE, have not been completed, a schedule under which corrective actions will be implemented, or the reason for not taking corrective action, if no action has been taken, will be completed.

**VI. LAND DISCHARGE MONITORING REQUIREMENTS – NOT APPLICABLE**

**VII. RECYCLING MONITORING REQUIREMENTS**

If reclaimed water is used, the Discharger shall comply with applicable State and local monitoring requirements regarding the production and use of reclaimed wastewater, including requirements established by the DGS at title 22, sections 60301 – 60357 of the CCR, Water Recycling Criteria.

**VIII. RECEIVING WATER MONITORING REQUIREMENTS**

**A. Surf Zone Monitoring – Monitoring Locations SRF-A1 through SRF-G, and RSW-003 and RSW-004**

1. If the total coliform limitations specified in section III.A.4 of the Order are exceeded, the Discharger shall monitor for total and fecal coliform and enterococcus bacteria in the receiving water at all surf zone monitoring locations, and at one station directly up coast (RSW-003) and one station directly down coast (RSW-004) of the point of discharge. The Discharger shall monitor these stations daily for a minimum of 7 days at indicated in Table E-7. A report summarizing the results of monitoring, and comparing the results to the Ocean Plan water quality objectives for bacteria shall be submitted to the Executive Officer with the next monitoring report to be submitted to the Central Coast Water Board.
2. In the event of a malfunction of the Discharger’s wastewater treatment facility’s disinfection process that results in a potential or actual discharge or inadequately disinfected effluent into the receiving water, the Discharger shall monitor receiving water for bacteria as indicated in Table E-7, and provide notice in accordance with requirements established by section V.C.6.b of the Order.

**Table E-7. Bacteria Monitoring Schedule**

| Parameter             | Units      | Minimum Sampling Frequency         |
|-----------------------|------------|------------------------------------|
| Total Coliform        | MPN/100 mL | 1/Day for 7 days <sup>[1][2]</sup> |
| Fecal Coliform        | MPN/100 mL | 1/Day for 7 days <sup>[1][2]</sup> |
| Enterococcus          | MPN/100 mL | 1/Day for 7 days <sup>[1][2]</sup> |
| Standard Observations | --         | 1/Day for 7 days <sup>[2][3]</sup> |

- [1] For all bacterial analyses, sample dilutions shall be performed so the range of values extends from 2 to 16,000 MPN/100 mL. The detection methods used for each analysis shall be reported with the results of the analysis. Detection methods used for total and fecal coliform shall be those presented in the most recent edition of *Standard Methods for the Examination of Water and Wastewater* or any improved method determined by the Central Coast Water Board (and approved by U.S. EPA) to be appropriate. Detection methods used for enterococcus shall be those presented in U.S. EPA publication EPA 600/4-85/076, *Test Methods for Escherichia coli and Enterococci in Water by Membrane Filter Procedure*, or an improved method determined by the Central Coast Water Board (and approved by U.S. EPA) to be appropriate.
- [2] If a single sample exceeds any of the single sample maximum receiving water limitations established in section IV.A.1.b.ii of the Order, repeat sampling at that location shall be conducted to determine the extent and persistence of the exceedance. Repeat sampling shall be conducted within 24 hours of receiving analytical results and continued until the sample result is less than the single sample maximum receiving water limitation or until the source of the high bacterial densities has been identified and positively determined to not be caused or contributed to be discharge of effluent by the Facility. When repeat sampling is required because of an exceedance of any one single sample maximum, values from all samples collected during that 30-day period will be used to determine compliance with the 30-day geometric mean receiving water limitations in section IV.A.1.a.i of the Order.
- [3] Standard observations shall include observation of wind direction and speed, weather (e.g., cloudy, sunny, rainy), the quantity of rainfall precipitated over the previous 7 day period, sea conditions, longshore currents (e.g., directions), and tidal conditions (e.g., high, slack, or low tide). Observations of water discoloration, floating oil and grease, turbidity, odor, materials of sewage origin in the water or on the beach, and temperature (°C) shall be recorded and reported.

**IX. BENTHIC MONITORING**

**A. Benthic Sediment Monitoring – Monitoring Locations B-002 through B-007**

Sediment monitoring shall be conducted once per permit term, in October 2018. Three grab samples shall be collected using a 0.1 m<sup>2</sup> Van Veen grab sampler at each benthic monitoring station. A composite of these three samples should be analyzed as follows:

**Table E-8. Benthic Sediment Monitoring**

| Parameter                 | Units                          | Minimum Frequency of Sampling/Analysis |
|---------------------------|--------------------------------|----------------------------------------|
| Sediment particle size    | Phi size (% volume)            | Once during permit term (October 2018) |
| Organic Matter            | Volatile solids or TOC (mg/kg) | Once during permit term (October 2018) |
| Biochemical Oxygen Demand | mg/L                           | Once during permit term (October 2018) |
| Total Kjeldahl Nitrogen   | mg/L                           | Once during permit term (October 2018) |
| Oil and Grease            | mg/L                           | Once during permit term (October 2018) |
| Aluminum                  | µg/kg                          | Once during permit term (October 2018) |
| Iron                      | µg/kg                          | Once during permit term (October 2018) |
| Arsenic                   | µg/kg                          | Once during permit term (October 2018) |
| Cadmium                   | µg/kg                          | Once during permit term (October 2018) |
| Total Chromium            | µg/kg                          | Once during permit term (October 2018) |
| Copper                    | µg/kg                          | Once during permit term (October 2018) |
| Lead                      | µg/kg                          | Once during permit term (October 2018) |
| Mercury                   | µg/kg                          | Once during permit term (October 2018) |
| Nickel                    | µg/kg                          | Once during permit term (October 2018) |
| Silber                    | µg/kg                          | Once during permit term (October 2018) |
| Zinc                      | µg/kg                          | Once during permit term (October 2018) |
| Nonchlorinated Phenolics  | µg/kg                          | Once during permit term (October 2018) |
| Chlorinated Phenolics     | µg/kg                          | Once during permit term (October 2018) |
| Aldrin                    | µg/kg                          | Once during permit term (October 2018) |
| Diieldrin                 | µg/kg                          | Once during permit term (October 2018) |

| Parameter     | Units | Minimum Frequency of Sampling/Analysis |
|---------------|-------|----------------------------------------|
| Chlordane     | µg/kg | Once during permit term (October 2018) |
| DDT, DDE, DDD | µg/kg | Once during permit term (October 2018) |
| Endrin        | µg/kg | Once during permit term (October 2018) |
| PAHs          | µg/kg | Once during permit term (October 2018) |
| PCBs          | µg/kg | Once during permit term (October 2018) |
| Toxaphene     | µg/kg | Once during permit term (October 2018) |

When processing samples for analysis, macrofauna and large remnants greater than 0.25 inches (0.64 cm) should be removed, taking care to avoid contamination.

Sediment samples shall be analyzed according to *Quality Assurance and Quality Control (QA/QC) for 301(h) Monitoring Programs: Guidance on Field and Laboratory Methods* (EPA 430/9-86-004, 1987) and *Analytical Methods for U.S. EPA Priority Pollutants and 301(h) Pesticides in Estuarine and Marine Sediments* (EPA 503-6-90-004, 1986).

All sediment chemistry results shall be reported in the raw form and expressed on a dry weight basis. For all non-detect results, parameter detection limits shall be reported. Dry weight concentration target detection levels are indicated for National Oceanic and Atmospheric Administration (NOAA) National Status and Trends Program analyses.

Benthic monitoring results shall be included in the report with a complete discussion of benthic sediment survey results and potential influence of the discharge on sediment conditions in the study area. The discussion should be based on graphical, tabular, and/or appropriate statistical analyses of spatial and temporal patterns observed for raw sediment parameters. The report should also present an analysis of natural variation in sediment conditions, etc., which could influence the validity of study results. The Discharger’s sediment results may also be compared with the results of other applicable studies, numerical protective levels, etc., as appropriate.

Survey results shall be compared to pre-discharge and/or historical data using appropriate statistical methods.

**B. Benthic Community Monitoring**

Benthic infaunal organisms shall be monitored once per permit term in October 2018 at the benthic monitoring stations described in section II, Monitoring Locations, above. Benthic infaunal monitoring shall assess the temporal and spatial status of local benthic communities in relation to the outfall. Sampling shall be conducted as follows:

1. **Collection:** Five replicate samples shall be collected at each station using a 0.1 m<sup>2</sup> Van Veen grab sampler.
2. For benthic infauna analyses, each replicate sample shall be passed through a 1 mm screen, and the organisms retained and preserved as appropriate for subsequent identification. It is recommended that sample preservation, sample processing, and data analyses be conducted according to *Quality Assurance and Quality Control (QA/QC) for 301(h) Monitoring Programs: Guidance on Field and Laboratory Methods* (EPA 430/9-86-004, 1987).
3. Benthic infauna from each replicate sample shall be counted and identified to the lowest possible taxon. For each replicate sample, number of individuals, number of species,

and number of individuals per species, and within each major taxonomic group (polychaetes, molluscs, crustaceans, echinoderms, and all other macroinvertebrates) shall be recorded.

4. The benthic sampling report shall include a complete discussion of benthic infaunal survey results and (possible) influence of the outfall on benthic infauna communities in the study area. The discussion should be based on graphical, tabular, and/or appropriate statistical analyses of spatial and temporal patterns. Temporal trends in the number of individuals, number of species, number of individuals per species, and community structure indices, species richness (S), Margalef index (d), Shannon-Wiener index (H'), Brillouin index (h), Simpson's Index (SI), Swartz's dominance, and Infaunal Trophic Index (IT) shall be reported. The report should also present an analysis of natural community variation including the effects of different sediment conditions, oceanic seasons, and water temperatures, etc., that could influence the validity of study results. Survey results shall be compared to pre-discharge and/or historical data using appropriate statistical methods.

**X. BIOSOLIDS MONITORING**

- A. The following information shall be submitted with the Annual Report required by Standard Provision C.16. Adequate detail should be included to characterize biosolids in accordance with 40 C.F.R. 503.
  1. A representative sample of residual solids (biosolids) shall be obtained from the last point in the handling process (i.e., in the drying beds just prior to removal). All constituents shall be analyzed annually for total concentrations for comparison with total threshold limit concentration (TTLC) criteria. The Waste Extraction Test shall be performed on any constituent when the total concentration of the waste exceeds ten times the STLC limit for that substance. Twelve (12) discrete representative samples shall be collected at separate locations in the biosolids ready for disposal. These 12 samples shall be composited to form one (1) sample for constituent analysis. For accumulated, previously untested biosolids, the Discharger shall develop a representative sampling plan including number and location of sampling points, and collect representative samples. The analysis shall test for the metals required in 40 C.F.R. 503.16 (for land application) or 503.26 (for surface disposal), using the methods in *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (EPA Publication SW-846, all applicable editions and updates), as required in 503.8(b)(4), at the minimum frequencies established therein, provided in the table below.

**Table E-9. Amount of Biosolids and Frequency for Analysis**

| <b>Amount<sup>[1]</sup> (dry metric tons/365 day period)</b> | <b>Frequency<sup>[2]</sup></b>  |
|--------------------------------------------------------------|---------------------------------|
| Greater than zero, but less than 290                         | 1/Year.                         |
| Equal to or greater than 290 but less than 1,500             | 1/Quarter (four times per year) |
| Equal to or greater than 1,500 but less than 15,000          | 1/60 days (six times per year)  |
| Greater than 15,000                                          | 1/Month (twelve times per year) |

<sup>[1]</sup> For land application, either the amount of bulk biosolids applied to the land or the amount prepared for sale or give-away in a bag or other container for application to the land (dry weight basis). If the Discharger's biosolids are directly land applied without further treatment by another preparer, biosolids shall also be tested for organic-N, ammonium-N, and nitrate-N at the frequencies required. For surface disposal, the amount of biosolids placed on an active sludge unit (dry weight basis).

<sup>[2]</sup> Test results shall be expressed in mg pollutants per kg biosolids on a 100% dry weight basis.

Biosolids shall be analyzed annually for the constituents in the following table.

**Table E-10. Biosolids Monitoring Requirements**

| Constituent                              | Units                           | Type of Sample | Sampling/Analysis Frequency |
|------------------------------------------|---------------------------------|----------------|-----------------------------|
| Quantity Removed                         | Tons or yds <sup>3</sup>        | Measured       | Continual                   |
| Pathogen Density                         | --                              | --             | Per 40 C.F.R. 503           |
| Location Reuse/Disposal                  | General Public or Specific Site | --             | --                          |
| Moisture Content                         | %                               | Grab           | 1/Year                      |
| pH                                       | standard units                  | Grab           | 1/Year                      |
| Total Kjeldahl Nitrogen                  | mg/kg (dry) <sup>1</sup>        | Grab           | 1/Year                      |
| Ammonia (N)                              | mg/kg                           | Grab           | 1/Year                      |
| Nitrate (N)                              | mg/kg                           | Grab           | 1/Year                      |
| Total Phosphorus                         | mg/kg                           | Grab           | 1/Year                      |
| Oil and Grease                           | mg/kg                           | Grab           | 1/Year                      |
| Arsenic                                  | mg/kg                           | Grab           | 1/Year                      |
| Boron                                    | mg/kg                           | Grab           | 1/Year                      |
| Cadmium                                  | mg/kg                           | Grab           | 1/Year                      |
| Copper                                   | mg/kg                           | Grab           | 1/Year                      |
| Chromium (Hexavalent)                    | mg/kg                           | Grab           | 1/Year                      |
| Lead                                     | mg/kg                           | Grab           | 1/Year                      |
| Mercury                                  | mg/kg                           | Grab           | 1/Year                      |
| Molybdenum                               | mg/kg                           | Grab           | 1/Year                      |
| Nickel                                   | mg/kg                           | Grab           | 1/Year                      |
| Selenium                                 | mg/kg                           | Grab           | 1/Year                      |
| Silver                                   | mg/kg                           | Grab           | 1/Year                      |
| Zinc                                     | mg/kg                           | Grab           | 1/Year                      |
| Priority Pollutants (excluding asbestos) | mg/kg                           | Grab           | 1/Year                      |

<sup>[1]</sup> Total sample (including solids and any liquid portion) to be analyzed and results reported as mg/kg based on the dry weight of the sample.

2. Prior to land application, the Discharger shall demonstrate that the biosolids meet Class A or Class B pathogen reduction levels by one of the methods listed in 40 C.F.R. 503.32 (unless transferred to another preparer who demonstrates pathogen reduction).

Prior to disposal in a surface disposal site, the Discharger shall demonstrate that the biosolids meet Class B levels or shall ensure that the site is covered at the end of each operating day.

If pathogen reduction is demonstrated using a “Process to Significantly/Further Reduce Pathogens” (PFRP), the Discharger shall maintain daily records of the operating parameters to achieve this reduction.

The following applies when biosolids from the Discharger are directly land applied as Class B, without further treatment by a second preparer. If the Discharger demonstrates pathogen reduction by direct testing for fecal coliforms and/or pathogens, samples must be drawn at the frequency in Table E-7. If the Discharger demonstrates Class B pathogen reduction by testing for fecal coliform, at least seven grab samples must be drawn and analyzed during each monitoring event, and a geometric mean calculated from these seven samples. If the Discharger demonstrates Class A pathogen reduction by testing for fecal coliform and/or salmonella, plus one of the PFRP processes or testing

for enteric viruses and helminth ova at least four samples of fecal coliform or salmonella must be drawn during each monitoring event. All four samples must meet the limits specified in 40 C.F.R. 503.32(a).

3. For biosolids that are land applied or placed in a surface disposal site, the Discharger shall track and keep records of the operational parameters used to achieve Vector Attraction Reduction requirements in 40 C.F.R. 503.33(b).
4. Class 1 facilities (facilities with pretreatment programs or others designated as Class 1 by the regional administrator) and Federal facilities with greater than five MGD influent flow shall sample biosolids for pollutants listed under section 307(a) of the CWA (as required in the pretreatment section of the permit for POTWs with pretreatment programs). Class 1 facilities and Federal facilities greater than five MGD shall test dioxins/dibenzofurans using a detection limit of less than one pg/g at the times of their next priority pollutant scan if they have not done so within the past five years, and once per five years thereafter.
5. The biosolids shall be tested annually, or more frequently if necessary, to determine hazardousness. All constituents regulated under CCR Title 22, division 5, chapter 11, article 3 shall be analyzed for comparison with Total Threshold Limit Concentration (TTCL) criteria. The Waste Extraction Test shall be performed on any constituent when the total concentration of the waste exceeds ten times the Soluble Threshold Limit Concentration (STLC) limit for that substance.
6. If biosolids are placed in a surface disposal site (dedicated land disposal site or monofill), a qualified groundwater scientist shall develop a groundwater monitoring program for the site, or shall certify that the placement of biosolids on the site will not contaminate an aquifer.
7. Biosolids placed in a municipal landfill shall be tested by the Paint Filter Liquids Test (EPA Methods 9095) at the frequency determined by Table E-8, or more often if necessary to demonstrate that there are no free liquids.
8. The Discharger, either directly or through contractual agreements with their biosolids management contractors, shall comply with the following notification requirements:
  - a. *Notification of non-compliance.* The Discharger shall notify EPA Region 9, the Central Coast Water Board, and the Regional Board located in the region where the biosolids are used or disposed, of any non-compliance within 24 hours if the non-compliance may seriously endanger health or the environment. For other instances of non-compliance, the Discharger shall notify EPA Region 9 and the affected Regional Water Quality Boards of any non-compliance in writing within five working days of becoming aware of the non-compliance. The Discharger shall require their biosolids management contractors to notify EPA Region 9 and the affected Regional Water Quality Boards of any non-compliance within the same time frames.
  - b. If biosolids are shipped to another State of Indian lands, the Discharger must send notice at least 60 days prior to the shipment to the permitting authorities in the receiving State or Indian land (the EPA Region Office for that area and the State/Indian authorities).

- c. *For land application (in cases where Class B biosolids are directly applied without further treatment):* Prior to reuse of any biosolids from the Discharger's facility to a new or previously unreported site, the Discharger shall notify EPA, the Central Coast Water Board, and any other affected Regional Water Quality Board. The notification shall include description of the crops or vegetation to be grown, proposed loading rates and determination of agronomic rates.

If any biosolids within a given monitoring period do not meet 40 C.F.R. 503.13 metals concentration limits, the Discharger (or its contractor) must pre-notify EPA, and determine the cumulative metals loading to that site to date, as required in 40 C.F.R. 503.12.

The Discharger shall notify the applier of all the applier's requirements under 40 C.F.R. 503, including the requirement that the applier certify that the management practices, site restrictions, and any applicable vector attraction reduction requirements have been met. The Discharger shall require the applier to certify at the end of 38 months following application of Class B biosolids that the harvesting restrictions in effect for up to 38 months have been met.

- d. *For surface disposal:* Prior to disposal to a new or previously unreported site, the Discharger shall notify EPA and the Central Coast Water Board. The notice shall include a description and a topographic map of the proposed site, depth to groundwater, whether the site is lined or unlined, site operator, site owner, and any State or local permits. The notice shall describe procedures for ensuring public access and grazing restrictions for three years following site closure. The notice shall include a groundwater monitoring plan or description of why groundwater monitoring is not required.

- 9. The Discharger shall submit an annual biosolids report to the EPA Region 9 Biosolids Coordinator and Central Coast Water Board by February 19<sup>th</sup> of each year (per U.S. EPA guidance and 40 C.F.R. 503) for the period covering the previous calendar year. This report shall include:

- a. Annual biosolids removed in dry tons and percent solids.
- b. If appropriate, a narrative description of biosolids dewatering and other treatment processes, including process parameters, including a schematic diagram showing biosolids handling facilities. For example, if drying beds are used, report depth of application and drying time. If composting is used, report the temperature achieved and duration.
- c. A description of disposal methods, including the following information as applicable related to the disposal methods used at the facility. If more than one method is used, include the percentage and tonnage of annual biosolids production disposed by each method.
  - i. For landfill disposal include: 1) the central Coast Water Board WDR numbers that regulate the landfills used, 2) the present classifications of the landfills used, 3) the results of any groundwater monitoring, 4) certifications of management practices, and 5) the names and locations of the facilities receiving biosolids.

- ii. For land application include: 1) the location of the site(s), 2) the Central Coast Water Board's WDR numbers that regulate the site(s), 3) the application rate in lbs/acre/year (specify wet or dry), 4) certifications of management practices and site restrictions, and 5) subsequent uses of the land.
- iii. For offsite application by a licensed hauler and composter include: 1) the name, address and U.S. EPA license number of the hauler and composter.
- d. Copies of analytical data required by other agencies (i.e., U.S. EPA or County Health Department) and licensed disposal facilities (i.e., landfill, land application, or composting facility) for the previous year.
- e. Descriptions of pathogen reduction methods and vector attraction reduction methods. Including supporting time and temperature data, and certifications, as required in 40 C.F.R. 503.17 and 503.27.
- f. Names, mailing address, and street addresses of persons who received biosolids for storage, further treatment, disposal in a municipal waste landfill, or for other use or disposal methods not covered above, and amounts delivered to each.
- g. For all biosolids used or disposed at the Discharger's facility, the site and management practice information and certification required in 40 C.F.R. 503.17 and 503.27.
- h. For all biosolids temporarily stored, the information required in 40 C.F.R. 503.20 is required to demonstrate temporary storage.
- i. Reports shall be submitted to:  
  
Regional Biosolids Coordinator  
U.S. EPA (WTR-7)  
75 Hawthorne St.  
San Francisco, CA 94105-3901  
  
Executive Officer  
Central Coast Regional Water Quality Control Board  
895 Aerovista Place, Suite 101  
San Luis Obispo, CA 93401-7906

## **XI. OTHER MONITORING REQUIREMENTS**

### **A. Ocean Outfall and Diffuser Inspection**

The Discharger shall conduct an inspection of the outfall pipe/diffuser system annually to ensure the proper operation and structural integrity of the system. This inspection shall include general observations and photographic records of the outfall pipe/diffuser system and the surrounding ocean bottom in the vicinity of the outfall/diffuser. The inspection shall be conducted along the outfall pipe/diffuser system from landfall to its ocean terminus. A report detailing inspection results shall be submitted to the Central Coast Water Board and U.S. EPA with the annual report required in Standard Provisions C.8.

## **XII. REPORTING REQUIREMENTS**

**A. General Monitoring and Reporting Requirements**

1. The Discharger shall comply with all Federal Standard Provisions and Central Coast Water Board Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.

**B. Self-Monitoring Reports (SMRs)**

1. The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). The CIWQS Web site will provide additional information for SMR submittal in the event there will be a planned service interruption for electronic submittal. The Discharger shall use the current version of the Permittee Entry Template (PET) tool to configure data into the applicable CIWQS Data Format, and shall update that template according to this Order (e.g., add/delete parameters, revise limits, update monitoring locations, etc.). Blank versions of the latest PET tool are available at [http://www.waterboards.ca.gov/water\\_issues/program/ciwqs/chc\\_npdes.shtml](http://www.waterboards.ca.gov/water_issues/program/ciwqs/chc_npdes.shtml).
2. The Discharger shall report in the SMR the results for all monitoring specified in this MRP under sections III through IX. The Discharger shall submit SMR's including the results of all required monitoring using U.S. EPA-approved test methods or other test methods specified in this Order. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. Sampling and monitoring as required by this MRP shall begin on the effective date of this Order. The Discharger shall complete all required monitoring and reporting according to the following schedule unless otherwise directed by the Executive Officer:

**Table E-11. Monitoring Periods and Reporting Schedule**

| SMR Name                | Permit Section for Monitoring and Sampling Data Included in Report          | SMR Submittal Frequencies | SMR Due Date                                                                                            |
|-------------------------|-----------------------------------------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------|
| NPDES Monitoring Report | MRP sections III (Influent), IV (Effluent) V (Whole Effluent Toxicity), and | Monthly                   | First day of second calendar month following period of sampling                                         |
| NPDES Monitoring Report | MRP section IV (Effluent)                                                   | Semiannually              | March 1 <sup>st</sup> and September 1 <sup>st</sup> (following January and July sampling, respectively) |
| NPDES Monitoring Report | MRP section IV (Effluent)                                                   | Annual                    | February 1 <sup>st</sup> following calendar year of sampling                                            |
| NPDES Monitoring Report | MRP section VIII (Receiving Water)                                          | Quarterly                 | First day of second calendar month following period of sampling                                         |
| NPDES Monitoring Report | MRP section IX (Benthic)                                                    | Once per permit           | February 1, 2019                                                                                        |

| SMR Name                                  | Permit Section for Monitoring and Sampling Data Included in Report | SMR Submittal Frequencies | SMR Due Date                                                    |
|-------------------------------------------|--------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------|
| Biosolids Technical Report                | MRP section X (Biosolids)                                          | Annually                  | February 1 <sup>st</sup> following calendar year of sampling    |
| Ocean Outfall Inspection Technical Report | MRP section XI (Ocean Outfall and Diffuser Inspection)             | Annually                  | February 1 <sup>st</sup> following calendar year of sampling    |
| Summary Report                            | Attachment D, Standard Provision, VIII.D.8                         | Annually                  | April 1st following calendar year of sampling                   |
| Effluent Bacteria                         | Order section V.C.2.b Special Provisions                           | Quarterly                 | First day of second calendar month following period of sampling |

4. **Reporting Protocols.** The Discharger shall report with each sample result the applicable reported Minimum Level (reported ML, also known as the Reporting Level, or RL) and the current Method Detection Limit (MDL), as determined by the procedure in 40 C.F.R. part 136. For each parameter identified in Table 1 of the Ocean Plan, the Discharger shall use a ML no greater than specified in Appendix II of the Ocean Plan.

The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

- a. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
- b. Sample results less than the reported ML, but greater than or equal to the laboratory’s MDL, shall be reported as “Detected, but Not Quantified,” or DNQ. The estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words “Estimated Concentration” (may be shorted to “Est. Conc.”). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy ( $\pm$  a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

- c. Sample results less than the laboratory’s MDL shall be reported as “Not Detected,” or ND.
- d. Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.

5. **Compliance Determination.** Compliance with effluent limitations for Ocean Plan Table 1 parameters shall be determined using sample reporting protocols defined above and

Attachment A of this Order. For purposes of reporting and administrative enforcement by the Regional and State Water Board, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the Ocean Plan Table 1 parameter in the monitoring sample is greater than the effluent limitation and greater than or equal to the reported Minimum Level (ML).

- 6. Multiple Sample Data.** When determining compliance with an average monthly effluent limitation (AMEL), average weekly effluent limitation (AWEL), or maximum daily effluent limitation, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of “Detected, but Not Quantified” (DNQ) or “Not Detected” (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:
  - a.** The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
  - b.** The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.
- 7.** The Discharger shall submit SMR’s in accordance with the following requirements:
  - a.** The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
  - b.** The Discharger shall include in their CIWQS upload a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation. Uploaded reports must also include laboratory data sheets for the analytical results being presented.
  - c.** An Annual Self-Monitoring Report Summary shall be due on April 1 following each calendar year and shall include:
    - i.** All data required by this MRP for the corresponding monitoring period, including appropriate calculations to verify compliance with effluent limitations.
    - ii.** A discussion of any incident of non-compliance and corrective actions taken.

### **C. Discharge Monitoring Reports (DMRs)**

1. At any time during the term of this permit, the State or Central Coast Water Board may notify the Discharger to electronically submit SMRs that will satisfy federal requirements for submittal of DMRs. Until such notification is given specifically for the submittal of DMR's, the Discharger shall submit DMRs in accordance with the requirements described below.
2. DMRs must be signed and certified as required by the standard provisions (Attachment D). The Discharger shall submit the original DMR and one copy of the DMR to one of the addresses listed below:

| <b>STANDARD MAIL</b>                                                                                                                     | <b>FEDEX/UPS/<br/>OTHER PRIVATE CARRIERS</b>                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State Water Resources Control Board<br>Division of Water Quality<br>c/o DMR Processing Center<br>PO Box 100<br>Sacramento, CA 95812-1000 | State Water Resources Control Board<br>Division of Water Quality<br>c/o DMR Processing Center<br>1001 I Street, 15 <sup>th</sup> Floor<br>Sacramento, CA 95814 |

3. All discharge monitoring results must be reported on the official U.S. EPA pre-printed DMR forms (EPA Form 3320-1). Forms that are self-generated will not be accepted unless they follow the exact same format of EPA Form 3320-1.

**D. Other Reports**

1. Sanitary sewer overflows associated with the Discharger's collection system are subject to the online reporting and notifications requirements set forth in the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems Order No. 2006-0003-DWQ. The Discharger has enrolled under the statewide waste discharge requirements for sanitary sewer systems. Therefore, all prohibitions, provisions, and monitoring and reporting requirements apply to the Discharger. For any discharges of sewage to a drainage channel or surface water, the Discharger is required to notify the State Office of Emergency Services, the local health officer of directors of environmental health with jurisdiction over affected water bodies, and the Central Coast Water Board within two (2) hours after becoming aware of the discharge. Additionally, within 24-hours the Discharger shall submit to the Central Coast Water Board certification that the appropriate agencies (i.e., Office of Emergency Services and Environmental Health) have been notified of the sewage discharge to surface water bodies.

Additionally, any sanitary sewer overflows of wastewater (either partially treated or untreated) that are released at the wastewater treatment plant are subject to the same notifications requirements as mentioned above for collections systems.

2. The Discharger shall report the results of any special studies, monitoring, and reporting required by Special Provisions – VI.C. (Special Studies, Technical Reports, and Additional Monitoring) of the Order. The Discharger shall submit reports with the first monthly SMR scheduled to be submitted on or immediately following the report due date.

**ATTACHMENT F – FACT SHEET**

As described in section I, the Central Coast Water Board incorporates this Fact Sheet as findings of the Central Coast Water Board supporting the issuance of this Order. This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Only those sections or subsections of this Order that are specifically identified as “not applicable” have been determined not to apply to this Discharger. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to this Discharger.

**I. PERMIT INFORMATION**

The following table summarizes administrative information related to the facility.

**Table F-1. Facility Information**

|                                                     |                                                                            |

- A.** The City of Morro Bay and Cayucos Sanitary District (hereinafter Discharger) are the owners and operators of the City of Morro Bay – Cayucos Sanitary District Wastewater Treatment Plant (hereinafter Facility), a publicly owned treatment works (POTW).

For the purposes of this Order, references to the “discharger” or “permittee” in applicable

federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

- B.** The Facility discharges wastewater to the Pacific Ocean, a water of the United States. The Discharger was previously regulated by Order No. R3-2008-0065 and National Pollutant Discharge Elimination System (NPDES) Permit No. CA0047881 adopted on December 4, 2008, and expired on January 6, 2014. Attachment B provides a map of the area around the Facility. Attachment C provides a flow schematic of the Facility.

Prior to making any change in the point of discharge, place of use, or purpose of use of treated wastewater that results in a decrease of flow in any portion of a watercourse, the Discharger must file a petition with the State Water Board, Division of Water Rights, and receive approval for such a change. The State Water Board retains the jurisdictional authority to enforce such requirements under Water Code section 1211.

- C.** The Discharger filed a report of waste discharge and submitted an application for reissuance of its WDRs and NPDES permit on August 26, 2013.

**II. FACILITY DESCRIPTION**

**A. Description of Wastewater and Biosolids Treatment and Controls**

The Discharger owns and operates a wastewater treatment plant that provides sewerage service to the communities of the City of Morro Bay and Cayucos Sanitary District, serving approximately 12,835 people. All wastewater goes through primary treatment, including screening, grit removal, and primary sedimentation. A portion of the flow is diverted for secondary treatment process using biofilters, a solids-contact chamber, and a secondary clarifier. The secondary process also includes parallel single-stage, high-rate, trickling filters whose combined outflow goes to a solids contact channel and finally on to a secondary sedimentation tank. When flows exceed 1 MGD, secondary-treated effluent can be blended with primary treated effluent, and the blend is chlorinated and dechlorinated before discharge. This blending process will be discontinued as part of the planned new Facility, and all flows will meet at least full secondary treatment standards.

Biosolids removed by the primary clarifiers is heated in two mixed-primary digesters then transferred to a secondary digester. Stabilized sludge from the secondary digester is transferred to one of 12 sludge-drying beds. Drying times range from two to four months, and once dried, biosolids are removed from the beds and stored in a concrete containment area. Biosolids are stored in this area, usually for less than a year, until they are removed from the WWTP for composting and eventual use as a soil amendment.

**B. Discharge Points and Receiving Waters**

Wastewater is discharged to the Pacific Ocean through a 170-foot outfall/diffuser system. The outfall is 27 inches in diameter and is 2,900 feet from shore under approximately 50 feet of water. The diffuser was modeled to achieve a minimum initial dilution s of 133 to 1. The zone of initial dilution is approximately 103 feet wide and 240 feet long.

**Table F-2. Outfall Location**

| Discharge Point | Effluent Description | Discharge Point Latitude | Discharge Point Longitude | Receiving Water |
|-----------------|----------------------|--------------------------|---------------------------|-----------------|
|-----------------|----------------------|--------------------------|---------------------------|-----------------|

|     |                      |              |               |                           |
|-----|----------------------|--------------|---------------|---------------------------|
| 001 | Municipal Wastewater | 35° 23' 11"N | 120° 52' 29"W | Estero Bay, Pacific Ocean |
|-----|----------------------|--------------|---------------|---------------------------|

**C. Regulatory History**

The treatment plant was originally constructed in 1954 to provide primary treatment and was upgraded in 1964 to a capacity of 1.0 MGD. In 1982, the outfall was extended further offshore to its current location. A new treatment plant was designed in 1981 to expand treatment capacity and meet full secondary treatment standards. However, financial aid from state and federal agencies and sufficient alternative funding was not available. Consequently, the treatment plant's design was modified to provide biological treatment to a portion of the influent (approximately 1 MGD), of the projected flow. In March 1983, Central Coast Water Board staff tentatively concurred that such a discharge would comply with applicable state laws, including water quality standards, and would not result in requirements for additional treatment, pollution control, or other requirements on any other point or non-point sources.

The treatment plant was upgraded from 1983 to 1985 to a peak seasonal dry weather flow of 2.36 MGD. In 1985, U.S. EPA approved a Clean Water Act section 301(h) modified NPDES permit that waived fully secondary treatment requirements for biochemical oxygen demand (5-day @ 20°C) (BOD<sub>5</sub>) and total suspended solids (TSS). The permit required 75% removal of TSS and included a 30-day average TSS effluent limit of 70 mg/L. The permit required 30% removal of BOD<sub>5</sub> and included a 30-day average BOD<sub>5</sub> effluent limit of 120 mg/L. The permit also required an extensive monitoring program.

The permit was reissued in 1992 and the second permit reissuance process began in May 1997. Multiple discussions between the Discharger, Central Coast Water Board staff, and U.S. EPA staff resulted in several revisions to the permit and monitoring program, including a slight reduction in allowed mass-emissions of BOD<sub>5</sub>, TSS, and oil and grease; expanded biosolids reporting; revised benthic sampling locations; and a revised receiving water sampling program. In July 1998, staff again determined that the discharge would comply with applicable state laws, including water quality standards, and would not result in requirements for additional treatment, pollution control, or other requirements on any other pollutant sources. U.S. EPA issued a tentative decision to grant another modification of secondary treatment requirements in September 1998. In December 1998 the Central Coast Water Board approved the NPDES permit, waiving secondary treatment requirements. On January 13, 1998, the California Coastal Commission determined the permit was consistent with the Coast Zone Management Act. U.S. EPA issued the permit on January 26, 1999, which became effective March 1, 1999.

The Facility is now one of only two remaining in California that operates under a 301(h) modified permit, the other being Point Loma in San Diego County. In anticipation of the 2004 permit reissuance process, Central Coast Water Board staff met with and sent a letter to the Discharger in January 2003 that requested that it consider upgrading the treatment plant to meet federal secondary treatment standards and forgo its 301(h) modified permit. In a March 20, 2003 response, City of Morro Bay Manager Robert Hendrix wrote:

“...we are using your correspondence as a catalyst for the formation of a long-term future policy on wastewater treatment. The [Morro Bay] City Council and [Cayucos] Sanitary District Board have selected members to serve on a subcommittee to work with your staff to consider a number of alternatives, formulate a draft policy or policies, and then return to the full legislative body in the late Spring of this year [2003] with a recommended course of action.”

In mid-2003, the subcommittee commissioned a study as to whether an equalization basin could be added to improve treatment efficiency and allow the discharge to meet secondary treatment standards. The study concluded that an equalization basin would not accomplish this goal.

The Discharger submitted an application for reissuance of its Clean Water Act section 301(h) modified NPDES permit on July 7, 2003. It also requested a determination (“401 Certification”) as to whether the discharge will comply with applicable state laws, including water quality standards, and will not result in requirements for additional treatment, pollution control, or other requirements on any other pollutant sources. In an August 26, 2003 letter, Central Coast Water Board staff declined to make such a determination, instead deferring to the Central Coast Water Board to make such a determination through approval or disapproval of the NPDES permit.

The existing permit expired on March 1, 2004, but continued in force until the effective date of reissuance, in accordance with 40 C.F.R. part 122.6.

In June 2004, after public opposition to the 301(h) modified permit, the Discharger commenced a process to upgrade the treatment plant to meet secondary treatment standards. The Discharger hired Carollo Engineers to assist in development of a detailed timeline to implement the upgrade. Central Coast Water Board staff and U.S. EPA chose to delay the permit reissuance process until the timeline was developed. In April 2005, Carollo Engineers presented a 15-year timeline at a public meeting of the Discharge. After considering many public comments in opposition to the 15-year timeline, the Discharger rejected the 15-year timeline and directed Carollo Engineers to return with a timeline that was “quick as possible.”

In May 2005, Carollo Engineers returned and presented a 9.5-year timeline to the Discharger. The 9.5-year timeline was based on the shortest reasonable time necessary to select an engineering consultant, coordinate between the Dischargers, develop a facility plan, obtain financing and permits, and design and construct the improvements. The 9.5-year timeline required the Discharger to achieve full compliance with secondary treatment standards by June 23, 2015. The Discharger accepted the 9.5-year timeline and formally proposed it to Central Coast Water Board staff on June 15, 2005. Central Coast Water Board staff and the Discharger drafted a tentative settlement agreement that enforces the 9.5-year timeline, and provided for one more 301(h) modified permit. This 301(h) modified permit is necessary because the timeline to achieve compliance with secondary treatment standards exceeds the five-year life of an NPDES permit.

Prior to the May 11, 2006 meeting to present the modified 301(h) waiver NPDES permit, Central Coast Water Board staff and the Discharger entered into a revised settlement agreement that expedited the conversion schedule to 8.5 years. The Central Coast Water Board had questions regarding the potential effects of continued discharges from the Facility; more specifically, whether the continued Facility discharges would affect the southern sea otter and brown pelican. As a result, the Central Coast Water Board continued the hearing to allow U.S. EPA to develop an Endangered Species Act Biological Evaluation (BE) on the potential effects. Furthermore, the BE would be required to receiving concurrence of “no likely adverse effects” pursuant to section 7 of the Federal Endangered Species Act from the United States Fish and Wildlife Service (U.S. FWS).

The U.S. EPA drafted the BE on September 6, 2007, and requested concurrence of “no likely adverse effects” on the brown pelican and southern sea otter from the U.S. FWS. The BE recognizes no likely adverse effects on the southern sea otter and brown pelican provided that the Discharger implements conservation measures, which included:

- Public outreach program to minimize the input of cat litter-box wastes into the municipal sewer systems;
- Regular monitoring of nutrient loading from the facility’s ocean outfall; and
- Facility upgrade to at least full secondary or tertiary by 2014.

The U.S. FWS formally responded to the U.S. EPA’s request for concurrence in a letter dated December 21, 2007. The U.S. FWS letter concurred with the U.S. EPA’s findings indicating that continued discharges from the Facility would not likely have adverse effects to endangered species in the area. The U.S. FWS letter stated, “[w]e concur with your determination that the proposed project is not likely to adversely affect the brown pelican or southern sea otter.” However, the U.S. FWS letter recognized that there are material gaps in current data and that additional data gathering would optimize the understanding of potential effects from the continued discharge. The U.S. FWS letter stated, “[w]e recognize that the conservation measures proposed in the Biological Evaluation for this action will assist in gathering information useful in evaluation this issue, as will independent research being conducted by a number of interested parties.”

The Discharger submitted to Central Coast Water Board staff drafts for the development and implementation of a nutrient monitoring program and a Cat Litter Public Outreach program consistent with the conservation measures as proposed by U.S. EPA. These conservation measures were incorporated into the NPDES permit. The May 11, 2006 settlement agreement was updated to revise the conversion schedule and make other revisions to reflect new factual information available since the May 11, 2006 hearing. The Dischargers presented the updated settlement agreement to their governing boards for approval on November 19, 2008. In December 2008, the Discharger executed a Settlement Agreement with the Central Coast Water Board to upgrade the existing Facility to eliminate the need for the 301(h) waiver modified permit. The Settlement Agreement stated that the Central Coast Water Board Executive Officer shall recommend that the Central Coast Water Board concur in the issuance of the 2008 301(h) modified permit and that the Discharger shall upgraded the Facility so that all effluent is treated to at least secondary levels.

The 2008 Settlement Agreement contains a conversion schedule outlining the upgrade process and includes milestones for achieving critical phases of the proposed upgrade project.

**Table F-3. 2008 Settlement Agreement Conversion Schedule**

| Task                                                                                | Required Date of Completion |
|-------------------------------------------------------------------------------------|-----------------------------|

| Achieve Full Compliance with Secondary Treatment                                                      | March 31, 2014                           |

The 2008 Settlement Agreement further states that in the second permit cycle following the expiration of the 301(h) modified permit, that the Central Coast Water Board shall issue a NPDES permit that includes effluent limitations consistent with full secondary treatment requirements, or any more stringent requirements that are necessary or that the Discharger agrees to, and concurrently issue a 13385(j)(3) Order. The 13385(j)(3) Order shall include interim effluent limits for BOD<sub>5</sub> and suspended solids that are the same as those in the 301(h) modified permit.

The 2008 Settlement Agreement provides enforcement relief due to a “force majeure event,” defined as any event beyond the control of the Discharger, its contractors, or any entity controlled by the Discharger, including, but not limited to third-party litigation that delays the performance of any obligation under the Settlement Agreement despite the Discharger’s best efforts to fulfill the obligation. If the Executive Officer agrees that a violation of the Conversion Schedule has been caused by a force majeure event, the time for performance of an affected requirement shall be extended for a period not to exceed the actual delay in performance resulting from such circumstance.

The Discharger ultimately proposed to demolish the existing Facility and to construct a new wastewater treatment plant on the same site in the City of Morro Bay just inland of the beach. On September 20, 2010, the draft CEQA document for the project was completed and publicly noticed for comments, and on January 10, 2011, the Morro Bay City Council certified the final Environmental Impact Report and issued a Coastal Development Permit (CDP). The CDP was immediately appealed to the California Coastal Commission (CCC). On January 10, 2013, the CCC denied the CDP at a de novo hearing for construction of an upgraded wastewater treatment facility at its existing location. The denial was based on zoning inconsistency, failure to avoid coastal hazards, failure to include a sizable reclaimed water component, and the project is located within an LCP-designated sensitive view area.

On February 23, 2011, per the terms of the Settlement Agreement, the Discharger submitted a letter to the Central Coast Water Board stating that the appeal of the CDP to the CCC constituted a force majeure event under the terms of the Settlement Agreement. On March 24, 2011, the Central Coast Water Board responded that it agreed that the appeal constituted

a force majeure event, and in a letter from the same day stated, "In considering the JPA's compliance with the Compliance Schedule, the Water Board will extend the dates of the remaining Conversion Schedule for tasks contained with the Agreement paragraph B.1 for a period not to exceed the actual delay resulting from this force majeure event."

Following the January 10, 2013 CDP denial, on May 18, 2013, the City of Morro Bay issued a request for proposal for the preliminary planning consultant for a new water reclamation facility (WRF). On May 14, 2013, the City Council selected the consultant for the preliminary planning of the new WRF. A contract with the contractor was executed on June 10, 2013.

On December 10, 2013, the City of Morro Bay City Council chose three possible sites for development of the new WRF. In February 2014, the City of Morro Bay City Council established the goal of having the new WRF operational in five years.

On May 8, 2014, the consultant submitted to the City of Morro Bay a Report on Reclamation and Council Recommended WRF Sites that provided a comparative analysis of the three proposed sites. Based on the report, the City Council is expected to choose a single site to continue moving forward with a Work Plan and begin due diligence toward the eventual design and construction of the new WRF. The Discharger has made measured and deliberate progress in achieving secondary treatment consistent with the 2008 Settlement Agreement.

Since the time the Discharger originally applied for Order renewal, there have been significant changes in their planning for future treatment facilities to address the need for full secondary treatment, pursuant to the Settlement Agreement. The Discharger will be providing an updated compliance schedule as part of this planning effort, and Water Board staff anticipates preparing a time schedule order of no more than five-years duration to accompany the proposed facilities. No additional extension of schedule is available to meet these final effluent discharge limitations contained within this proposed Order.

Additionally, the Cayucos Sanitary District has moved forward with plans to design, construct, and operate its own wastewater treatment plant, separate from its existing use of the subject Facility. Water Board staff is working with Cayucos Sanitary District on those plans and expects to draft a separate NPDES and WDRs for its facility, when appropriate.

The Discharger has requested that this Order contain revised effluent limitation and monitoring requirements to reflect this changing status. CWA section 301(h) provides for a modification of secondary treatment standards for publicly owned treatment works that discharge into marine waters if the modified requirements do not interfere with the attainment or maintenance of water quality. U.S. EPA has promulgated specific regulations pertaining to CWA section 301(h) in 40 CFR, subpart G.

In order to obtain a 301(h) modified permit, an applicable must demonstrate that:

- There is an applicable water quality standard specific to the pollutant for which the modification is requested (usually BOD<sub>5</sub> and TSS);
- The discharge of pollutants in accordance with such modified requirements will not interfere, alone or in combination with pollutants from other sources, with the attainment or maintenance of that water quality which assures protection of public water supplies and protection and propagation of a balanced indigenous population of shellfish, fish, and wildlife, and allows recreational activities, in and on the water;

- The applicant has established a system for monitoring the impact of such discharge on a representative sample of aquatic biota, to the extent practicable, and the scope of such monitoring is limited to include only those scientific investigations which are necessary to study the effects of the proposed discharge;
- Such modified requirements will not result in any additional requirements on any other point or nonpoint source;
- All applicable pretreatment requirements for sources introducing waste into such treatment works will be enforced;
- In the case of any treatment works serving a population of 50,000 or more, with respect to any toxic pollutant introduced into such works by an industrial discharger for which pollutant there is no applicable pretreatment requirement in effect, sources introducing waste into such works are in compliance with all applicable pretreatment requirements, the applicant will enforce such requirements, and the applicant has in effect a pretreatment program which, in combination with the treatment of discharges from such works, removes the same amount of such pollutant as would be removed if such works were to apply secondary treatment to discharges and if such works had no pretreatment program with respect to such pollutant;
- To the extent practicable, the applicant has established a schedule of activities designed to eliminate the entrance of toxic pollutants from nonindustrial sources into such treatment works;
- There will be no new or substantially increased discharges from the point source of the pollutant to which the modification applies above that volume of discharge specified in the permit;
- The applicant at the time such modification becomes effective will be discharging effluent which has received at least primary or equivalent treatment and which meets the criteria established under section 304(a)(1) [of the CWA] after initial mixing in the waters surrounding or adjacent to the point at which such effluent is discharged [40 CFR part 125.57].

The conditions of the 2008 Settlement Agreement prohibited the Discharger from applying to U.S. EPA for a 301(h) waiver. U.S. EPA has not granted a 301(h) waiver, and full secondary treatment requirements must be implemented within this Order.

Consistent with Part B.2.b of the 2008 Settlement Agreement, this Order contains final effluent limitations and monitoring requirements. Concurrently with the issuance of this Order, the Central Coast Water Board shall consider a 13385(j)(3) order that includes interim effluent limitations for BOD<sub>5</sub> and TSS that are the same as those in the previous 301(h) modified permit. The compliance dates established within the 13385(j)(3) order will consider the 2008 Settlement Agreement Conversion Schedule, the force majeure event (the 2013 CCC denial of the CDP), and a projected five-year schedule.

#### **D. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data**

Effluent limitations contained in the existing Order for discharges from Discharge Point No. 001 (Monitoring Location EFF-001) and representative monitoring data from the term of the previous Order are as follows:

**Table F-4. Historic Effluent Limitations and Monitoring Data**

| Parameter                                                    | Units          | Effluent Limitation    |                |             | Monitoring Data<br>(From March 2009 – To Sept 2013) |                                  |                               |

[1] Values preceded with a “J” represent maximum effluent concentrations that were detected, but not quantifiable.

**E. Compliance Summary**

The Discharger violated numeric effluent limitations during the term of the previous Order. Three violations were for total chlorine violations due to equipment changes/malfunctions. The fourth violation was for total suspended solids and no further incidences of violation have occurred. The following table summarizes the violations of effluent limitations based on data collected from July 2009 through August 2017.

**Table F-7. Effluent Limitations Compliance Summary**

| Date       | Violation Type        | Pollutant               | Reported Value | Permit Limitation | Units |
|------------|-----------------------|-------------------------|----------------|-------------------|-------|
| 12/16/2014 | Maximum Daily         | Chlorine Total Residual | 3.0            | 1.07              | mg/L  |
| 04/15/2015 | Maximum Daily         | Chlorine Total Residual | 7.2            | 1.07              | mg/L  |
| 12/11/2015 | Maximum Daily         | Chlorine Total Residual | 4.5            | 1.07              | mg/L  |
| 11/04/2016 | Instantaneous Maximum | Total Suspended Solids  | 106            | 105               | mg/L  |

**F. Planned Changes**

The Discharger will begin construction on a new wastewater treatment plant within this permit term. However, the Discharger points out that the current wastewater treatment facility will need to remain in service and continue operations and that significant improvement is required to maintain compliance. The Discharger has thus adopted a Major Repair and Maintenance Plan (MMRP) schedule to ensure compliance is maintained. The draft MMRP schedule provided in the Discharger’s Report of Waste Discharge provided projected maintenance and improvement projects from fiscal year 2013 through 2018. The adopted budgets contain maintenance and improvement projects including the installation of new influent screens at the headworks, replacement of chains and flights in the chlorine contact tank, cleaning and repairs to a digester, pump and valve rebuild and replacement project, and the rehabilitation of the chlorine building. These projects have been partially completed, or are scheduled to be completed.

Since the time the Discharger originally applied for Order renewal, there have been significant changes in their planning for future treatment facilities to address the need for full secondary treatment, pursuant to the Settlement Agreement. The Discharger will be providing an updated compliance schedule as part of this planning effort, and Water Board staff anticipates preparing a time schedule order of no more than five-years duration to accompany the proposed facilities. No additional extension of schedule is available to meet these final effluent discharge limitations contained within this proposed Order.

**III. APPLICABLE PLANS, POLICIES, AND REGULATIONS**

The requirements contained in this Order are based on the requirements and authorities described in this section.

**A. Legal Authorities**

This Order serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the California Water Code (commencing with section 13260). This Order is also issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing

regulations adopted by the U.S. EPA and chapter 5.5, division 7 of the Water Code (commencing with section 13370). It shall serve as an NPDES permit for point source discharges from this facility to surface waters.

**B. California Environmental Quality Act (CEQA)**

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA, (commencing with section 21100) of Division 13 of the Public Resources Code.

**C. State and Federal Laws, Regulations, Policies, and Plans**

**1. Water Quality Control Plan.** The Regional Water Quality Control Board (Central Coast Water Board) adopted the *Water Quality Control Plan for the Central Coastal Basin* (hereinafter Basin Plan), the most recent version released in June 2011, that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for the Pacific Ocean and other receiving waters addressed through the plan. Requirements in this Order implement the Basin Plan.

Beneficial uses applicable to the Pacific Ocean are as follows:

**Table F-8. Basin Plan Beneficial Uses**

| Discharge Point | Receiving Water Name | Beneficial Use(s)                                                                                                                                                                                                                                                                  |
|-----------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 001             | Pacific Ocean        | Water Contact (REC-1)<br>Non-Contact Recreation (REC-2)<br>Industrial Supply (IND)<br>Navigation (NAV)<br>Marine Habitat (MAR)<br>Shellfish Harvesting (SHELL)<br>Commercial and Sport Fishing (COMM)<br>Rare, Threatened, or Endangered Species (RARE)<br>Wildlife Habitat (WILD) |

**2. California Ocean Plan.** The State Water Board adopted the *Water Quality Control Plan for Ocean Waters of California, California Ocean Plan* (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, 2005, 2009, and 2012. The State Water Board adopted the latest amendment on October 16, 2012, and it became effective on August 19, 2013. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. The Ocean Plan identifies beneficial uses of ocean waters of the state to be protected as summarized below.

**Table F-9. Ocean Plan Beneficial Uses**

| Discharge Point | Receiving Water | Beneficial Uses                                                                                                                                                                       |
|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 001             | Pacific Ocean   | Industrial water supply (IND)<br>Water Contact and non-contact recreation, including aesthetic enjoyment (REC-1 and REC-2)<br>Navigation (NAV)<br>Commercial and sport fishing (COMM) |

|  |  |                                                                                                                                                                                                                                                          |
|--|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | Mariculture (MARI)<br>Preservation and enhancement of designated Areas of Special Biological Significance (ASBS)<br>Rare and endangered species (RARE)<br>Marine habitat (MAR)<br>Fish migration (MIGR)<br>Fish spawning and shellfish harvesting (SPWN) |
|--|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

In order to protect the beneficial uses, the Ocean Plan establishes water quality objectives and a program of implementation. Requirements of this Order implement the Ocean Plan.

3. **Antidegradation Policy.** Federal regulation 40 C.F.R. section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution 68-16. Resolution 68-16 is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Central Coast Water Board's Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. The permitted discharge must be consistent with the antidegradation provision of section 131.12 and State Water Board Resolution 68-16.
4. **Anti-Backsliding Requirements.** Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.
5. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code, §§ 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the state, including protecting rare and endangered species. The Discharger is responsible for meeting all requirements of the applicable Endangered Species Act.

**D. Impaired Water Bodies on CWA 303(d) List**

CWA section 303(d) requires states to identify specific water bodies where water quality standards are not expected to be met after implementation of technology-based effluent limitations on point sources. For all 303(d) listed water bodies and pollutants, the Central Coast Water Board must develop and implement Total Maximum Daily Loads (TMDLs) that will specify Waste Load Allocations (WLAs) for point sources and Load Allocations (LAs) for non-point sources.

The U.S. EPA approved the State's 2010 303(d) list of impaired water bodies on November 12, 2010. The 2010 303(d) list does not identify the coast of the Pacific Ocean at Estero Bay in the vicinity of the point of discharge as being impaired.

## E. Other Plans, Polices and Regulations

1. **Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (State Water Board Order No. 2006-0003-DWQ).** The General Permit, adopted on May 2, 2006, is applicable to all “federal and state agencies, municipalities, counties, districts, and other public entities that own or operate sanitary sewer systems greater than one mile in length that collect and/or convey untreated or partially treated wastewater to a publicly owned treatment facility in the State of California.” The purpose of the General Permit is to promote the proper and efficient management, operation, and maintenance of sanitary sewer systems and to minimize the occurrences and impacts of sanitary sewer overflows. The Discharger is covered under the General Permit and must comply with its requirements.

## IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R. section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

### A. Discharge Prohibitions

1. **Discharge Prohibition III.A.** (Discharge of treated wastewater at a location or in a manner different from that described in this Order is prohibited). This prohibition is similar to the previous Order and is based on 40 C.F.R. 122.21(a), duty to apply, and CWC section 13260, which requires filing a ROWD before discharges can occur.
2. **Discharge Prohibition III.B.** (Discharges of radiological, chemical, or biological warfare agent or high level radioactive waste to the Ocean is prohibited). This prohibition is based on the 2015 Ocean Plan Discharge Prohibition I.1.a.
3. **Discharge Prohibition III.C.** (The discharge of municipal or industrial waste sludge to the Pacific Ocean is prohibited). This prohibition is retained from the current permit and is based on the 2015 Ocean Plan Discharge Prohibition I.3.
4. **Discharge Prohibition III.D, III.E** (The overflow or bypass of wastewater from the Discharger’s collection, treatment, or disposal facilities and the subsequent discharge of untreated or partially treated wastewater, except as provided for in Attachment D, Standard Provision I.G (Bypass), is prohibited.) The discharge of untreated or partially treated wastewater from the Discharger’s collection, treatment, or disposal facilities represents an unauthorized bypass pursuant to 40 C.F.R. 122.41(m) or an unauthorized discharge, which poses a threat to human health and/or aquatic life, and therefore, is explicitly prohibited by the Order. Discharge Prohibitions III.E is retained from the current permit.
5. **Discharge Prohibition III.F.** (Materials and substances that are prohibited). This prohibition is based on requirements of the Ocean Plan.

- 6. **Discharge Prohibition III.G.** (Discharge of chlorine or toxic substances used for disinfection prohibited). This prohibition is retained from the current Order.

**B. Technology-Based Effluent Limitations**

**1. Scope and Authority**

CWA section 301(b) requires U.S. EPA to develop secondary treatment standards for publicly-owned treatment works at a level of effluent quality attainably through applying secondary or equivalent treatment. U.S. EPA promulgated such technology-based effluent guidelines at 40 C.F.R. 133. These secondary treatment regulations include the following minimum requirements.

**Table F-10. Secondary Treatment Requirements**

| Parameter          | Units          | 30-Day Average | 7-Day Average |
|--------------------|----------------|----------------|---------------|
| BOD <sup>[1]</sup> | mg/L           | 30             | 45            |
| TSS <sup>[1]</sup> | mg/L           | 30             | 45            |
| pH                 | standard units | 6.0 – 9.0      |               |

<sup>[1]</sup> The 30-day average percent removal for BOD<sub>5</sub> and TSS shall not be less than 85 percent.

In addition to the secondary treatment standards established in 40 C.F.R. 133, the State Water Board, in Table 2 of the Ocean Plan, has supplemented these technology-based requirements with additional requirements for conventional pollutants (settleable matter, oil and grease), which are applicable to the Facility. The Ocean Plan requirements are discussed in section IV.B.2 of this Fact Sheet.

**2. Applicable Technology-Based Effluent Limitations**

Title 40 C.F.R. 122.45(f)(1) requires effluent limitations be expressed in terms of mass, with some exceptions, and 40 C.F.R. 122.45(f)(2) allows pollutants that are limited in terms of mass to additionally be limited in terms of other units of measurement. This Order includes effluent limitations expressed in terms of mass and concentration. In addition, pursuant to the exceptions to mass limitations provided in 40 C.F.R. 122.45(f)(1), some effluent limitations are not expressed in terms of mass, such as pH and temperature, and when the applicable standards are expressed in terms of concentration and mass limitations are not necessary to protect the beneficial uses of the receiving waters.

- a. **BOD<sub>5</sub> and TSS.** Federal Regulations, 40 C.F.R. 133, establish the minimum weekly and monthly average level of effluent quality attainable by secondary treatment for BOD and TSS. Effluent limitations for BOD<sub>5</sub> and TSS have thus been established in this Order based on these standards.

Additionally, 40 C.F.R. 133.102, in describing the minimum level of effluent quality attainable by secondary treatment, states that the 30-day average percent removal shall not be less than 85 percent. This Order includes a limitation requiring an average of 85 percent removal of BOD and TSS over each calendar month.

- b. **pH.** Federal Regulations, 40 C.F.R. 133, establishes technology-based effluent limitations for pH. The secondary treatment standards require the pH of the effluent

to be no lower than 6.0 and no greater than 9.0 standard units. This pH range is also consistent with the Ocean Plan Table 2 effluent limitations.

- c. **Settleable Solids.** The Ocean Plan Table 2 establishes the minimum weekly, monthly, and maximum average of effluent quality attainable by secondary treatment for settleable solids. Effluent limitations for settleable solids have been established in this Order based on these requirements.
- d. **Oil and Grease.** The Ocean Plan Table 2 establishes the minimum weekly, monthly, and maximum average of effluent quality attainable by secondary treatment for oil and grease. Effluent limitations for oil and grease have been established in this Order based on these requirements.
- e. **Turbidity.** The Ocean Plan Table 2 establishes the minimum weekly, monthly, and maximum average of effluent quality attainable by secondary treatment for turbidity. Effluent limitations for turbidity have been established in this Order based on these requirements.

The following table summarizes technology-based effluent limitations established by the Order.

**Table F-11. Technology-Based Effluent Limitations**

| Parameter                                                                 | Units                  | Effluent Limitations     |                |               |
|---------------------------------------------------------------------------|------------------------|--------------------------|----------------|---------------|
|                                                                           |                        | Average Monthly          | Average Weekly | Maximum Daily |
| Biochemical Oxygen Demand 5-day @ 20°C (BOD <sub>5</sub> ) <sup>[1]</sup> | mg/L                   | 30                       | 45             | --            |
|                                                                           | lbs/day <sup>[2]</sup> | 515                      | 773            | --            |
| Total Suspended Solids (TSS) <sup>[1]</sup>                               | mg/L                   | 30                       | 45             | --            |
|                                                                           | lbs/day <sup>[2]</sup> | 515                      | 773            | --            |
| Oil and Grease                                                            | mg/L                   | 25                       | 40             | 75            |
|                                                                           | lbs/day <sup>[2]</sup> | 430                      | 687            | 1,289         |
| Settleable Solids                                                         | mL/L                   | 1.0                      | 1.5            | 3.0           |
| Turbidity                                                                 | NTU                    | 75                       | 100            | 225           |
| pH                                                                        | standard units         | 6.0 – 9.0 <sup>[3]</sup> |                |               |

<sup>[1]</sup> The 30-day average percent removal for BOD and TSS shall not be less than 85 percent.

<sup>[2]</sup> Mass-based effluent limitations were calculated using the following formula:  
lbs/day = pollutant concentration (mg/L) \* Design flow (2.06 MGD) \* conversion factor (8.34)

<sup>[3]</sup> Applied as an instantaneous minimum and maximum.

**C. Water Quality-Based Effluent Limitations**

**1. Scope and Authority**

CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

Section 122.44(d)(1)(i) of 40 C.F.R. requires that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been

established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other state plans and policies, or any applicable water quality criteria contained in the Ocean Plan.

## **2. Applicable Beneficial Uses and Water Quality Criteria and Objectives**

Beneficial uses for ocean waters of the Central Coast Region are established by the Basin Plan and Ocean Plan and are described in section III.C of this Fact Sheet.

Water quality criteria applicable to ocean waters of the Region are established by the Ocean Plan, which includes WQOs for bacterial characteristics, physical characteristics, chemical characteristics, biological characteristics, and radioactivity. The WQOs from the Ocean Plan are incorporated as receiving water limitations in this Order. In addition, Table 1 of the Ocean Plan contains numeric WQOs for 83 toxic pollutants for the protection of marine aquatic life and human health. Pursuant to NPDES regulations at 40 C.F.R. 122.44(d)(1), and in accordance with procedures established by the Ocean Plan (2015), the central Coast Water Board has performed a reasonable potential analysis (RPA) to determine the need for effluent limitations for Table 1 toxic pollutants.

## **3. Determining the Need for WQBELs**

Procedures for performing an RPA for ocean dischargers are described in section III.C and Appendix VI of the Ocean Plan. The procedure is a statistical method that projects an effluent data set while taking into account the averaging period of WQOs, the long term variability of pollutants in the effluent, limitations associated with sparse data sets, and uncertainty associated with censored data sets. The procedure assumes a lognormal distribution of the effluent data set, and compares the 95<sup>th</sup> percentile concentration at 95 percent confidence of each Table 1 pollutant, accounting for dilution, to the applicable water quality criterion. The RPA results in one of the three following endpoints:

- Endpoint 1 - There is "reasonable potential." An effluent limitation must be developed for the pollutant. Effluent monitoring for the pollutant, consistent with the monitoring frequency in Appendix III (Ocean Plan), is required.
- Endpoint 2 - There is no "reasonable potential." An effluent limitation is not required for the pollutant. Appendix III (Ocean Plan) effluent monitoring is not required for the pollutant; the Central Coast Board, however, may require occasional monitoring for the pollutant or for whole effluent toxicity as appropriate.

Endpoint 3 - The RPA is inconclusive. Monitoring for the pollutant or whole effluent toxicity testing, consistent with the monitoring frequency in Appendix III, is required. An existing effluent limitation for the pollutant shall remain in the permit, otherwise the permit shall include a reopener clause to allow for subsequent modification of the permit to include an effluent limitation if monitoring establishes that the discharge causes, has the reasonable potential to cause, or contribute to an excursion above a Table 1 water quality objective.

The State Water Board has developed a reasonable potential calculator, which is available at:

[http://www.waterboards.ca.gov/water\\_issues/programs/ocean/docs/trirev/stakeholder050505/rpcalc22\\_setup.zip](http://www.waterboards.ca.gov/water_issues/programs/ocean/docs/trirev/stakeholder050505/rpcalc22_setup.zip)

The calculator (RPcalc 2.2) was used in the development of this Order and considers several pathways in the determination of reasonable potential.

**a. First Path**

If available information about the receiving water or the discharge supports a finding of reasonable potential without analysis of effluent data, the Central Coast Water Board may decide that WQBELs are necessary after a review of such information. Such information may include: the facility or discharge type, solids loading, lack of dilution, history of compliance problems, potential toxic effects, fish tissue data, 303(d) status of the receiving water, the presence of threatened or endangered species or their critical habitat, or other information.

**b. Second Path**

If any pollutant concentration, adjusted to account for dilution, is greater than the most stringent applicable WQO, there is reasonable potential for that pollutant.

**c. Third Path**

If the effluent data contains three or more detected and quantified values (i.e., values that are at or above the minimum level (ML)), and all values in the data set are at or above the ML, a parametric RPA is conducted to project the range of possible effluent values. The 95<sup>th</sup> percentile concentration is determined at 95 percent confidence for each pollutant, and compared to the most stringent applicable water quality objective to determine reasonable potential. A parametric analysis assumes that the range of possible effluent values is distributed log-normally. If the 95<sup>th</sup> percentile value is greater than the most stringent applicable water quality objective, there is reasonable potential for that pollutant.

**d. Fourth Path**

If the effluent data contains three or more detected and quantified values (i.e., values that are at or above the ML), but at least one value in the data set is less than the ML, a parametric RPA is conducted according to the following steps:

- i. If the number of censored values (those expressed as a “less than” value) account for less than 80 percent of the total number of effluent values, calculate the  $M_L$  (the mean of the natural log of transformed data) and  $S_L$  (the standard deviation of the natural log of transformed data) and conduct a parametric RPA, as described above for the Third Path.
- ii. If the total number of censored values account for 80 percent of the total number of effluent values, conduct a non-parametric RPA, as described below for the Fifth Path. (A non-parametric analysis becomes necessary when the effluent data is limited, and no assumptions can be made regarding its possible distribution).

**e. Fifth Path**

A non-parametric RPA is conducted when the effluent data set contains less than three detected and quantified values, or when the effluent data set contains three or more detected and quantified values but the number of censored values accounts for 80 percent or more of the total of effluent values. A non-parametric analysis is conducted by ordering the data, comparing each result to the applicable WQO, and accounting for ties. The sample number is reduced by one for each tie, when the dilution-adjusted method detection limit (MDL) is greater than the water quality objective. If the adjusted sample number, after accounting for ties, is greater than 15, the pollutant has no reasonable potential to exceed the WQO. If the sample number is 15 or less, the RPA is inconclusive, monitoring is required, and any existing effluent limits in the expiring permit are retained.

In this case, a RPA was conducted using effluent monitoring data from January 2009 to July 2013. The implementation provisions for Table 1 in section III.C of the Ocean Plan specify that the minimum initial dilution is the lowest average initial dilution within any single month of the year. Dilution estimates shall be based on observed waste flow characteristics, observed receiving water density structure, and the assumption that no currents of sufficient strength to influence the initial dilution process flow across the discharge structure. Order No. 2008-0065 determined the minimum initial dilution factor (Dm) for the discharge to be 133 to 1 (seawater to effluent). This Dm of 133:1 will be retained from the current Order and applied to the WQBELs established herein. If the actual dilution ratio is found to be different, then the ratio will be recalculated and this Order may be reopened when and as appropriate.

A summary of the RPA results is provided below.

**Table F-12. RPA Results**

| Parameter                        | Units | N <sup>[1]</sup> | MEC <sup>[2],[3]</sup> | Most Stringent Criteria | Background            | RPA Endpoint <sup>[4]</sup> |
|----------------------------------|-------|------------------|------------------------|-------------------------|-----------------------|-----------------------------|
| Arsenic, Total Recoverable       | µg/L  | 9                | J 2                    | 8 <sup>[5]</sup>        | 3 <sup>[6]</sup>      | 3                           |
| Cadmium, Total Recoverable       | µg/L  | 9                | J 10                   | 1 <sup>[5]</sup>        | 0                     | 3                           |
| Chromium (VI), Total Recoverable | µg/L  | 9                | J 10                   | 2 <sup>[5]</sup>        | 0                     | 3                           |
| Copper, Total Recoverable        | µg/L  | 9                | 22                     | 3 <sup>[5]</sup>        | 2 <sup>[6]</sup>      | 2                           |
| Lead, Total Recoverable          | µg/L  | 9                | 1.8                    | 2 <sup>[5]</sup>        | 0                     | 2                           |

[1] Number of data points available for the RPA.

[2] If there is a detected value, the highest reported value is summarized in the table. If there are no detected values, the lowest MDL is summarized in the table. Values preceded with a "J" represent maximum effluent concentrations that were detected, but not quantifiable.

[3] Note that the reported MEC does not account for dilution. The RPA does account for dilution; therefore it is possible for a parameter with an MEC in exceedance of the most stringent criteria not to present a RP (i.e., Endpoint 1).

[4] Endpoint 1 – RP determined, limit required, monitoring required.

Endpoint 2 – Discharger determined not to have RP, monitoring may be established.

Endpoint 3 – RPA was inconclusive, carry over previous limits if applicable, establish monitoring.

[5] Based on the 6-Month Median in Table 1 of the Ocean Plan.

[6] Background concentrations contained in Table 3 of the Ocean Plan.

[7] Based on the Daily Maximum in Table 1 of the Ocean Plan.

[8] Non-chlorinated phenolic compounds represent the sum of 2,4-dimethylphenol; 4,6-dinitro-2-methylphenol; 2,4,5-dinitrophenol; 2-methylphenol; 4-methylphenol; 2-nitrophenol; 4-nitrophenol; and phenol.

[9] Chlorinated phenolic compounds represent the sum of 4-chloro-3-methylphenol; 2-chlorophenol; pentachlorophenol; 2,4,5-trichlorophenol; and 2,4,6-trichlorophenol.

| Parameter | Units | N <sup>[1]</sup> | MEC <sup>[2],[3]</sup> | Most Stringent Criteria | Background | RPA Endpoint <sup>[4]</sup> |
|-----------|-------|------------------|------------------------|-------------------------|------------|-----------------------------|
|-----------|-------|------------------|------------------------|-------------------------|------------|-----------------------------|

- [10] Endosulfan represents the sum of alpha-endosulfan, beta-endosulfan, and endosulfan sulfate.
- [11] HCH (hexachlorocyclohexane) represents the sum of the alpha, beta, gamma (Lindane), and delta isomers of hexachlorocyclohexane.
- [12] Not to exceed limits specified in Title 17, Division 1, Chapter 5, Subchapter 4, Group 3, Article 3, section 30253 of the California Code of Regulations.
- [13] Based on 30-Day Average in Table 1 of the Ocean Plan.
- [14] Dichlorobenzenes represent the sum of 1,2- and 1,3-dichlorobenzene.
- [15] Chlordane represents the sum of chlordane-alpha, chlordane-gamma, chlordane-alpha, chlordane-gamma, nonachlor-alpha, nonachlor-gamma, and oxychlordane.
- [16] DDT represents the sum of 4,4'-DDT; 2,4'-DDT; 4,4'-DDE; 2,4'-DDE; 4,4'-DDD; and 2,4'-DDD.
- [17] Halomethanes represent the sum of bromoform, bromomethane (methyl bromide), and chloromethane (methyl chloride).
- [18] PAHs (polynuclear aromatic hydrocarbons) represent the sum of acenaphthene; anthracene; 1,2-benzanthracene; 2,4-benzofluoranthene; benzo[k]fluoranthene; 1,12-benzoperylene; benzo[a]pyrene; chrysene; dibenzo[a,h]anthracene; fluorine; ideno[1,2,3-cd]pyrene; phenanthrene; and pyrene.
- [19] PCBs (polychlorinated biphenyls) represent the sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.
- [20] TCDD equivalents represent the sum of concentrations of chlorinated dibenzodioxins (2,3,7,8-CDDs) and chlorinated dibenzofurans (2,3,7,8-CDFs) multiplied by their respective toxicity factors, as shown by the table below. U.S. EPA Method 8280 may be used to analyze TCDD equivalents.

| Isomer Group          | Toxicity Equivalence Factor |
|-----------------------|-----------------------------|
| 2,3,7,8 – tetra CDD   | 1.0                         |
| 2,3,7,8 – penta CDD   | 0.5                         |
| 2,3,7,8 – hexa CDD    | 0.1                         |
| 2,3,7,8 – hepta CDD   | 0.01                        |
| octa CDD              | 0.001                       |
| 2,3,7,8 – tetra CDF   | 0.1                         |
| 1,2,3,7,8 – penta CDF | 0.05                        |
| 2,3,4,7,8 – penta CDF | 0.5                         |
| 2,3,7,8 – hexa CDFs   | 0.1                         |
| 2,3,7,8 – hepta CDFs  | 0.01                        |
| octa CDF              | 0.001                       |

**4. WQBEL Calculations**

- a. From the Table 1 WQOs in the Ocean Plan, effluent limitations were calculated according to the following equation for all pollutants, except for acute toxicity and radioactivity:

$C_e = C_o + D_m (C_o - C_s)$  where,

$C_e$  = the effluent limitation (µg/L)

$C_o$  = the WQO to be met at the completion of initial dilution (µg/L)

$C_s$  = background seawater concentration

$D_m$  = minimum probable initial dilution expressed as parts seawater per part wastewater

- b. Initial dilution (Dm) has been determined to be 133 to 1 by the Central Coast Water Board.
- c. Table 3 of the Ocean Plan establishes background concentrations for some pollutants to be used when determining reasonable potential (represented as “Cs”). In accordance with Table 1 implementing procedures, Cs equals zero for all pollutants not established in Table 3. The background concentrations provided in Table 3 are summarized below:

**Table F-13. Pollutants Having Background Concentrations**

| Pollutant | Background Seawater Concentration |
|-----------|-----------------------------------|
| Arsenic   | 3 µg/L                            |
| Copper    | 2 µg/L                            |
| Mercury   | 0.0005 µg/L                       |
| Silver    | 0.16 µg/L                         |
| Zinc      | 8 µg/L                            |

- d. A summary of WQBELs established for Discharge Point No. 001 in this Order are provided in Tables F-14a – F-14c.

**Table F-14a. Effluent Limitations, Protection of Marine Aquatic Life**

| Parameter                            | Units   | Effluent Limitation        |                              |                                      |

| Radioactivity | [4]     |                            |                              |                                      |

<sup>[1]</sup> The six-month median shall apply as a moving median of daily values for any 180-day period in which daily values represent flow weighted average concentrations within a 24-hour period. For intermittent discharges, the daily value shall be considered equal to zero for days on which no discharge occurred. The six-month median limit on daily mass emissions shall be determined using the six-month medial effluent concentration  $C_e$  and the observed flow rate,  $Q$ , in million gallons per day (MGD).

<sup>[2]</sup> The daily maximum shall apply to flow weighted 24-hour composite samples. The daily maximum mass emission shall be determined using the daily maximum effluent concentration limit as  $C_e$  and the observed flow rate,  $Q$ , in MGD.

<sup>[3]</sup> The instantaneous maximum shall apply to grab sample determinations.

<sup>[4]</sup> Not to exceed limits specified in Title 17, Division 1, Chapter 5, Subchapter 4, Group 3, Article 3, section 30253 of the California Code of Regulations

**Table F-14b. Effluent Limitations – Protection of Human Health – Non-Carcinogens**

| Parameter                       | Units   | Effluent Limitation |
|---------------------------------|---------|---------------------|
|                                 |         | 30-day Average      |
| Acrolein                        | µg/L    | 29,500              |
|                                 | lbs/day | 507                 |

- [1] Sum of chlorodane-alpha, chlorodane-gamma, chlorodene-alpha, chlorodene-gamma, nonachlor-alpha, nonachlor gamma, and oxychlorodane.
- [2] Sum of 4,4'-DDT, 2,4'-DDT, 4,4'-DDE, 2,4'-DDE, 4,4'-DDD, and 2,4'-DDD.
- [3] Sum of bromoform, bromoethane (methylbromide), chloromethane (methyl chloride), chlorodibromomethane, and dichlorobromomethane.
- [4] Sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,1,2-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[a,h]anthracene, fluorine, ideno[1,2,3-cd]pyrene, phenanthrene, and pyrene.
- [5] Sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.

**5. Whole Effluent Toxicity (WET)**

WET limitations protect receiving water from the aggregated toxic effect of a mixture of pollutants in effluent. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach allows for protection of the narrative “no toxics in toxic amounts” criterion while implementing numeric criteria for toxicity. There are two types of WET tests – acute and chronic. An acute test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and growth.

Order No. R3-2008-0065 established effluent limitations for both acute and chronic toxicity and semiannual monitoring for chronic toxicity. There was no acute toxicity monitoring requirement, thus an RPA could not be performed. The effluent limitations and monitoring requirements will be retained in this permit. The RPA for chronic toxicity demonstrates that chronic toxicity does not appear to have reasonable potential to exceed water quality objectives. However, effluent data for total residual chlorine indicate reasonable potential to exceed water quality objectives for the protection of marine aquatic life. Due to the potential for toxic impacts to aquatic life, reasonable potential for chronic toxicity is retained based on Step 13 of Appendix VI of the Ocean Plan, which

requires the consideration of all available information to determine if a WQBEL is required. Further, section III.C.4.c of the Ocean Plan requires that chronic toxicity be monitored when dilution is between 100:1 and 350: 1. Monitoring for chronic toxicity has been retained to evaluate compliance with the applicable effluent limitation and based on the available dilution for the discharge location of 133:1.

The Discharger will be required to implement a Toxicity Reduction Evaluation (TRE) Workplan, as described in section V.C.2.a of the Order. When monitoring measures WET in the effluent above the limitation established by the Order, the Discharger must resample, if the discharge is continuing, and retest.

**D. Final Effluent Limitation Considerations**

**1. Anti-Backsliding Requirements**

Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 C.F.R. section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. All effluent limitations in this Order, with some exceptions discussed below, are at least as stringent as the effluent limitations in the previous Order.

Effluent limitations for ammonia, copper, lead, selenium, and zinc have been removed from this Order. The removal of the effluent limitations for these parameters is based on the availability of new information, including available effluent data, consistent with 40 C.F.R. 122.44(i)(B).

**2. Antidegradation Policies**

Provisions of this Order are consistent with applicable anti-degradation policy expressed by NPDES regulations at 40 C.F.R. 131.12 and by State Water Board Resolution No. 68-16. The Order does not authorize increases in discharge rates or pollutant loadings, and its limitations and conditions otherwise assure maintenance of the existing quality of receiving waters.

**3. Stringency of Requirements for Individual Pollutants**

This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. The technology-based effluent limitations consist of restrictions on BOD<sub>5</sub>, TSS, oil and grease, turbidity, pH, and settleable solids. Restrictions on these pollutants are discussed in the Fact Sheet, in section IV.B. This Order's technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements. In addition, this Order contains effluent limitations more stringent than the minimum, federal technology-based requirements that are necessary to meet water quality standards. These limitations are not more stringent than required by the CWA.

**4. Summary of Final Effluent Limitations – Discharge Point No. 001**

**Table F-15. Final Effluent Limitations**

| Parameter                                                                 | Units                  | Effluent Limitations   |                |               |
|---------------------------------------------------------------------------|------------------------|------------------------|----------------|---------------|
|                                                                           |                        | Average Monthly        | Average Weekly | Maximum Daily |
| Biochemical Oxygen Demand 5-day @ 20°C (BOD <sub>5</sub> ) <sup>[1]</sup> | mg/L                   | 30                     | 45             | --            |
|                                                                           | lbs/day <sup>[2]</sup> | 515                    | 773            | --            |
| Total Suspended Solids (TSS) <sup>[1]</sup>                               | mg/L                   | 30                     | 45             | --            |
|                                                                           | lbs/day <sup>[2]</sup> | 515                    | 773            | --            |
| Oil and Grease                                                            | mg/L                   | 25                     | 40             | 75            |
|                                                                           | lbs/day <sup>[2]</sup> | 430                    | 687            | 1,289         |
| Settleable Solids                                                         | ml/L                   | 1.0                    | 1.5            | 3.0           |
| pH                                                                        | standard units         | 6.0 – 9.0 at all times |                |               |
| Turbidity                                                                 | NTU                    | 75                     | 100            | 225           |

<sup>[1]</sup> The average monthly percent removal for BOD and TSS shall not be less than 85 percent.

<sup>[2]</sup> Mass based effluent limitations were calculated using the following formula:  
lbs/day = pollutant concentration (mg/L) \* Design flow (2.06 MGD) \* conversion factor (8.34)

5. **Percent Removal:** The average monthly percent removal of BOD<sub>5</sub> and TSS shall not be less than 85 percent.
6. **Dry Weather Flow.** Effluent peak seasonal dry weather flow shall not exceed a monthly average of 2.36 million gallons per day.
7. **Bacteria**
  - a. Total Coliform
    - i. The total coliform concentrations shall not exceed a 30-day geometric mean of 23 MPN/100 mL.
    - ii. No total coliform single sample shall exceed 2,400 MPN/100 mL.

[1] The six-month median shall apply as a moving median of daily values for any 180-day period in which daily values represent flow weighted average concentrations within a 24-hour period. For intermittent discharges, the daily value shall be considered equal to zero for days on which no discharge occurred. The six-month median limit on daily mass emissions shall be determined using the six-month medial effluent concentration  $C_e$  and the observed flow rate, Q, in million gallons per day (MGD).

[2] The daily maximum shall apply to flow weighted 24-hour composite samples. The daily maximum mass emission shall be determined using the daily maximum effluent concentration limit as  $C_e$  and the observed flow rate, Q, in MGD.

[3] The instantaneous maximum shall apply to grab sample determinations.

[4] Not to exceed limits specified in Title 17, Division 1, Chapter 5, Subchapter 4, Group 3, Article 3, section 30253 of the California Code of Regulations.

**Table F-16b. Final Effluent Limitations – Protection of Human Health – Non-Carcinogens**

| Parameter                       | Units   | Effluent Limitation |
|---------------------------------|---------|---------------------|
|                                 |         | 30-day Average      |
| Acrolein                        | µg/L    | 29,500              |
|                                 | lbs/day | 507                 |
| Antimony                        | µg/L    | 160,800             |
|                                 | lbs/day | 2,763               |
| Bis(2-chloroethoxy) methane     | µg/L    | 590                 |
|                                 | lbs/day | 10                  |
| Bis(2-chloroisopropyl) ether    | µg/L    | 160,800             |
|                                 | lbs/day | 2,763               |
| Chlorobenzene                   | µg/L    | 76,400              |
|                                 | lbs/day | 1,313               |

| Vinyl chloride            | µg/L    | 4,820                   |
|                           | lbs/day | 83                      |

[1] Sum of chlorodane-alpha, chlorodane-gamma, chlorodene-alpha, chlorodene-gamma, nonachlor-alpha, nonachlor gamma, and oxychlorodane.  
[2] Sum of 4,4'-DDT, 2,4'-DDT, 4,4'-DDE, 2,4'-DDE, 4,4'-DDD, and 2,4'-DDD.  
[3] Sum of bromoform, bromoethane (methylbromide), chloromethane (methyl chloride), chlorodibromomethane, and dichlorobromomethane.  
[4] Sum of acenaphthylene, anthracene, 1,2-benzanthracene, 3,4-benzofluoranthene, benzo[k]fluoranthene, 1,1,2-benzoperylene, benzo[a]pyrene, chrysene, dibenzo[a,h]anthracene, fluorine, ideno[1,2,3-cd]pyrene, phenanthrene, and pyrene.  
[5] Sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260.

**E. Land Discharge Specifications – Not Applicable**

**F. Recycling Specifications – Not Applicable**

**V. RATIONALE FOR RECEIVING WATER LIMITATIONS**

**A. Surface Water**

Receiving water quality is a result of many factors, some unrelated to the discharge. This Order considers these factors and is designed to minimize the influence of the discharge on the receiving water. Receiving water limitations for Discharge Point No. 001 to the Pacific Ocean are consistent with the water quality objectives contained in the Ocean Plan and Basin Plan, and are retained from the previous Order.

**B. Groundwater – Not Applicable**

**VI. RATIONALE FOR PROVISIONS**

**A. Standard Provisions**

Standard Provisions, which apply to all NPDES permits in accordance with 40 C.F.R. section 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 C.F.R. section 122.42, are provided in Attachment D to the order.

Sections 122.41(a)(1) and (b) through (n) of 40 C.F.R. establish conditions that apply to all State-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. Section 123.25(a)(12) allows the State to omit or modify conditions to impose more stringent requirements. In accordance with 40 C.F.R. section 123.25, this Order omits federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

**B. Special Provisions**

**1. Reopener Provisions**

The Order may be modified in accordance with the requirements set forth at 40 C.F.R. 122 and 124, to include appropriate conditions or limits based on newly available information, or to implement any new State water quality objectives that are approved by the U.S. EPA. As effluent is further characterized through additional monitoring, and if a need for additional effluent limitations becomes apparent after additional effluent characterization, the Order will be reopened to incorporate such limitations.

**2. Special Studies and Additional Monitoring Requirements**

**a. Toxicity Reduction Requirements**

The Order contains the requirement to perform a TRE, if chronic toxicity limitation is exceeded. When toxicity monitoring measures toxicity in the effluent above a whole effluent toxicity effluent limitation established by the Order, the Discharger is required to resample and retest. When all monitoring results are available, the Executive Officer can determine whether to initiate enforcement action, whether to require the Discharger to implement TRE requirements, or whether other measures are warranted.

**b. Effluent Bacteria Evaluation**

To evaluate potential impacts on human health and assist in public health determinations, the Order contains requirements to conduct monitoring when effluent limitations for total coliform bacteria are exceeded in consecutive monitoring events. The Discharger shall conduct near shore and surf zone monitoring for bacteria in accordance with section VIII.A of the Monitoring and Reporting Program. Results of the increased monitoring for bacteria shall be summarized and submitted in a report to the Executive Officer.

### **3. Best Management Practices and Pollution Prevention**

#### **a. Pollution Prevention Program**

A Pollution Prevention Program is a regulatory program administered by the Discharger to prevent the introduction of pollutants into the Facility which will interfere with the operation of the treatment works, pass through the treatment facility, reduce opportunities to recycle and reuse municipal wastewater and sludge, or expose the Facility employees to hazardous chemicals. Although a 301(h) waiver was not applied for or granted to the Discharger, the Facility is anticipated to continue to operate as it has under previous 301(h) waivers, and is unable to provide full secondary treatment to all effluent discharged from the Facility. Thus, this permit continues to implement pollution prevention requirements specified in 40 C.F.R. Part 125.66(d) in lieu of the general pretreatment regulations specified in 40 C.F.R. Part 403.

#### **b. Pollutant Minimization Program**

The 2015 Ocean Plan establishes requirements for a Pollutant Minimization Program (PMP) to reduce all potential sources of a pollutant through pollutant minimization control strategies. This Order implements the requirements of section III.C.9 of the Ocean Plan.

### **4. Construction, Operation, and Maintenance Specifications**

The Facility shall be operated as specified under Standard Provisions, Attachment D.

### **5. Special Provisions for Municipal Facilities (POTWs Only)**

#### **a. Biosolids Management**

The use and disposal of biosolids is regulated under federal and State laws and regulations, including permitting requirements and technical standards included in 40 C.F.R. 503. The Discharger is required to comply with the standards and time schedules contained in 40 C.F.R. 503.

Title 27, CCR, Division 2, Subdivision 1, section 20005 establishes approved methods for the disposal of collected screenings, residual sludge, biosolids, and other solids removed from liquid wastes. Requirements to ensure the Discharger disposes of solids in compliance with State and federal regulations have been included in this Order.

### **6. Other Special Provisions**

#### **a. Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (State Water Board Order No. 2006-003-DWQ).**

The Order requires coverage by and compliance with applicable provisions of General Waste Discharge Requirements for Sanitary Sewer Systems (State Water Board Order No. 2006-003-DWQ). This General Permit, adopted on May 2, 2006, is applicable to all "federal and state agencies, municipalities, counties, districts, and other public entities that own or operate sanitary sewer systems greater than one

mile in length that collect and/or convey untreated or partially treated wastewater to a publicly owned treatment facility in the State of California.” The purpose of the General Permit is to promote the proper and efficient management, operation, and maintenance of sanitary sewer systems and to minimize the occurrences and impacts of sanitary sewer overflows.

## VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

40 C.F.R. section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the Central Coast Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP), Attachment E, establishes monitoring and reporting requirements that implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this facility.

### A. Influent Monitoring

In addition to influent flow monitoring, monitoring for BOD<sub>5</sub> and TSS is required to determine compliance with the Order’s 85 percent removal requirement for these pollutants. Influent monitoring requirements have been retained from the previous Order.

### B. Effluent Monitoring

Effluent monitoring is necessary to determine compliance with effluent limitations and evaluate compliance with applicable water quality objectives and criteria. Effluent monitoring requirements from the previous Order for Discharge Point No. 001 are retained in this Order, with some exceptions.

The previous Order established an effluent limitation for acute toxicity, but did not require monitoring. Due to the procedures in Appendix VI of the Ocean Plan, and State and federal anti-backsliding regulations, the effluent limitation for acute toxicity has been carried over to this Order. Acute toxicity monitoring requirements have not been added, based on the use of the more sensitive chronic toxicity monitoring required and initial dilution of 133:1.

Although the effluent limitations for chronic toxicity was retained due to the determination of reasonable potential for various Ocean Plan Table 1 parameters, the MEC for chronic toxicity was 31.2 TUc. This is significantly less than the applicable WQBEL of 134 TUc. Thus, due to the limited risk to exceed the applicable WQBEL, the monitoring frequency for chronic toxicity has been reduced from semiannual to annual.

Monitoring for Ocean Plan Table 1 metals and non-metals for protection of marine aquatic life without reasonable potential was established as once per year. This reduces the monitoring frequency from semiannual to annual.

Monitoring of the parameters for protection of human health without reasonable potential was established as once per permit term. This is consistent with other ocean discharge permits within the region.

Because ammonia did not demonstrate reasonable potential to exceed water quality objectives, the monitoring for ammonia was reduced from monthly to annually. Because the data is not necessary to evaluate compliance with applicable water quality objectives,

monitoring for nitrate, urea, orthophosphate, and dissolved silica was reduced from semiannual to annual.

### **C. Whole Effluent Toxicity Testing Requirements**

See the previous section regarding monitoring frequencies for chronic toxicity. WET limitations protect receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. Chronic toxicity testing is conducted over a longer period of time and may measure mortality, reproduction, and/or growth. Accelerated monitoring requirements have been established in the attached MRP in order to confirm the presence of toxicity in the effluent prior to implementation of TIE and TRE procedures.

### **D. Receiving Water Monitoring**

#### **1. Surface Water**

Surf zone monitoring is conducted to assess bacteriological conditions in areas used for body-contact sports (e.g., surfing) and where shellfish may be harvested for human consumption and to assess aesthetic conditions for general recreational uses (e.g., picnicking, boating, etc.).

Ocean monitoring is necessary to evaluate the impacts of the discharge on the receiving water and to determine compliance with surface water limitations.

Surface water receiving water monitoring requirements have been reduced to annually, consistent with the Discharger's demonstrated compliance and consistent with other ocean discharge permits within the region.

Water column surveys have been removed from this permit based on consistent compliance with surface water limitations, analysis of previous water column surveys, planned upgrades to full secondary treatment, and consistent with other municipal wastewater treatment facilities permitted to discharge to ocean waters in the Central Coast region.

#### **2. Groundwater – Not Applicable**

### **E. Other Monitoring Requirements**

#### **1. Benthic Monitoring**

Benthic monitoring is necessary to assess the temporal and spatial occurrence of pollutants in local marine sediments and to evaluate the physical and chemical quality of the sediments in relation to the outfall. This Order decreases the frequency of benthic sampling from annual to once per permit based on the Facility upgrade to full secondary treatment, previous monitoring results, and consistent with other similar municipal wastewater treatment facilities permitted to discharge to ocean waters in the Central Coast region. Monitoring is required in the first year of the permit in order to maintain a continuous dataset with previous monitoring.

#### **2. Biosolids Monitoring**

Biosolids monitoring shall be reported in the annual report in accordance with 40 C.F.R. 503. Biosolids monitoring requirements are similar to the previous Order.

### 3. Ocean Outfall Inspection

This Order retains the requirement of the previous Order to conduct annual visual inspections of the outfall and diffuser structure and provide a report of this inspection to the Central Coast Water Board regarding the system's physical integrity.

## VIII. PUBLIC PARTICIPATION

The Central Coast Water Board considered the issuance of WDRs that will serve as an NPDES permit for the City of Morro Bay/Cayucos Sanitary District Wastewater Treatment Plant. As a step in the WDRs adoption process, Central Coast Water Board staff developed tentative WDRs and encouraged public participation in the WDR adoption process.

### A. Notification of Interested Parties

The Central Coast Water Board notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and provided an opportunity to submit written comments and recommendations. Notification was provided through publication in the local paper and posting in Discharger's City Hall.

The public had access to the agenda and any changes in dates and locations through the Central Coast Water Board's web site at:  
<http://www.waterboards.ca.gov/centralcoast/>

### B. Written Comments

Interested persons were invited to submit written comments concerning tentative WDRs as provided through the notification process. Comments were encouraged to be sent via email to [centralcoast@waterboards.ca.gov](mailto:centralcoast@waterboards.ca.gov). Comments may also have been submitted in person, or by mail, to the Executive Office at the Central Coast Water Board at:

Central Coast Water Board  
895 Aerovista Place, Suite 101  
San Luis Obispo, CA 93401-7906

To be fully responded to by staff and considered by the Central Coast Water Board, the written comments were due at the Central Coast Water Board office by 5:00 p.m. on **November 6, 2017**.

The Central Coast Water Board received written comments from the City of Morro Bay on November 6, 2017, as follows below. Water Board staff's response to comments is provided as well.

- 1. Provide additional time to review an administrative draft of the pending time schedule order.** We understand a time schedule order with interim limits will be prepared to address compliance with the new permit. We are concerned that some of the monitoring requirements are not consistent with a secondary treatment permit and may carry over to a permit for the new facility. We respectfully request sufficient time for the City to review an administrative draft of the pending time schedule order.

**Staff response:** Water Board staff will be working closely with Discharger to develop realistic milestones and compliance dates for the pending time schedule order. Water Board staff intends to have the time schedule order implemented prior to the effective date of this permit.

2. **Update the Draft Permit to conform to the current Ocean Plan.** The Draft Permit cites objectives from the 2012 California Ocean Plan. However, that plan has been superseded by the 2015 Ocean Plan. The Tentative Order (Draft Permit) should revise its requirements to conform to the current Ocean Plan.

**Staff Response:** Corrections have been made.

3. **Cite a Consistent Annual Report Due Date of April 1.** The Draft Permit contains conflicting dates for the submission of the Annual Monitoring Report, including January 30 (Page D-13), February 1 (Table E-12), and April 1 (Page E-26). We request the various references to an annual monitoring report submission deadline be revised to reflect an April 1 deadline. Only the April 1st deadline is tenable. That date is consistent with the Current Permit's submission deadline requirement. Earlier submission dates would be difficult to achieve. The data collection, laboratory processing of field samples, and analysis of instrumental data are sequential and require a finite amount of time. Many of these steps can only be initiated after the beginning of the year. An earlier deadline would leave little time for assimilating and reporting on the results, and the quality and scope of the final report would suffer greatly.

**Staff Response:** Annual monitoring report expectation is April 1<sup>st</sup>; corrections have been made for consistency.

4. **Eliminate the Cat-Litter Public-Outreach Program.** The Draft Permit retains a nebulous cat-litter requirement that is an outdated relic of the previous permit-renewal process conducted a decade ago. This problematic permit requirement has been the subject of considerable criticism in every annual monitoring report since the current permit was approved (See Pages 2-17, 2-18, and 3-9 in <http://www.morro-bay.ca.us/Archive.aspx?ADID=2757> and prior annual reports posted on the City of Morro Bay Website since 2009). As discussed in those reports, we request elimination of this requirement for the following reasons.
  - a) The requirement arose out of a Section 7 consultation with the USFW service by the EPA as part of their biological evaluation of current 301(h)-modified permit. The new Draft Permit is not 301(h) modified, and therefore EPA and USFW evaluations and Section 7 consultations are no longer part of the regulatory process. Consequently, there is no mechanism for those regulatory agencies to address new scientific information and revisit the original Cat-Litter requirement.
  - b) Shortly after final approval of the current MBCSD permit in 2009, results from a comprehensive field study (Johnson et al. 2009) were published that confirmed that disease vectors unrelated to WWTP discharge are responsible for the observed *T. gondii* exposure in otters, and that the epicenter for sea otter infection is not within Estero Bay. As such, there is no longer any scientific rationale for continuation of a dedicated outreach program specific to cat-litter disposal in the MBCSD collection system.
  - c) None of the other regional ocean dischargers have a similar requirement, including the recently approved permits for Goleta, Avila, and Carpinteria. It is not as though the MBCSD is the only ocean discharger with cats located within its collection area, or that have southern sea otters within its receiving waters.
  - d) Numerous nebulous requirements dealing with cat litter are included in multiple locations within the Draft Permit (Pages 20, E-27, F-7, F-40, and F-41). The

annual requirements for “implementation goals...work plans...quantifiable measures for goals...descriptions of actions taken...reevaluations with adequate justification” are vague and make quantitative evaluation of compliance with the requirement unattainable.

**Staff Response:** Water Board staff concurs with Discharger’s comments and has reviewed the data from the annual reports submitted. Since the time of the original cat-litter public outreach program, the Central Coast Water Board has shifted similar programs to NPDES stormwater programs, when the programs are deemed necessary. Consistent with this practice for other areas in the Central Coast region, we will remove the cat-litter program from this permit and the stormwater program would be the appropriate regulatory program, if deemed necessary.

**5. Eliminate the Acute Toxicity Requirement.** A requirement for an annual acute toxicity test was added to the Draft Permit apparently because the Current Permit did not require that test and therefore, an RPA could not be performed (Page F-31). However, the acute toxicity test requirement was specifically excluded from the Current Permit for a variety of reasons. All of those same reasons apply to the Draft Permit. Specifically, ammonia interference introduces substantial inaccuracy in reported test results, and there is no technical or regulatory rationale for requiring acute toxicity testing of MBCSD effluent. For the following reasons, we request elimination of the acute toxicity testing requirement from the effluent monitoring requirements (Table E-3 on Page E-56). Alternatively, if inclusion of some form of acute testing requirement is deemed necessary, the requirement for conducting an acute test should be triggered by an elevated chronic test result that exceeds 90% (120 TUc) of the effluent limit. At a minimum, given the great uncertainty in the reported acute toxicity results, all Toxicity Reduction Requirements should only be based on a chronic toxicity triggering level, and not a trigger related to the acute bioassay results. Much of the rationale for eliminating the acute toxicity monitoring requirement was presented during the development of the current discharge permit, and has been presented in annual monitoring reports prior to 2009 (see Pages 2-38 thru 2-41 of the 2008 Annual Report available at: <http://www.morro-bay.ca.us/Archive.aspx?ADID=124>). Some of the major points are summarized below.

- a) The Draft Permit fact sheet [Page F-31] correctly states that the California Ocean Plan (COP) requires chronic toxicity testing for dischargers when dilution is between 100:1 to 350:1, but does not acknowledge that the COP also states that acute tests are discretionary within that dilution range. In fact, at 133:1, the MBCSD discharge is at the lower end of that range, and for dischargers with slightly lower dilutions, below 100:1, acute testing is not required under any circumstances.
- b) Acute testing is unnecessarily redundant when chronic testing is also required as part of the WDRs because chronic tests provide far more accurate and sensitive measures of effluent toxicity. In Functional Equivalent Documents supporting the COP, State Board “Staff agrees that critical life stage tests are more sensitive indicators of receiving water impacts than acute toxicity tests.”
- c) Acute tests conducted on MBCSD effluent during prior permit cycles have resulted in highly erroneous measures of toxicity that provided no insight into the actual toxicity of the discharge. Over two decades of acute testing prior to the current permit have demonstrated that the presence of ammonia in the MBCSD effluent samples severely compromises the accurate determination of acute toxicity.
- d) Even within these past artificially elevated acute-toxicity measurements, the reported acute toxicity of the MBCSD discharge has been less than half of the more-stringent effluent limitation cited in the WDRs of that period. Consequently,

even the past artificially inflated acute-toxicity values cannot be considered a threat to beneficial uses.

- e) The acute toxicity limit is intended to prevent lethality to organisms passing through the acute mixing zone. For the MBCSD discharge, the prescribed mixing zone is highly localized around the outfall, and extends only 1.5 m (4.9 ft) from the point of discharge. Field measurements collected at that distance within MBCSD discharge jets show that the effluent had already been diluted more than 100-fold, which is 25-times more dilute than the effluent tested in the bioassays. The only conceivable beneficial use that could be impacted within that narrow zone would be fishing. However, finfish are likely to avoid the turbulent discharge jet. Acute toxicity tests continuously expose organisms over a four-day period and do not reflect the brief duration of any potential finfish exposure.

**Staff Response:** Water Board staff has reviewed the existing Order's permitting history with regards to acute toxicity testing requirements. The existing permit's Fact Sheet (page F-36) provided Staff Response 6 regarding the removal of acute toxicity monitoring requirement. The same conditions still apply. Chronic toxicity testing is a more sensitive and accurate measure of whole effluent toxicity than acute toxicity. In this case, with an initial dilution of 133:1, chronic toxicity testing provides adequate protection of beneficial uses. Acute toxicity testing is unnecessary. Staff has removed the acute toxicity monitoring requirement.

- 6. **Reduce the Monitoring Frequency for Cyanide and TCDD Equivalents.** Based on an RPA conducted on a limited dataset collected 3 years ago, the Draft Permit established monitoring frequencies for cyanide of twice per year and a TCDD equivalents (dioxin) monitoring frequency of once per year. However, the RPA finding that these two constituents have a reasonable potential to exceed water-quality objectives is an artifact of uncertainty introduced by the limited time span of the datasets. Attachment A to the comment letter contains the RPA input and results for a more representative 14-year dataset spanning the period from 2004 thru 2017. Analysis of that data conclusively determines an RPA endpoint of 2, indicating that an effluent limitation is not required for those pollutants. We request the monitoring frequency for cyanide and TCDD equivalents be reduced to once in the life of the permit.

**Staff Response:** Water Board staff reviewed the updated reasonable potential analysis for cyanide and TCDD provided by the Discharger. The data supports an endpoint of 2, and therefore similar to other endpoint 2 pollutants, an effluent limitation is not required for those pollutants, and the frequency of monitoring has been changed to similarly grouped parameters with endpoint 2 (once per permit term).

- 7. **Remove the effluent nutrient monitoring requirement.** A provision for nutrient monitoring was incorporated into the Current Permit to address concerns regarding the MBCSD's potential nutrient contribution to the generation of harmful algal blooms offshore central California. However, chemical analyses on nitrate, urea, orthophosphate, and silica that were conducted in every annual report produced in the current permit cycle, demonstrate unequivocally that nutrient concentrations within the MBCSD effluent, and their mass loading to the marine environment from its discharge, are miniscule compared to both other central-coast dischargers, and the contribution from regional streams and rivers. These nutrient comparisons are provided in Section 2.2.11 on Pages 2-32 thru 2-34 and on Pages 5-9 and 5-10 of 2015 Annual Report available at: <http://www.morro-bay.ca.us/Archive.aspx?ADID=2757>. Some of that discussion is summarized below. We request that the effluent nutrient monitoring requirement (nitrate, urea, orthophosphate, and dissolved silica in Table E-3 on Page E-5 of the draft permit) be removed.

- a) In contrast to the other effluent parameters, there are no effluent limits associated with these four nutrients and therefore, they have no bearing on compliance assessments.
- b) Nutrient loading from the MBCSD WWTP is several orders-of-magnitude lower than both runoff and discharge from other central-coast WWTP's, and far smaller than the nutrient loading from naturally occurring processes such as upwelling.
- c) Additionally, it is clear that nutrient loads from the MBCSD discharge are unrelated to the frequency or intensity of the algal blooms occurring along this stretch of coastline. Consequently, continued nutrient monitoring provides no scientifically valid or usable information relevant to the prediction or management of algal blooms, and should be discontinued.
- d) Other, much larger central coast dischargers are no longer required to monitor for nutrients and it is unreasonable to impose this additional requirement only on the MBCSD discharge.

**Staff Response:** Water Board staff does not recommend revisions to the draft permit based on Discharger's comments. Nutrient discharge and loading continues to be a concern in the region, and other municipal wastewater treatment plants are monitoring for nutrient discharges. The nutrient monitoring data continues to provide value to potential impacts to the discharge environment.

- 8. Reduce the requirements for offshore benthic surveys and eliminate the requirement for water-column surveys.** The requirement for annual offshore benthic and water-column surveys is not warranted for a variety of reasons. We request that the requirement for water-column surveys be eliminated, and the frequency of benthic surveying be reduced to once-in-the-life of the permit. Justification and discussion is provided below.
- a) The offshore benthic and water-column surveys are labor intensive to conduct and time consuming to analyze, and as a result, are far more expensive than end-of-pipe chemical assays.
  - b) The months of effort expended on these offshore surveys will not result in monitoring program that is more protective of the marine environment than achieved by the routine onshore effluent monitoring already implemented in the permit. End-of-pipe monitoring provides an immediate and easily-interpreted assessment of potential marine impacts that may result from a decline in effluent quality. In contrast, offshore monitoring requires complex analyses to determine the presence of long-term changes in a highly variable marine environment.
  - c) The quarter-century of data already amassed by the MBCSD offshore monitoring program has never indicated any marine impacts from the discharge. It is highly unlikely that continued offshore monitoring of similar intensity will result in a different finding.
  - d) The proposed offshore monitoring program is more intensive than that of other dischargers of similar or larger discharge volume. For example, as with most small ocean dischargers, the new Goleta permit does not require offshore water-column surveys, and limits the benthic sampling to once-in-the-life of the permit. This level of monitoring is also appropriate for the MBCSD discharge given that its flow is four-times smaller, its offshore dilution is 10% greater, and it services a less-industrialized collection area.
  - e) The small volume of effluent discharged by the MBCSD is much higher quality than that achieved by primary treatment alone because the majority of effluent receives secondary treatment. TSS and BOD concentrations within the MBCSD discharge are the only effluent constituents that may occasionally slightly exceed

full-secondary standards, but because of the limited discharge volume, TSS and BOD loading to the environment is similarly limited. Moreover, the MBCSD discharge volume has declined in recent years and additional declines are expected when the Cayucos treatment plant is commission next year.

- f) The Draft MBCSD Permit is no longer covered by Section 301(h) of the Clean Water Act, and as such, it not legally subject to the intensive offshore monitoring program specifically mandated in that section of the Federal Regulations. From a regulatory standpoint, it is inconsistent to impose these exhaustive monitoring requirements when the other 301(h) provisions were eliminated in the Draft Permit.

**Staff Response:** Water Board staff agrees with the Discharger's comments regarding the conclusions from the existing, intensive monitoring program. The comprehensive data set gathered during the previous Orders' offshore monitoring programs do not indicate an impact from the discharge on the marine environment. Additionally, since the Facility will no longer operate with a 301(h) waiver, reducing the monitoring to requirements consistent with other facilities within the region is supported. Monitoring requirements have been changed accordingly.

- 9. **Correct the effluent concentration and loading limits for heptachlor and Heptachlor epoxide in Table 7 on Page 9, Table F-6 on Page F-13, and Table F14c on Pages F-29 and F-30.** The respective concentration limits should be 0.0067 µg/L and 0.00268 µg/L, and the loadings should be 1.15 x 10<sup>-4</sup> lbs/day and 4.6 x 10<sup>-5</sup> lbs/day. This request was made in Comment 32 of Attachment F – Fact Sheet for the current permit, but was never implemented in the final permit.

**Staff Response:** Water Board staff verified the units with the 2015 California Ocean Plan. The Discharger is correct regarding the values. Corrections have been made.

- 10. The City also requests the Regional Water Quality Control Board acknowledge the City is pursuing a recycled water program, and salt reduction in the collection system will be critical to reducing capital and operating cost for production of recycled water. Based on sampling conducted in June and July of 2015, the City estimated that brine from self-regenerating water softeners contributed 12% of total dissolved solids (TDS) and 19% of chlorides to wastewater treatment plant (WWTP) influent (January 5, 2016, Presentation to Water Reclamation Facility Citizens Advisory Committee).

**Staff Response:** The Central Coast Water Board encourages, consistent with the State Recycled Water Policy, communities to plan for maximizing the extent of recycled water production and use. Water Board staff will continue to work with Dischargers to encourage and facilitate recycled water projects, including the City of Morro Bay.

### C. Public Hearing

The Central Coast Water Board held a public hearing on the proposed WDRs during its regular Board meeting as follows:

Date: December 7, 2017  
Time: 8 am – 5 pm  
Location: Central Coast Water Board  
895 Aerovisa Place, Suite 101

San Luis Obispo, CA 93401

Interested persons were invited to attend. At the public hearing, the Central Coast Water Board offered to hear testimony, pertinent to the discharge, WDR's, and permit. For accuracy of the record, important testimony is requested in writing. The item was considered on the consent calendar. Mr. Rob Livick from the City of Morro Bay Public Works Department provided a brief update on the City's activities presented in the Staff Report for this item. No members of the public requested comment, or was any provided.

**D. Reconsideration of Waste Discharge Requirements**

Any aggrieved person may petition the State Water Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be received by the State Water Board at the following address within 30 calendar days of the Regional Water Board's action.

State Water Resources Control Board  
Office of Chief Counsel  
P.O. Box 100, 1001 I Street  
Sacramento, CA 95812-0100

For instructions on how to file a petition for review, see:

[http://www.waterboards.ca.gov/public\\_notices/petitions/water\\_quality/wqpetition\\_instr.shtml](http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml)

**E. Information and Copying**

The Report of Waste Discharge, other supporting documents, and comments received are on file and may be inspected at the address above at any time between 8:00 a.m. and 5:00 p.m., Monday through Friday. Copying of documents may be arranged through the Central Coast Water Board by calling (805) 549-3147.

**F. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Central Coast Water Board reference this Facility, and provide a name, address, and phone number.

**G. Additional Information**

Requests for additional information or questions regarding this order should be directed to Katie DiSimone at (805) 542-4638 ([Katie.disimone@waterboards.ca.gov](mailto:Katie.disimone@waterboards.ca.gov)) or Sheila Soderberg at (805) 549-3592 ([Sheila.soderberg@waterboards.ca.gov](mailto:Sheila.soderberg@waterboards.ca.gov)).

# Appendix E: Architectural Space Needs Outline

# Morro Bay Water Reclamation Facility

## ARCHITECTURAL SPACE NEEDS OUTLINE

### OPERATIONS BUILDING

Provide an operations and administration building that will provide workspace for up to sixteen employees. Include three private office spaces, a control room/operations center with work spaces for thirteen employees (not necessarily all at the same time), a map storage and copy room, a break/training room, a conference room, sufficient gender-neutral showers and restrooms, uniform storage, an electrical room, a server room, and a janitorial/mechanical room.

#### Administration

| Space Function                           |
|------------------------------------------|
| Three Private Offices (Manager plus two) |

#### Operations

| Space Function           | Notes                                    |
|--------------------------|------------------------------------------|
| Control Room-OPS Center  | Work stations for up to 8 simultaneously |
| Map/Copy-Work Room       |                                          |
| Two Sample Storage Rooms | Access from exterior                     |

#### Support Spaces

| Space Function                         | Notes                       |
|----------------------------------------|-----------------------------|
| Training-Break Room                    |                             |
| Storage Room                           |                             |
| Conference Room                        |                             |
| Gender-Neutral Restrooms               | Adjacent to Uniform storage |
| Gender-Neutral Locker Room and Showers |                             |
| Uniform Storage (Lockers)              |                             |
| Server Room                            |                             |
| Janitor-Mechanical Room                |                             |
| Electrical Room                        |                             |

### SHOP/MAINTENANCE BUILDING

Provide a shop/maintenance building that will provide an open shop/storage area with drive through bay for service vehicles, plus a laboratory, restroom, instrumentation and controls (I&C) workshop, and a satellite operations room.

| Space Function                                    |
|---------------------------------------------------|
| Shop and Storage Space                            |
| I + C Workshop                                    |
| Restroom                                          |
| Laboratory – for process, not regulatory lab work |
| Satellite Operations Room                         |

**RE: Lead Building Inspection - Morro Bay Wastewater Treatment Facility, 160 Atascadero Road,  
Morro Bay, California**

## INTRODUCTION

This report presents the findings of West Coast Safety Consultants inspection for lead containing building materials at the Morro Bay Wastewater Treatment Facility located at 160 Atascadero Road, Morro Bay, California on August 28, 2010. The inspection was conducted for CAL-OSHA and EPA compliance in conjunction with the renovation of the structure. All accessible areas were visibly inspected and representative samples of suspect materials were obtained and analyzed. Samples were not collected from every painted surface, however samples were obtained which represent the majority of the painted surfaces inside and outside the buildings.

## LEAD SAMPLE ANALYSIS

Our survey involved a visual inspection of each structure and sample collection from painted surfaces and ceramic tile. There were 34 samples analyzed by Forensic Analytical Specialties using Flame Atomic Absorption in accordance with the Environmental Protection Agency (EPA) Method (3050B/7420) to identify lead content. Forensic Analytical Specialties, Incorporated is a laboratory which is certified to analyze for lead. They are accredited by the American Industrial Hygiene Association, the National Institute of Standards and Technology, and the California Department of Public Health (CDPH). Please note the attached laboratory report.

## LEAD FINDINGS

West Coast Safety Consultants visual inspection indicated the ceramic tile and painted surfaces inside and outside the building were generally intact, and in good condition, however flaking and peeling paint was observed in the following areas:

1. Administration and Boiler Building's exterior parapet cap.
2. Upper Head Works Building exterior equipment.
3. Old Chlorine Building exterior fascia boards.

Thirty (30) paint samples and four (4) ceramic tile samples were collected and analyzed for lead content. The results in parts per million (ppm) are as follows:

| <u>Sample #</u> | <u>Location</u>                         | <u>Description</u> | <u>Lead Content</u> |
|-----------------|-----------------------------------------|--------------------|---------------------|
| MB-101          | Administration Building Wall            | Blue Paint         | None Detected       |
| MB-102          | Administration Building Ceiling         | White Paint        | None Detected       |
| MB-103          | Administration Building Door            | Brown Paint        | 1,400 ppm           |
| MB-104          | Administration Building Door Frame      | Blue Paint         | 630 ppm             |
| MB-105          | Administration Building Door Frame      | Beige Paint        | 3,300 ppm           |

| MB-133          | Old Chlorine Building Exterior Fascia | Beige Paint        | 150 ppm             |
| MB-134          | Old Chlorine Building Exterior I-Beam | Beige Paint        | 80 ppm              |

As a comparison, the EPA and CDPH consider a material to be lead based paint when it exceeds .5% or 5,000 ppm. In addition, the Consumer Product Safety Commission (CPSC) set a limit of .009% or 90 ppm of lead in paint for children's toys and CAL-OSHA regulates workers who disturb lead coated surfaces at any detectable lead level.

Lead based paint was detected on the blue painted metal door in the Administration Building and the yellow painted hoist located outside the Upper Headworks Building. The yellow painted hoist located in the Boiler Building and the Old Chlorine Building were not sampled and therefore should be assumed to contain lead in excess of 5,000 ppm. The paint on all of those surfaces was intact and in good condition. No lead hazards were detected on the inspection.

The remaining painted surfaces contained no lead or relatively low levels of lead in the paint. The painted metal doors throughout the facility contained 630 - 4,600 ppm lead. The grey painted pipe, equipment, light posts and stairways contained up to 230 ppm lead.

No lead was detected in the ceramic tile located in the Administration Building or the interior and exterior painted walls and ceilings on all of the buildings except the Old Chlorine Building which contained 80-150 ppm lead on the exterior painted surfaces.

Although the majority of painted surfaces are below the EPA and CDPH threshold of 5,000 ppm lead, the paint still contains levels of lead, which when disturbed, trigger compliance with the CAL-OSHA regulations. Contractors disturbing painted surfaces or ceramic tile should receive notification of the lead content and the condition of the painted surfaces prior to demolition, renovation, or any activity which would disturb the material. **All work should be conducted in compliance with the CAL-OSHA and EPA regulations.**

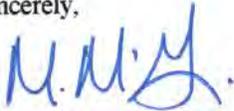

## CLOSURE

The findings and conclusions rendered in this report are based on the scope of work authorized by the client and laboratory analysis of building material samples collected during this inspection. This report does not reflect variations which may exist between sampling points. These variations can not be anticipated, nor could they be entirely accounted for even with exhaustive testing. All work has been performed in accordance with generally accepted practices in the field of lead consultation.

The conclusions and recommendations listed in this report are based on the requirements set forth in the Department of Housing and Urban Development Interim Guidelines for Lead-based Paint, 40 CFR Part 61, National Emission Standards for Hazardous Air Pollutants (NESHAP), and Section 1532.1 the Lead Standard of the California Occupational Safety and Health Administration.

I have enclosed the required CDPH notification of a Lead Inspection, a sample location diagram, a laboratory report from Forensic Analytical and a copy of my lead credentials. If you have any questions, please contact me at 805-748-8832. Thank you for choosing West Coast Safety Consultants.

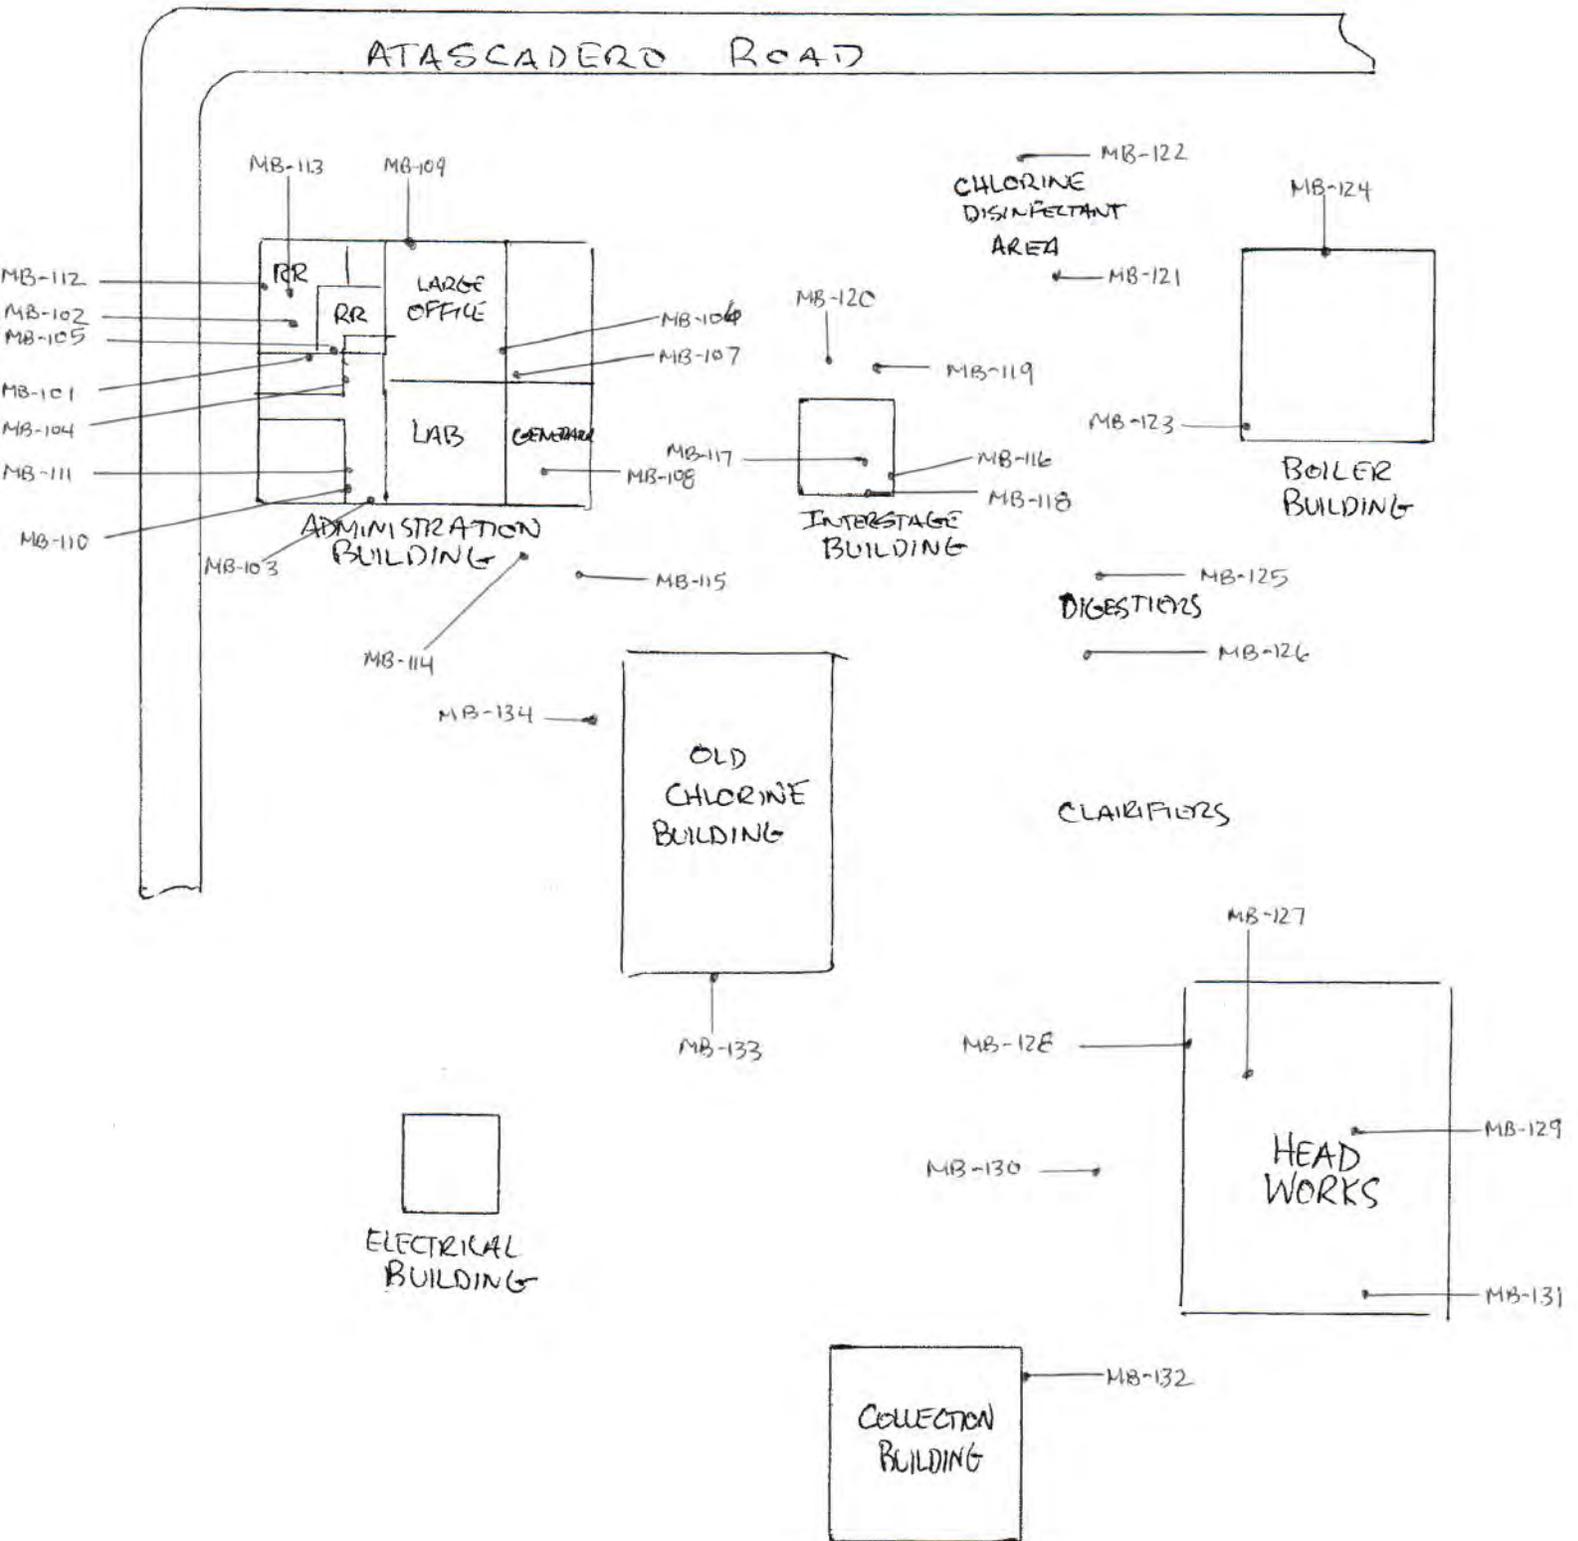

Sincerely,

A handwritten signature in blue ink, appearing to read "M. M. G.", with a stylized flourish at the end.

Michael Mc Guire, CSP  
Lead-Related Construction Certificate #379

**RE: Asbestos Building Inspection - Morro Bay Wastewater Treatment Facility, 160 Atascadero Road, Morro Bay, California**

## INTRODUCTION

This report presents the findings of West Coast Safety Consultants inspection for asbestos containing building materials at the Morro Bay Wastewater Treatment Facility, 160 Atascadero Road, Morro Bay, California on August 28, 2010. All accessible areas were visibly inspected and samples of suspect material were obtained and analyzed.

Our survey involved sampling and analyzing suspect materials to test for the presence of asbestos. A detailed description of the work is outlined below.

1. Inspected all accessible areas of the building for Category I Non-friable, Category II Non-friable, and other Regulated Asbestos Containing Materials. Samples were collected recording:
  - a. Sample location
  - b. Sample description
  - c. Friability
  - d. Condition of the material
  - e. Potential for disturbance
  
2. Submitted samples to an EPA accredited laboratory which will provide a report containing the following:
  - a. West Coast Safety Consultants sample identification number
  - b. Laboratory sample identification number
  - c. Analytical technique
  - d. Quality control procedures
  - e. Type and percentage of asbestos in each material

3. Analyzed the sample results and generated this report which includes:
  - a. Definitions
  - b. Executive Summary
  - c. Findings
  - d. Conclusions and Recommendations
  - e. Sample Result Summary (Appendix A)
  - f. Sample Location Diagram (Appendix B)
  - g. Laboratory Report (Appendix C)
  - h. Inspectors Credentials (Appendix D)

## **DEFINITIONS**

### **Asbestos**

Types of asbestos include chrysotile, amosite, crocidolite, tremolite, anthophyllite, actinolite and any of these minerals that have been chemically treated and/or altered.

### **Asbestos Containing Material (ACM)**

Means any material containing more than one percent asbestos.

### **Category I Non-friable ACM**

Asbestos containing packings, gaskets, resilient floor coverings, and asphalt roofing products containing more than 1 percent asbestos as determined using the method specified in Appendix A, Subpart F, 40 CFR Part 763, Section 1, Polarized Light Microscopy (PLM).

### **Category II Non-friable ACM**

Any non-friable material, excluding Category I Non-friable ACM, containing more than 1% asbestos as determined using PLM.

### **Friable ACM**

Any material containing more than 1% asbestos as determined using PLM that when dry can be crumbled, pulverized, or reduced to powder by hand pressure.

### **NESHAPS**

The National Emission Standards for Hazardous Air Pollutants (40 CFR Part 61).

### **Regulated Asbestos Containing Material (RACM)**

Any material containing more than 1% asbestos which is:

- a. Friable or;
- b. Category I Non-friable ACM that has become friable or;
- c. Category I Non-friable ACM that will be or has been subjected to sanding, grinding, cutting, abrading or;
- d. Category II ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to a powder by the forces expected to act on the material in the course of demolition.

## EXECUTIVE SUMMARY

### **MATERIALS WHICH CONTAIN ASBESTOS:**

**Floor Tile** located in the administration building contains a trace (less than 1%) chrysotile asbestos.

**Tar** located around the roof penetrations and patches on all of the buildings contain 5% chrysotile asbestos.

**Transite Panels** located in the fume hood in the administration building contain 20% chrysotile asbestos.

### **SUSPECT MATERIALS WHICH NO ASBESTOS WAS DETECTED:**

**Baseboard Mastic** located in administration building was sampled and no asbestos was detected.

**Plaster** located on the interior walls in the administration building was sampled and no asbestos was detected in any of the samples.

**Drywall/Joint Compound** located in the attic area of the administration building and the boiler building restroom was sampled and no asbestos was detected in any of the samples.

**Drop-in Ceiling Panel** located in the administration building was sampled and no asbestos was detected.

**Rolled Shingle/Tar and Felt Roofing Materials** located on all of the buildings was sampled and no asbestos was detected in any of the samples.

**Putty** located on the roof parapet of the administration building was sampled and no asbestos was detected.

**Pipe Gaskets** located throughout the facility were sampled and no asbestos was detected in any of the samples.

**Stucco** located on the exterior walls of the administration building and the boiler building was sampled and no asbestos was detected in any of the samples.

## FINDINGS

West Coast Safety Consultants collected samples of each suspect asbestos containing building material (ACBM) encountered at the specific site location. The Environmental Protection Agency (EPA) sampling protocol was utilized which requires multiple samples of suspect asbestos containing materials which are applied by spraying or troweling. A total of 34 samples were submitted to Forensic Analytical Services, Inc., an EPA accredited laboratory for analytical testing. Laboratory results are found in appendix C of this report. The asbestos samples were analyzed for the presence of asbestos by Polarized Light Microscopy (PLM) with dispersion staining in accordance with the EPA Method 600/R-93-116, Visual Area Estimation.

Of the 34 samples that were analyzed for asbestos, four (4) were found to contain asbestos. The location of these samples, their description, and our recommended solution to mitigate any potential hazards emanating from contact with these materials is as follows:

**Sample Number:** MB-01

**Sample Description:** Floor Tile/Mastic

**Location of Material:** Throughout Administration Building

**Quantity of Material:** Approximately 600 Square Feet

**Type and % Asbestos:** Trace (<1%) Chrysotile (In Floor Tile Only)

**NESHAP Classification:** Not regulated because the material contains less than 1% asbestos.

**Overall Condition:** The material is intact and in good condition.

**Disturbance Potential:** Slight, because the material is very resilient.

**Recommended Response:** This material should be maintained in good condition and removed prior to demolition, renovation, or any activity which would disturb the material by an asbestos abatement contractor that is licensed by the State of California. Do not sand, cut, saw or abrade the material.

**Inspectors Note:** The County Air Pollution Control District requires additional sample analysis to verify sample results which are less than 1% asbestos. If additional analysis is not conducted, the floor tile should be assumed to contain greater than 1% asbestos and classified as a Category I Non-friable Asbestos Containing Material.

**Sample Number:** MB-10

**Material Description:** Transite Panel

**Location of Material:** Administration Building Fume Hood

**Quantity of Material:** Approximately 15 Square Feet

**Type and % Asbestos:** 20% Chrysotile

**NESHAP Classification:** Category II Non-Friable Asbestos Containing Material

**Overall Condition:** The material was intact and in good condition.

**Disturbance Potential:** Slight, because the material itself is very resilient.

**Recommended Response:** This material should be maintained in good condition and removed prior to demolition, renovation, or any other activity which would disturb the material by an asbestos abatement contractor that is licensed by the State of California. Do not sand, saw, or abrade the material.

|                               |                                                                                                                                                                                                                                                                                    |

| <b>Disturbance Potential:</b> | Slight, because the material itself is very resilient.                                                                                                                                                                                                                             |
| <b>Recommended Response:</b>  | The material should be maintained in good condition and removed prior to demolition, renovation, or any other activity which would disturb the material by an asbestos abatement contractor that is licensed by the State of California. Do not sand, saw, or abrade the material. |
| <b>Inspectors Note:</b>       | In several areas the tar tested negative for asbestos, however the two positive sample results require us to treat all the tar located around the roof penetrations and patches as asbestos containing material until additional sampling proves otherwise.                        |

## **CONCLUSIONS AND RECOMMENDATIONS**

The asbestos containing materials identified in this report are intact and in good condition. Intact and undisturbed asbestos containing building materials do not pose a health risk to the building occupants. Disturbing the material improperly however, could expose the building occupants to airborne asbestos fibers. West Coast Safety Consultants recommends all the asbestos containing materials identified in this report be maintained in their current condition and be removed prior to demolition, renovation or any activity which could disturb those materials by an asbestos abatement contractor licensed by the State of California. If additional suspect materials are discovered during demolition or renovation activities, the material should be assumed to contain asbestos until sampling proves otherwise.

Estimated quantities of asbestos containing material identified in this report are intended as estimates only. Prior to removal of asbestos containing materials, West Coast Safety Consultants recommends the contractor make a thorough site investigation to independently ascertain the actual quantities prior to submitting a price quote.

These conclusions and recommendations are based on the requirements set forth in 40 CFR Part 61, National Emission Standards for Hazardous Air Pollutants (NESHAP), and Title 8, Chapter 4, Paragraph 1529, the Asbestos Standard of the California Occupational Safety and Health Administration.

## **CLOSURE**

The findings and conclusions rendered in this report are opinions based on the scope of work authorized by the client and laboratory analysis of building material samples collected during this inspection. This report does not reflect variations which may exist between sampling points. These variations can not be anticipated, nor could they be entirely accounted for, in spite of exhaustive additional testing. Our work has been performed in accordance with generally accepted practices in the field of asbestos consultation. No other warranty, either expressed or implied is made.

Although every effort is made to identify all the asbestos containing materials in a building, it is possible for asbestos containing materials which are located under sub-floors, behind walls or otherwise hidden from view to go undetected until demolition or renovation activities uncover the material. If additional suspect materials are discovered, West Coast Safety Consultants will collect samples and provide a report for no additional cost other than the laboratory fee for sample analysis.

The County Air Pollution Control District requires additional sample analysis to verify sample results which are less than 1% asbestos. If additional analysis is not conducted, the material should be assumed to contain greater than 1% asbestos. Please notify West Coast Safety Consultants with-in three weeks of receiving this report if you require additional sample analysis. An additional laboratory fee of \$120 will be charged for each sample analyzed by the Point Count Method.

Enclosed with this report are copies of my credentials and a laboratory report from Forensic Analytical Services. We appreciate this opportunity to be of service. Should you have any questions or comments regarding this report, please contact this office at your convenience.

West Coast Safety Consultants,

Michael Mc Guire, CSP  
Certified Asbestos Consultant (#92-0534)

## ASBESTOS SAMPLE RESULT SUMMARY

| <b><u>Sample #</u></b> | <b><u>Material</u></b> | <b><u>Location</u></b>            | <b><u>Asbestos Content</u></b> |
|------------------------|------------------------|-----------------------------------|--------------------------------|
| MB-01                  | Floor Tile             | Administration Building           | Trace (<1%) Chrysotile         |
| MB-02                  | Baseboard Mastic       | Administration Building           | None Detected                  |

| Total Composite Values of Fibrous Components: |            | <b>Asbestos (ND)</b> |                  |               |                  |               |                  |
| Cellulose (Trace)                             |            |                      |                  |               |                  |               |                  |

James Flores, Laboratory Supervisor, Hayward Laboratory

Note: Limit of Quantification ('LOQ') = 1%. 'Trace' denotes the presence of asbestos below the LOQ. 'ND' = 'None Detected'.

Analytical results and reports are generated by Forensic Analytical Laboratories Inc. (FALI) at the request of and for the exclusive use of the person or entity (client) named on such report. Results, reports or copies of same will not be released by FALI to any third party without prior written request from client. This report applies only to the sample(s) tested. Supporting laboratory documentation is available upon request. This report must not be reproduced except in full, unless approved by FALI. The client is solely responsible for the use and interpretation of test results and reports requested from FALI. Forensic Analytical Laboratories Inc. is not able to assess the degree of hazard resulting from materials analyzed. FALI reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified. All samples were received in acceptable condition unless otherwise noted.

# Appendix M: Anticipated Environmental Mitigation Measures

## Anticipated Mitigation Measures Morro Bay WRF Onsite Improvements

All anticipated mitigation measures and plans are the responsibility of the DB unless noted specifically otherwise. The City or consultants retained by the City will perform required monitoring and surveys, or as identified below.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Geologic Resources</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Prior to the approval of building plans for each proposed facility, the design of each facility shall be based on a facility-specific geotechnical report prepared by a California registered geotechnical engineer and professional geologist. The geotechnical report shall provide seismic data for use with at least the minimum requirements of the California Building Code.                                                                                                                                                                                                                                                                                                |
| Prior to approval of the improvement plans for the proposed facilities, a geotechnical report that addresses liquefaction hazards shall be prepared by the DB and approved by the City of Morro Bay. The geotechnical report shall state the recommended actions for the collection system and treatment plant site so that potential impacts from seismically-induced liquefaction would be reduced to less than significant.                                                                                                                                                                                                                                                    |
| Prior to approval of improvement plans, an Emergency Response Plan (ERP) shall be prepared. The ERP shall recognize the potential for liquefaction, seismic hazards and ground lurching to impact proposed facilities, and specific high hazard areas shall be inspected for damage following an earthquake. "Soft Fixes" shall be incorporated in the ERP. Soft Fixes typically consist of having a plan in-place to address the hazards, such as can be achieved by storing supplies and equipment for repair.                                                                                                                                                                  |
| Prior to the approval of grading plans, erosion control measures shall be incorporated into the grading plans to minimize the potential for erosion or loss of top soil during grading.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Prior to the approval of grading plans, vegetation/landscaping shall be provided on the graded cut and fill slopes to reduce the long-term potential for soil erosion or loss of topsoil.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Prior to the approval of grading plans for each facility, the plans shall provide for the control of surface water away from slopes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Prior to approval of the improvement plans for the proposed facilities, a geotechnical report that addresses the potential for lateral spreading, ground subsidence, and ground lurching and provides measures to reduce potential impacts to less than significant shall be prepared and approved.                                                                                                                                                                                                                                                                                                                                                                               |
| Prior to approval of improvement and building plans for the proposed facilities, a design-level geotechnical report shall be prepared that addresses and reduces potential expansive soil impacts to less than significant. The expansive soil data shall be used with the requirements of the California Building Code.                                                                                                                                                                                                                                                                                                                                                          |
| <b>Biological Resources</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Impacts to Trees. It is anticipated at this time that all trees could be avoided by the project, and those within 25 feet of the limits of disturbance will have protective measures put in place to ensure they remain uninjured during the course of construction. An attempt will be made to protect the minimum distance of 1.5 times the dripline (i.e., the distance from the trunk to the outermost limits of leaves and branches). During development, orange construction fencing or sufficient staking to identify the protection area will surround each tree or clusters of trees. Protection fencing and staking areas will also be shown on all construction plans. |
| If grading or trenching must encroach within the dripline of protected trees, the activity will attempt to avoid soil compaction and damage to the critical root zone as much as possible. Tree protection and compensatory mitigation for impacted trees will follow current City policies that will be outlined in the arborist report.                                                                                                                                                                                                                                                                                                                                         |
| Rare Plants. The facility site contains two occurrences of the San Luis Obispo owl's clover, a CRPR List 1B species, that are outside the proposed development footprint. Native bunchgrass grasslands observed on portions of the facility site are also outside the development footprint, and would not be impacted by the proposed project. The                                                                                                                                                                                                                                                                                                                               |

Cambria morning glory is present in annual grasslands. If these would be impacted by the project, a Rare Plant Habitat Mitigation Program should be developed and implemented. To fully mitigate impacts to special status plants that may occur from project construction, the following mitigation is required:

1. If a special status plant population(s) is located in the construction area and project redesign is not feasible to avoid the occurrence, a rare plant mitigation plan should be developed to ensure a no-net-loss of special status plant species and their habitat. The rare plant mitigation plan should be developed by a qualified botanist/restoration ecologist in consultation with the City, CDFW and USFWS, as appropriate. The special-status plant species mitigation program should at a minimum include the following:
  - The overall goal and measurable objectives of a no-net loss of special status species in the mitigation and monitoring plan;
  - Specific areas for re-vegetation and their size. Potential sites for mitigation would be any suitable site in close proximity to the impact area;
  - Specific habitat management concepts to be used during the establishment period (i.e., annual population census surveys and habitat assessments for the period immediately following construction; establishment of monitoring reference sites; a seasonally-timed weed abatement program; and seasonally-timed seed collection, propagation, and reintroduction of special-status plant species into specified receiver sites);
  - Success criteria based on the goals and measurable objectives to ensure that a viable population(s) is established on the project site; and
  - Reporting requirements to ensure consistent data collection and reporting methods used by monitoring personnel.
2. Prior to construction, all rare plant occurrences within or adjacent to impact areas will be flagged for avoidance. If development cannot avoid the rare plants, rare plants will be salvaged from the disturbance area where feasible, and relocated to appropriate habitat outside the development footprint. Salvage and relocation activities will include the collection of seed and/or propagules prior to grading activities. Seed will be hand broadcasted into areas of suitable habitat outside the development area, or incorporated into the native grassland erosion control seed mix.
3. Monitoring will occur annually for five years to ensure successful establishment of all re-introduced or salvaged plants and that no-net-loss of the species occurs. In the case of annual plants it can be difficult to determine if there has been a net loss or gain of a viable population in a five-year period. Therefore, reference sites will be used to the extent possible to extrapolate trends in a species' population dynamics. An adaptive management program will also be included to address both foreseen and unforeseen circumstances relating to the preservation and mitigation programs. The program will also include remedial measures to address negative impacts to the special- status plant species and their habitats (i.e., removal of weeds, additional seeding/planting efforts) if the species or its habitat is suffering a net loss at the time of the follow up surveys.
4. All grassland areas disturbed by construction that are outside the WRF facility will have an approved seed mix applied through either direct hand seeding or hydroseeding methods.

Wetland/Riparian Habitat Impacts. The following mitigation measures should be implemented prior to and during construction. The DB may be able to avoid some or all of these permits by siting facilities outside impact areas:

1. During the project planning phase, the City will initiate consultation with regulatory agencies to determine which regulatory permits will be necessary. The type of permits and compensatory mitigation required will depend on the proposed project impacts associated with the chosen pipeline alignment and proposed construction methods, and may likely include a Section 404 Permit from USACE, a Section 401 Water Quality Certification from RWQCB, and a Section 1602 Streambed Alteration Agreement from CDFW. The City, or consultants retained by the City, will complete applications for these specific permits if required.

2. Once the project development footprint and construction methods have been finalized, the drainage impact areas can be calculated and impacts to federal and state jurisdictional areas can be determined. To compensate for impacts to riparian and wetland habitat and non-wetland drainage features, a Habitat Mitigation and Monitoring Plan (HMMP) should be prepared. The HMMP should be consistent with federal and state regulatory requirements and local City policies. The HMMP should be submitted with permit applications for agency approval. The City would then be required to implement the HMMP during construction and immediately following project completion for an estimated period of five years.
3. Prior to start of construction activities, the contractor in coordination with the City should retain a qualified biological monitor to ensure compliance with all permit requirements and avoidance and minimization measures (i.e.: preconstruction surveys, worker environmental training, and construction monitoring) during work within and adjacent to drainage features.
4. Prior to start of construction, the project boundaries adjacent to drainages should be clearly flagged or fenced so that contractors are aware of the limits of allowable site access and disturbance. Areas to be preserved should be clearly flagged as off-limits to avoid unnecessary damage and potential erosion.
6. Prior to issuance of construction permits, an Erosion Control Plan incorporating up to date Best Management Practices should be prepared by the project engineer to minimize impacts to aquatic habitats. The plan should address installation and maintenance of both temporary and permanent measures to control erosion and dust, contain spills, protect stockpiles, and generally maintain good housekeeping practices within the worksite. All project plans should show that erosion, sediment, and dust control measures must be installed prior to start of any ground disturbing work. All bare or disturbed soil areas that are outside the developed facility and roadway areas will be seeded with an approved native erosion control seed mix.
7. All applicable plans should clearly show project stockpile and materials staging areas. These areas should be at least 50 feet from drainage features, active storm drain inlets, and must conform to BMPs applicable for storm drain protection.
8. Prior to start of work, the contractor should prepare and implement a Spill Prevention Plan to ensure prompt and effective response to any accidental spills. All workers shall be informed of the importance of preventing spills and of the appropriate measures to take should a spill occur. All project-related hazardous materials spills within the project site should be cleaned up immediately. Spill prevention and cleanup materials should be on-site at all times during the course of the project.
9. All refueling, maintenance, and washing of equipment and vehicles should occur on impervious areas in a location where a spill would not travel onto bare ground or to a storm drain inlet. This fueling/staging area will conform to BMPs applicable to attaining zero discharge of stormwater runoff. At a minimum, all equipment and vehicles must be checked and maintained on a daily basis to ensure proper operation and avoid potential leaks or spills. Washing of equipment should occur only in a location where polluted water and materials can be contained for subsequent removal from the site.
10. A designated concrete washout location should be established onsite, in an area at least 50 feet from any drainage or storm drain inlet. The washout should be maintained and inspected weekly, and will be covered prior to and during any rain event. Concrete debris should be removed whenever the washout container reaches the 1/2 full mark.
11. BMP's for dust abatement shall be a component of the project's construction documents. Dust control requirements should be carefully implemented to prevent

water used for dust abatement from transporting pollutants to storm drains leading to the creek channel.

12. During project activities, all trash that may attract predators shall be properly contained, removed from the work site, and disposed of regularly. Following construction, all trash and construction debris shall be removed from work areas.

Nesting Birds. Project activities, including equipment use during demolition, initial vegetation removal and construction activities, and associated noise, vibration, and dust, could impact nesting migratory birds and/or special-status bird species in riparian willow habitat, street trees, and grassland habitats within the study area.

*Recommended Mitigation.* The following mitigation measures are recommended to avoid or minimize impacts to nesting bird species, including special status species and species protected by the Migratory Bird Treaty Act.

1. Any removal of trees and disturbance of annual grassland habitat should be limited to the time period between September 1 and February 14 if feasible. If tree removal and grassland impacts cannot be conducted during this time period, a qualified biologist should conduct pre-construction surveys for active bird nests within the limits of the project.
2. If active nest sites of bird species protected under the Migratory Bird Treaty Act and/or California Fish and Game Code Section 3503 are observed within or adjacent to the study area, then the project should be modified and/or delayed as necessary to avoid direct take of the identified nests, eggs, and/or young. Potential project modifications may include establishing appropriate “no activity” buffers around the nest site. Construction activities should not occur in the buffer until the project biologist has determined that the nesting activity has ceased.
3. If active nest sites of raptors and/or bird species of special concern are observed within the vicinity of noise or vibration producing project activities, an appropriate buffer around the nest site (250 to 500 feet for raptors depending on location) should be implemented. Construction activities in the buffer zone should be prohibited until the young have fledged the nest and achieved independence.
4. Active nests should be documented and monitored by the project biologist, and a letter report should be submitted to the USFWS and CDFW, documenting project compliance with the MBTA and applicable project mitigation measures.

American Badger. The American badger was determined to have potential to occur on the facility site, due to presence of grassland habitats, water, and a prey base of California ground squirrels and pocket gophers in the general region. A pre-construction survey for active badger dens should be conducted within the construction impact footprint and surrounding accessible areas of the study area at least two weeks prior to any ground disturbing activities. The survey should be conducted by a qualified biologist. In order to avoid potential direct impacts to adults and nursing young, no grading should occur within 50 feet of an active badger den as determined by the project biologist. Construction activities between July 1 and February 28 should comply with the following measures to avoid direct take of adult and weaned juvenile badgers through the forced abandonment of dens:

1. A qualified biologist should conduct a focused survey at least two (2) weeks prior to the start of construction;
2. The survey should cover the entire area proposed for development;
3. If a potential den is located that is too long to see the end, a fiber optic scope (or other acceptable method such as using tracking medium for a three night period) should be used to determine if the den is being actively used by a badger;

4. Inactive dens should be excavated by hand with a shovel or using a small excavator to prevent badgers from re-using them during construction.
5. Badgers should be discouraged from using currently active dens prior to the grading of the site by partially blocking the entrance of the den with sticks, debris and soil for three to five days. Access to the den should be incrementally blocked to a greater degree over this period. This should cause the badger to abandon the den and move elsewhere. After badgers have stopped using any den(s) within the project boundary, the den(s) should be hand-excavated with a shovel or carefully excavated with the use of an excavator to prevent re-use.
6. The qualified biologist should be present during the initial clearing and grading activity. If additional badger dens are found, all work should cease until the biologist can complete measures described above for inactive and active dens. Once the badger dens have been excavated, work on the site may resume.

**Cultural and Paleontological Resources**

Complete Area of Potential Effect (PAE) for potential cultural resources within the study area and conduct Phase 1 review within that area. Implement the recommendations of that Phase 1 review as appropriate. The prescriptive mitigation will be fully established through the EIR being prepared for the project.

If previously unidentified cultural materials are unearthed during construction, the disposition of such a find must follow state law. As part of this, work shall be halted in that area until a qualified archaeologist can assess the significance of the find. Additional archaeological survey will be needed if project limits are extended beyond the present survey limits, and for associated access roads and the pipeline.

Prepare a Phase 2 Work Plan for resource recovery, if needed to address the recommendations of any Phase I activities, and implement it as needed.

If human remains are encountered within the project area, the City shall be responsible for complying with provisions of Public Resources Code Sections 5097.98 and 5097.99, and 7050.5 of the California Health and Safety Code, as amended by Assembly Bill 2641, and coordinate such activities with the County, the entity responsible for permitting of the facility. Restrictions or procedures for excavation, treatment, or handling of human remains shall be established in consultation with the individuals designated by the Native American Heritage Commission as the Most Likely Descendants.

Although unlikely, should any vertebrate fossils or potentially significant finds (e.g., numerous well-preserved invertebrate or plant fossils) be encountered by anyone working on the site, all activities in the immediate vicinity of the find are to cease until a qualified paleontologist evaluates the find for its scientific value. If deemed significant, the paleontological resource(s) shall be salvaged and deposited in an accredited and permanent scientific institution where they will be properly curated and preserved for the benefit of current and future generations.

**Hazards and Hazardous Materials**

Prior to any onsite construction activities at the proposed treatment plant site, soils shall be sampled and analyzed by a licensed engineer or geologist approved by the County of San Luis Obispo Health Department to determine the level of residue for pesticides, herbicides, chemicals, and associated metals. If residues are found to be within acceptable amounts per the San Luis Obispo County Health Department (SLOCHD) and Environmental Protection Agency/Department of Toxic Substance Control (DTSC) standards then grading and construction may begin. If the residue is found to be greater than the SLOCHD and DTSC standards, all contaminated soils exceeding the acceptable limits shall be remediated and/or properly disposed of per SLOCHD and DTSC requirements. An appropriate verification closure letter from SLOCHD and DTSC shall be obtained and submitted to the County of San Luis Obispo Planning Department. Depending on the extent of contaminated soils, a verification closure letter from the California Regional Water Quality Control Board may also need to be submitted to the County of San Luis Obispo Planning Department. Site remediation can occur by the use of on-site transportable thermal treatment units or bio-remediation. The soil can also be excavated and shipped off-site to fixed incineration or bioremediation facilities.

Prior to operation of the wastewater project, a Hazardous Materials Management Plan shall be developed and submitted to the County of San Luis Obispo Environmental Health Services Division for approval. The plan shall identify hazardous materials utilized at the proposed wastewater facilities and their characteristics; storage, handling, training procedures, and spill contingency procedures. Additionally, the Hazardous Materials Management Plan shall identify procedures in the event of accidents such as

the release of raw wastewater or secondary treated water into watercourses such as the adjacent drainage. These procedures shall include immediate response personnel to limit public access to spill areas, potentially shutting down pump stations, creating berms, use of vacuum trucks, and use of water booms to contain spills within open water areas.

Furthermore, the Plan shall address response and containment of fuel at pump stations sites, when used.

#### **Traffic and Circulation**

Prior to construction, a traffic management plan shall be prepared for review and approval by the City of Morro Bay. The Plan will address construction traffic as needed, including for the WRF and pipelines. With respect to the WRF, the plan must address site access. For the pipelines, the plan must address potential temporary road closures associated with pipelines that may be laid within road rights of way.

The plan shall be based on the type of roadway, traffic conditions, duration of construction, physical constraints, nearness of the work zone to traffic and other facilities (bicycle, pedestrian, driveway access, etc.). The traffic management plan shall include:

- a) Advertisement. An advertisement campaign informing the public of the proposed construction activities should be developed. Advertisements should occur prior to beginning work and periodically during the course of project construction. Advertisements to be prepared by DB and reviewed/distributed by City.
- b) Property Access. Access to parcels along the construction area shall be maintained to the greatest extent feasible. Affected property owners shall receive advance notice of work adjacent to their property access and when driveways would be potentially closed.
- c) Schools. Any construction adjacent to schools shall ensure that access is maintained for vehicles, pedestrians, and bicyclists, particularly at the beginning and end of the school day.
- d) Buses, Bicycles and Pedestrians. The work zone shall provide for passage by buses, bicyclists and pedestrians.
- e) Intersections. Traffic control (i.e. use of flag men) shall be used at intersections that are determined to be unacceptably congested due to construction traffic.

#### **Air Quality**

Prior to issuance of grading permits, the contractor in coordination with the City shall submit a Construction Activities Management Plan for the review and approval of the SLOAPCD. This plan shall include but not be limited to the following Best Available Control Technologies for construction equipment:

- a. Minimize the number of large pieces of construction equipment operating during any given period.
- b. Schedule construction related truck/equipment trips during non-peak hours to reduce peak-hour emissions.
- c. Properly maintain and tune all construction equipment according to manufacturer's specifications.
- d. Fuel all off-road and portable diesel powered equipment including but not limited to: bulldozers, graders, cranes, loaders, scrapers, backhoes, generators, compressors, auxiliary power units, with CARB motor vehicle diesel fuel.
- e. Use 2007 or newer heavy duty off road vehicles to the extent feasible.
- f. Use Caterpillar pre-chamber diesel engines (or equivalent) together with proper maintenance and operation to reduce emissions of NOX.
- g. Electrify equipment where possible.
- h. Use Compressed Natural Gas (CNG), liquefied natural gas (LNG), biodiesel, or propane for on-site mobile equipment instead of diesel- powered equipment.

Prior to initiating grading activities, the contractor in coordination with the City shall:

- a. Include the following specifications on all project plans: One catalyzed diesel particulate filter (CDPF) shall be used on the piece of equipment estimated to generate the greatest emissions. If a CDPF is unsuitable for the potential equipment to be controlled, five diesel oxidation catalysts (DOC) shall be used.
- b. Identify equipment to be operated during construction as early as possible in order to place the order for the appropriate filter and avoid any project delays. This is necessary so that contractors bidding on the project can include the purchase, proper installation, and maintenance costs in their bids.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <p>c. Contact the SLOAPCD Compliance Division to initiate implementation of this mitigation measure at least two months prior to start of construction.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p>Prior to initiating grading activities, if it is determined that portable engines and portable equipment would be utilized, the contractor in coordination with the City shall contact the SLOAPCD and obtain a permit to operate portable engines or portable equipment, and shall be registered in the statewide portable equipment registration program. The SLOAPCD Compliance Division shall be contacted in order to determine the requirements of this mitigation measure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p>Project contract documents will include the following dust control measures:</p> <ol style="list-style-type: none"> <li>a. Reduce the amount of the disturbed area where possible,</li> <li>b. Use water trucks or sprinkler systems in sufficient quantities to prevent airborne dust from leaving the site. Increased watering frequency will be required whenever wind speeds exceed 15 mph. Reclaimed (non-potable) water should be used whenever possible.</li> <li>c. All dirt stockpile areas will be sprayed daily as needed.</li> <li>d. Permanent dust control measures identified in the revegetation and landscape plans will be implemented as soon as possible following completion of any soil disturbing activities.</li> <li>e. Exposed ground areas that are planned to be reworked at dates greater than one month after initial grading will be sown with a fast germinating native grass seed and watered until vegetation is established.</li> <li>f. All disturbed soil areas not subject to revegetation will be stabilized using approved chemical soil binders, jute netting, or other methods approved in advance by the APCD.</li> <li>g. All roadways, driveways, sidewalks, etc. to be paved will be completed as soon as possible. In addition, building pads will be laid as soon as possible after grading unless seeding or soil binders are used.</li> <li>h. Vehicle speed for all construction vehicles will not exceed 15 mph on any unpaved surface at the construction site.</li> <li>i. All trucks hauling dirt, sand, soil, or other loose materials are to be covered or will maintain at least two feet of freeboard (minimum vertical distance between top of load and top of trailer) in accordance with CVC Section 23114.</li> <li>j. Install wheel washers where vehicles enter and exit unpaved roads onto streets, or wash off trucks and equipment leaving the site.</li> <li>k. Sweep streets at the end of each day if visible soil material is carried onto adjacent paved roads. Water sweepers with reclaimed water should be used where feasible.</li> <li>l. If visible emissions of fugitive dust persist beyond a distance of 200 feet from the boundary of the construction site, all feasible measures shall be implemented to eliminate potential nuisance conditions at off-site receptors (e.g., increase frequency of watering or dust suppression, install temporary wind breaks where appropriate, suspend excavation and grading activity when winds exceed 25 mph).</li> <li>m. The contractor will designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite. Their duties will include holidays and weekend periods when work may not be in progress. The name and telephone number of such persons will be provided to the SLOAPCD prior to the start of construction.</li> </ol> |

**Subject: Geologic Report on Conceptual Proposed Employee Housing Project, Sea Shell  
Community Retirement Facility, Morro Bay, Assessor's Parcel Number 068-041-006**

Dear Mr. Woodle:

Per your request and in accordance with our proposal of January 30, 2007, Cleath & Associates has reviewed your concept drawings for the proposed employee housing at the Sea Shell Community Retirement Facility and the site geology to identify geologic hazards that could be significant in the design and construction of these structures. The outline of this report follows the checklist prepared for engineering geology and seismology reports by the California Geologic Survey (publication Note 48).

## **PROJECT LOCATION**

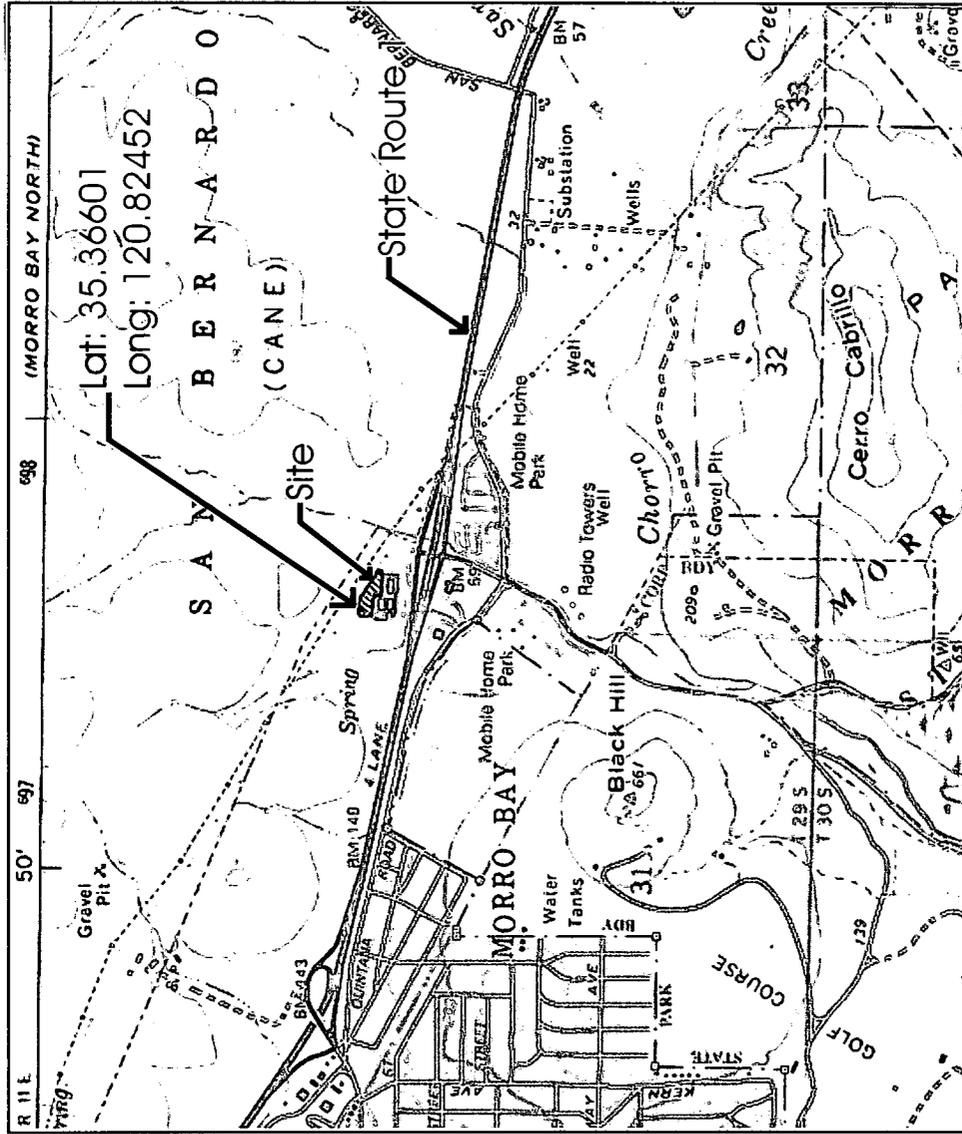

### **Location**

The proposed project is located behind the existing retirement home. The Sea Shell Community Retirement Facility is located at 1405 Teresa Drive near the end of South Bay Boulevard immediately adjacent to the north bound on-ramp to State Route 1. The site has the following coordinates: latitude 35.36601, Longitude: -120.82452 (Figure 1). The site lies within the city limits of the City of Morro Bay.

### **Project Description**

The proposed employee housing is comprised of 15 units situated on the slope behind the retirement facility and will be placed up-hill from the driveway and block retaining wall. Up-hill from the proposed housing there are high tension lines crossing the property. Existing grade rises from about 80 feet along the driveway to about 120 feet along the northern property boundary. The existing slope in the vicinity of units 1-8 is about 2:1 (H:V) and is 1:1 (H:V) in the vicinity of Units 9-15.

The project includes one and two story buildings that are single residences and duplexes that are planned to be constructed as slab-on-grade. Access would be by stairs and walkways to the existing driveway. Earthwork as determined for the existing plan will involve an estimated cut of 287 cubic yards and fill of

 Morro Bay

98 cubic yards. The lower eastern building area will have the structures benched into the existing slope with retaining walls serving as stem walls for the structures. The layout of the housing is shown on Figure 2.

## **ENGINEERING GEOLOGY**

### **Regional Geology**

The published regional geologic map for this area is the USGS Miscellaneous Field Studies Map MF 511, "Geologic Map of Morro Bay South and Port San Luis Quadrangles, San Luis Obispo County, California, 1973, by Clarence A. Hall (Figure 3). This map shows that the property is underlain by Franciscan melange and serpentinite.

### **Site Geology**

Cleath & Associates has mapped the geology of the property. A thin veneer of soil covers the bedrock geologic units underlying the project site, except where the slope has been cut back, where the bedrock units are exposed. The bedrock geology is clearly exposed in the cut behind the existing retaining wall. The geologic units exposed include primarily serpentinitic rock with a section of ultramafic and calc-silicate rocks located adjacent to Building Units 13 and 14. In the extreme eastern end of the proposed development area, there is an area of blueschist and chert beds but these rock types are east of the proposed building site and outside of the building envelopes. All of these rocks have been highly sheared and are weathered. The ultramafic/calc-silicate rock, however, are more heavily sheared. Figure 4, the Site Geologic Map, identifies the extent of the geologic units and the observed structural geologic features such as faults and major fractures and also the cross section lines..

### **Subsurface Geology**

Cleath & Associates has reviewed the six boring logs in the GSI Geotechnical Investigation report (dated February 16, 2007) that are located as shown on Figure 4. The borings encountered up to five feet of sandy clay on top of severely weathered bedrock. The bedrock was described in soils terminology and referred to as "severely weathered bedrock". The color description may be an indication of rock type, however. The gray to greenish gray colors in Borings 1 & 2 are typical of serpentinite and the yellowish brown color in Borings 3-6 is typical of the ultramafic/calc-silicate rock, but may be decomposed serpentinite or cherts. These rocks are tectonically emplaced and therefore cannot be correlated from one location to another without continuous trenching. The best existing definition of the relationships between these major rock units are in the cut hillside face adjacent to proposed Units 10-15. Further definition of underlying rock at each unit can be accomplished during grading and excavations for footings.

### **Geologic Cross Sections**

Seven cross sections have been drawn through the project area approximately perpendicular to the slope (Figure 5, Figure 6, Figure 7). Bedrock definition at each cross section is not possible at this time without trenching. The general character of the rock is noted, however. A photographic exhibit of the geologic section along the cut bank (Figure 8) provides a good visual illustration of the relationship of the two main rock types underlying the project site.

### **Active Faulting and Coseismic Deformation Across Site**

No known active vault or coseismic deformation is identified in published maps. No active faulting or coseismic deformation was noted during our geologic mapping of the site. No Alquist-Priolo fault zones underlie the site.

### **Geologic Hazard Zones**

The project site is not within an area of landslides or potential liquefaction based on County Safety Element maps. Figure 9 shows that the site is not in a County Designated "Geologic Study Area".

### **Landslides**

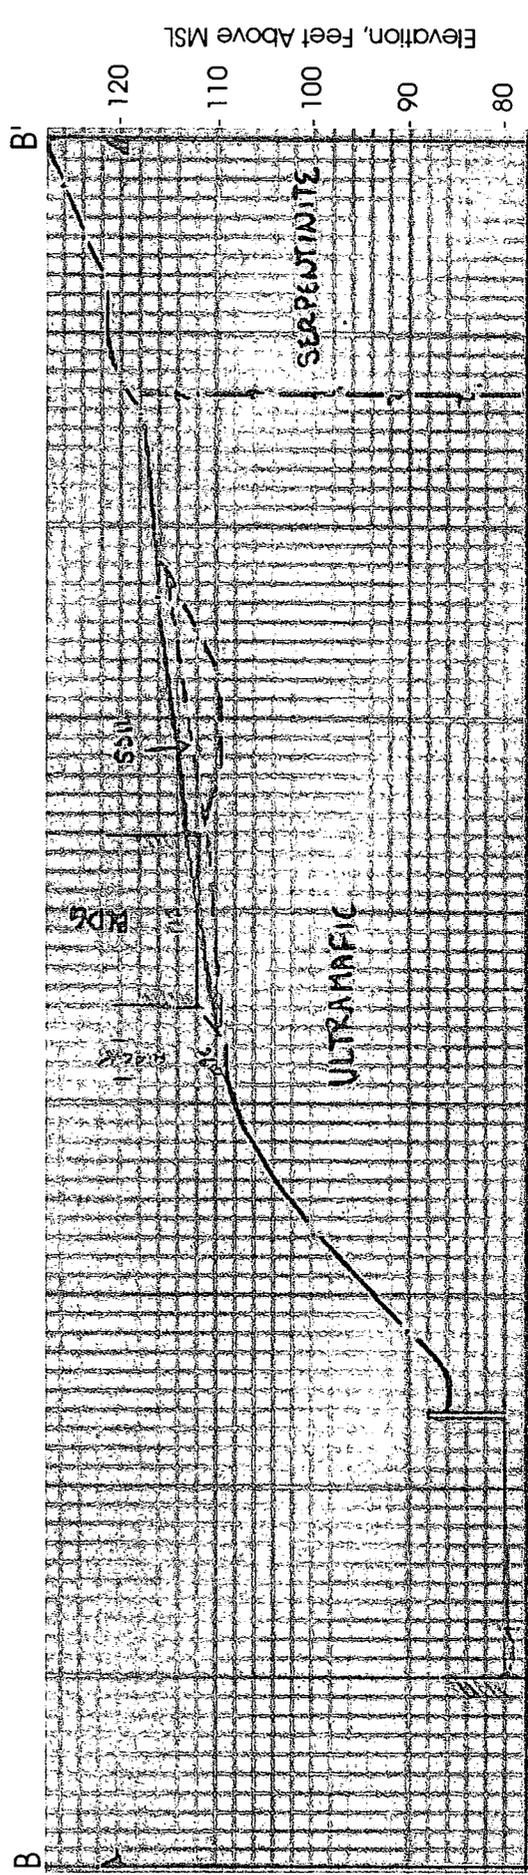

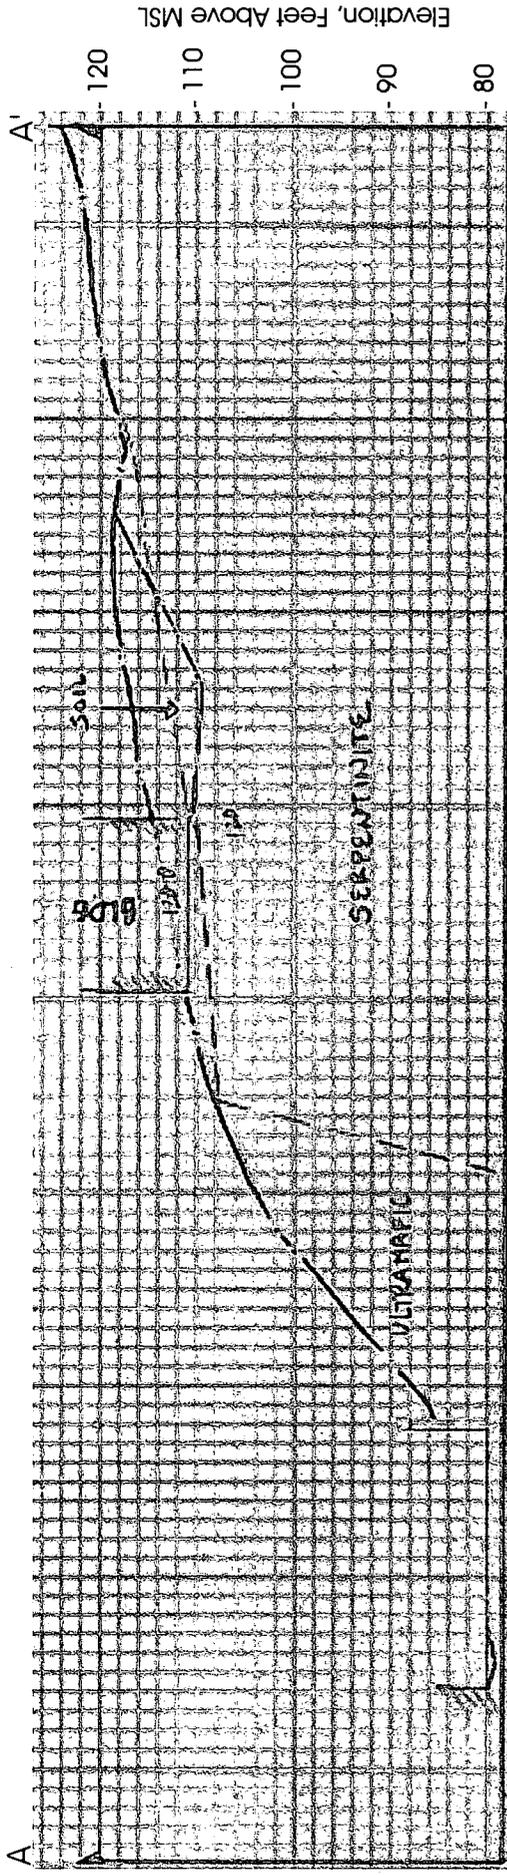

No known landslides are in the project area, nor are any up-hill or down-hill from the project area. The potential for slope failure is low based on the type of rock (massive serpentinite and ultramafic rock) and shallow soils underlying the project area. Ground water was not encountered to a depth of several feet below the finished floor level and no seeps were observed in the cut bank. Therefore, no slumps, rotational slides, rock falls, or debris flows are likely. Some rock fragments will erode out of the cut slopes, where exposed, but these are primarily a maintenance nuisance.

### **Slope Stability**

The relationship of the siting of the buildings to the slope is important to note, in light of the stability of the rock. The serpentinitic rock is firm and is stable at a 1:1 horizontal to vertical slope. The ultramafic/calc-silicate rock is not as firm and is more likely to be stable at a 1.5:1 (H:V). The structures located above the cut slope (Units 12-14) that are underlain by the ultramafics should be located so as to maintain a 1.5:1 (H:V). This would require that they be setback further from the existing slope than are shown on the existing conceptual plans.

### **Geotechnical Testing of Representative Samples**

GSI Soils has performed geotechnical testing of the soils and rock that are summarized in their February 16, 2007 report. The ring sample collected at three feet depth in Boring 1 had an initial dry density of 108.3 pounds per cubic foot, an initial moisture content of 13.3 percent. The peak shear angle was 41 degrees and the cohesion value was 380 pounds per square foot. The shear strength plot is shown in Appendix B of their report.

### **Expansive Soils**

The expansion index of the top soil ranges from 98 to 120 and of the bedrock is less than 20. As recommended in the geotechnical report, foundations should be placed into bedrock and the soils should be over-excavated below the slab and replaced with non-expansive soils or select material.

### **Geochemistry of Geologic Subgrade-Soluble Sulfates and Corrosive Soils**

Based on the rock types underlying the project area, no soluble sulfates are present. Soils underlying the buildings will be over-excavated and therefore corrosive soils are not a factor in this project.

### **Flooding and Severe Erosion**

The buildings are located up on a hill-side with limited watershed above the building areas and therefore major flooding should not be a problem. The shallow depth to bedrock that is resistant to erosion precludes severe erosion. This is exhibited in the existing cut slope. Drainage around the proposed residential units and down-slope should be controlled to avoid localized flooding at the driveway below the units.

### **Ground Water**

No ground water was encountered in the hand auger and drilled borings to their total depths. These borings were drilled to several feet below the finished floor elevations of the adjacent proposed housing units. No ground water was observed on the surface at the project site. These borings were drilled during a particularly dry winter, however. Some seeps may issue out of the shallow fractured rock during and following a wetter rainy season.

## **SEISMOLOGY AND CALCULATIONS OF EARTHQUAKE GROUND-MOTION**

### **Evaluation of Historic Seismicity**

Significant past earthquake epicenters are shown on Figure 10. Distances to known faults showing the maximum magnitude using the moment magnitude scale, are shown in Table 1.

### **Characterize and classify the geologic subgrade.**

The geologic subgrade was evaluated through subsurface exploration and surface mapping, and classified based on Table 16-J of the ICBO, 1997. The soil profile type C (very dense soil and soft rock) was determined for the site.

### **Probabilistic evaluation of earthquake ground motion.**

A probabilistic Seismic Hazard Analysis (PSHA) was conducted using the U.S. Geological Survey software "Seismic Design Parameters" to determine the design-basis earthquake (DBE) parameters.

### **Peak ground acceleration for DBE levels of ground motion.**

Section 1629.1 of the 1997 Uniform Building Code (ICBO, 1997) requires that the "design-basis ground motion" be provided in a geologic report. This is defined by the ICBO, 1997, as the ground motion with a 10% probability of exceedance in 50 years. Peak ground accelerations for the DBE represented by a

Cleath & Associates

response spectra were determined and are included in Appendix A (Seismic Parameters). The design basis ground motion for the site is 0.29 gravity (g). A spectral acceleration table is included in Appendix A

**Near-source coefficients and distance to nearest active fault.**

The near-source velocity factor (Nv) and the near-source acceleration factor (Na) were determined for the site using Tables 16-S and 16-T from the ICBO, 1997 (Appendix A). Using a distance of 7.2 kilometers from the site to the Los Osos fault (Type B fault), Nv is equal to 1.1, and Na is equal to 1.0. Table 16-Q of the ICBO, 1997 was used to determine the seismic coefficient Ca. Based on the Type C Soil Profile, the Na of 1.0, and the fact that the site is located within Seismic Zone 4, Ca is equal to 0.40. Table 16-R of the ICBO, 1997 was used to determine the seismic coefficient Cv. Based on the Type C Soil Profile, the Nv of 1.1, and the fact that the site is located within Seismic Zone 4, Cv is equal to 0.62.

**Seismic Zone 3 or 4**

The project site is located in Seismic Zone 4.

**LIQUEFACTION ANALYSIS**

This analysis is not applicable to this site due to the type of rock (massive serpentinite and ultramafic rock).

**EXCEPTIONAL GEOLOGIC HAZARDS AND COMPLICATED SITE CONDITIONS**

**Not Present at Site**

The following geologic hazards and complicated site conditions are not present at the site:

- Phase 1 & II Environmental Site Assessment Work
- Hazardous Materials (the project site has not been used to store or transmit hazardous materials)
- Ground-Water Quality (the property is served by the City of Morro Bay)
- On-Site Septic Systems (wastewater collected by the City of Morro Bay)
- Non-Tectonic Faulting and Hydrocollapse of Alluvial Fan Soils (alluvial fan soils not present)
- Regional Subsidence (the geologic units underlying the site are dense and not likely to subside)
- Volcanic Eruption (no active volcanoes are in San Luis Obispo County)
- Tsunami or Seiche (the site is above the tsunami flooding level)
- Radon-222 Gas (geologic materials with documented radon not present at site)
- Paleontologic Resources (none present at the site)

**Naturally Occurring Asbestos**

The serpentinite and ultramafic rock types contain asbestiform minerals. During construction, disturbed soils and rock can be expected to create dust that should be suppressed during construction activities. A dust control plan should be considered for this project. Permitting from the Air Pollution Control Board

or additional geologic investigations may be required to establish an exemption to this permitting requirement.

### **GRADING PLAN REVIEW AND FOUNDATION-PLAN REVIEW**

A certified engineering geologist should review the grading plan and foundation plan, when developed to determine if the plans conform to the recommendations provided herein. A certified engineering geologist should be present to witness the excavations for cut slopes, footings and retaining walls to determine whether the rock exposed is consistent with the rock types mapped and drilled during this investigation and the geotechnical exploration or it is different and requires additional evaluation. Sub-drainage plans should be reviewed to determine conformance with the recommendations presented in this engineering geologic report.

**GEOTECHNICAL INVESTIGATION  
SEA SHELL STAFF HOUSING  
1405 TERESA DRIVE  
MORRO BAY, CALIFORNIA**

**PROJECT 7-4309**

**1.0 INTRODUCTION**

This report presents the results of our geotechnical investigation for the proposed residences to be located at 1405 Teresa Drive in Morro Bay, California. A site location map is presented in Figure 1.

The property is bounded by Teresa Drive to the south, residential lots to the west and open space to the north and east. The proposed residences will be located to the north of the existing structure. In general, the terrain in this area slopes to the south with an average elevation of approximately 100 feet above mean sea level. Units 11 through 14 on the west side of the site are located adjacent to an existing twenty-five (25) foot high, approximately 1:1 (horizontal:vertical) cut slope. Units 1 through 10 on the east side of the site and are located on sloping terrain with gradients of approximately 2:1 to 4:1 (horizontal:vertical). At the time of our field exploration the building areas were covered with grasses, weeds and some trees.

It is our understanding that eight (8) residential structures composing 16 units will be constructed at the site. These buildings will be one and two story wood-framed structures with concrete slab-on-grade floors. Due to the sloping terrain some structures will incorporate concrete retaining walls. Footing loads for the structures are presently unavailable. For the purpose of this report, maximum loads on the order of 15 kips (columns) and 1.5 kip per lineal foot (continuous) have been estimated.

The project description is based on a site reconnaissance performed by a GSI Soils Inc., engineer and information provided by Pults and Associates and Cathy Novak Consulting. The plan provided forms the basis for the "Site Plan", Figure 2.

In the event that there is change in the nature, design or location of improvements, or if the assumed loads are not consistent with actual design loads, the conclusions and recommendations contained in this report should be reviewed and modified, if required.

Evaluations of the soils for hydrocarbons or other chemical properties are beyond the scope of the investigation.

## **2.0 PURPOSE AND SCOPE**

The purpose of this study was to explore and evaluate the surface and subsurface soil conditions at the site and to develop geotechnical information and design criteria for the proposed construction. The scope of this study included the following items.

1. A review of available soils information for this area of Morro Bay.
2. A field study consisting of a site reconnaissance and an exploratory boring program to formulate a description of the subsurface conditions.
3. A laboratory testing program performed on representative soil samples collected during our field study.
4. Engineering analysis of the data gathered during our field study, laboratory testing, and literature review. Development of recommendations for site preparation and grading, and geotechnical design criteria for foundations, retaining walls, and underground facilities.
5. Preparation of this report summarizing our findings, conclusions, and recommendations regarding the geotechnical aspects of the project site.

## **3.0 SUBSURFACE SOIL CONDITIONS**

The near surface soils encountered in our exploratory borings generally consisted of sandy clays to a depth of 1 to 5 feet. These clays were encountered in a moist state and in a soft condition in the upper one to two feet and becoming stiff to very stiff below this depth. Severely weathered clayey sandstone materials were encountered below the surface clay soils to a depth of 12 feet. These materials were found in a moist state and in a dense to very dense condition. Laboratory testing indicates that the surface sandy clays are highly expansive while the underlying bedrock has very low expansivity.

No free ground water was during our field exploration. However, very moist to saturated conditions can occur during wet winter months in the near surface soils. A more detailed description of the soils encountered is presented graphically on the "Exploratory Boring Logs", B-1 through B-6, Appendix A. An explanation of the symbols and descriptions used on these logs are presented on the "Soil Classification Chart".

The soil profile described above is generalized; therefore, the reader is advised to consult the boring logs (Appendix A) for soil conditions at specific locations. Care should be exercised in interpolating or extrapolating subsurface conditions between or beyond borings. On the boring logs we have indicated the soil type, moisture content, grain size, dry density, and the applicable United Soil Classification System Symbol.

The locations of our exploratory borings, shown on Site Plan, Figure 2, were approximately determined from features at the site. Hence, accuracy can be implied only to the degree that this method warrants. Surface elevations at boring locations were not determined.

#### 4.0 UBC SEISMIC COEFFICIENTS

A summary of the seismic factors applicable to this site is provided in Figure 5. The soil profile type would be considered an  $S_c$ , the seismic source is a Type B, and the near source factors  $N_a$  and  $N_v$  are 1.0 and 1.12 respectively. The seismic coefficients  $C_a$  and  $C_v$  would be  $0.40 N_a$  and  $0.56 N_v$  respectively.

#### 5.0 CONCLUSIONS AND RECOMMENDATIONS

1. The site is suitable for the proposed development provided the recommendations presented in this report are incorporated into the project plans and specifications.
2. All grading and foundation plans should be reviewed by GSI Soils Inc., hereinafter described as the Geotechnical Engineer, prior to contract bidding. This review should be performed to determine whether the recommendations contained within this report are incorporated into the project plans and specifications.

3. The Geotechnical Engineer should be notified at least two (2) working days before site clearing or grading operations commence, and should be present to observe the stripping of deleterious material and provide consultation to the Grading Contractor in the field.
4. Field observation and testing during the grading operations should be provided by the Geotechnical Engineer so that a decision can be formed regarding the adequacy of the site preparation, the acceptability of fill materials, and the extent to which the earthwork construction and the degree of compaction comply with the project geotechnical specifications. Any work related to grading performed without the full knowledge of, and under direct observation of the Geotechnical Engineer, may render the recommendations of this report invalid.

#### 5.1 Clearing and Stripping

1. All surface and subsurface deleterious materials should be removed from the proposed addition area and disposed of off-site. This includes, but is not limited to any buried utility lines, loose fills, septic systems, debris, building materials, and any other surface and subsurface structures within proposed building areas. Voids left from site clearing, should be cleaned and backfilled as recommended for structural fill.
2. Once the site has been cleared, the exposed ground surface should be stripped to remove surface vegetation and organic soil. The surface may be disced, rather than stripped, if the organic content of the soil is not more than three percent by weight. If stripping is required, depths should be determined by a member of our staff in the field at the time of stripping. Strippings may be either disposed of off-site or stockpiled for future use in landscape areas if approved by the landscape architect.

#### 5.2 Preparation of Building Pads

1. It is recommended that all footings extend a minimum of 12 inches into the weathered bedrock materials with slab-on-grade areas supported on 36 inches of suitable native or imported non-expansive materials. However, where suitable

bedrock materials (non-expansive) are exposed at pad grade further removals would not be required.

2. For slab-on-grade areas and where fill is to be placed, the native soils should be overexcavated to a depth of 36 inches below existing grades or finished pad grade, whichever is greater. The exposed surface should then be scarified to a depth of 12 inches, wetted to above optimum moisture, and compacted to at least ninety (90) percent of maximum dry density. The removed material can then be replaced and compacted (90%). However, the slab-on-grade areas should be capped with 36 inches of native non-expansive soils or a select material such as decomposed granite or equivalent. These soils should be similarly compacted to ninety (90) percent. The lateral limits of overexcavation and scarification should be at least 5 feet beyond the perimeter building and footing lines.
3. Where building pads are located entirely into suitable non-expansive or very low expansive bedrock materials further excavation may not be required. The exposed surface should be evaluated and approved by the geotechnical engineer. At a minimum the surface should be scarified to a depth of 12 inches and compacted to 90 percent.
4. In order to help minimize potential settlement problems associated with structures supported on a non-uniform thickness of compacted fill, the soils engineer should be consulted for specific site recommendations during grading.
5. Cut and fill slopes in native materials should not exceed 3:1 (horizontal: vertical) and should be properly compacted to 90 percent. The slopes should also be properly protected against erosion. Fill slopes should be overfilled and trimmed back to competent material. If steeper slopes are planned they should be evaluated in the field during grading. Our observations indicate the existing cut slope at the site is stable. The project geologist should evaluate this slope and any further bedrock cuts for overall and surficial stability.

6. The above grading is based on the strength characteristics of the materials under conditions of normal moisture that would result from rain water and do not take into consideration the additional activating forces applied by seepage from springs or subsurface water. Areas of observed seepage should be provided with subsurface drains to release the hydrostatic pressures.
7. All final grades should be provided with a positive drainage gradient away from foundations. Final grades should provide for rapid removal of surface water runoff. Ponding of water should not be allowed on building pads or adjacent to foundations.

### **5.3 Preparation of Paved Areas**

1. The upper 12 inches in driveway and paved areas should be replaced with crushed gravel or Class II Base. Pavement and driveway subgrades should be scarified to a depth of 12 inches below existing grade or finished subgrade prior to placing gravel or base. The soil should then be wetted to slightly above optimum moisture content and compacted to a minimum of 90 percent of maximum dry density.
2. The upper 6 inches of subgrade beneath all paved areas should be compacted to at least 95 percent relative compaction. Subgrade soils should not be allowed to dry out or have excessive construction traffic between the time of water conditioning and compaction, and the time of placement of the pavement structural section.

### **5.4 Structural Fill**

1. On-site processed sandstone (clayey sand materials) free of organic and deleterious material are suitable for use in structural areas. Structural fill should not contain rocks larger than 4 inches in greatest dimension, and should have no more than 15 percent larger than 2.5 inches in greatest dimension.
2. Import (decomposed granite or equivalent) should be free of organic and other deleterious material and should have a very low expansion potential with a

plasticity index of 10 or less. Before delivery to the site, a sample of the proposed import should be tested in our laboratory to determine its suitability for use as structural fill.

3. Structural fill using on-site inorganic soil or approved import should be placed in layers, each not exceeding eight inches in thickness before compaction. On-site inorganic or imported soil should be conditioned with water, or allowed to dry, to produce a soil water content at approximately optimum value, and should be compacted to at least 90 percent relative compaction based on ASTM D1557-91.

#### **5.5 Foundations**

1. Conventional continuous footings and spread footings may be used for support of the proposed structures. Spread footings should be connected to the perimeter footings with grade beams.
2. Due to the existing cut slope and the relatively steep terrain a minimum setback distance of 10 feet should be maintained between the outer edge of footings and the competent face of adjacent slopes.
3. Perimeter footings should be at least 15 inches wide with a minimum embedment of 12 inches into bedrock with a minimum overall depth of 30 inches below lowest adjacent grade. The footing bottoms should be observed and approved by the geotechnical engineer prior to placing steel and concrete. Where footing depths exceed 30 inches slurry (3 sack cement/sand) could be used between the bottom of the excavations and the underside of the footings. Spread footings should be a minimum of 2 feet square, similarly embedded a minimum of 12 inches into bedrock and tied to the perimeter footings with grade beams spaced at a maximum of 20 feet on center. The reinforcement for the footings and grade beams should be designed by the structural engineer, however, a minimum of two (2) No. 5 rebar should be provided top and bottom for continuous footings with dowels (#3 @ 18" on-center) to tie the perimeter footings and grade beams to slab areas.

3. An allowable dead plus live load bearing pressure of 3000 psf may be used for design. Total settlements of less than 1-inch are anticipated with differential settlements being 50 percent of this value.
4. The above allowable pressures are for support of dead plus live loads and may be increased by one-third for short-term wind and seismic loads.
5. Lateral forces on structures may be resisted by passive pressure acting against the sides of shallow footings and/or friction between the soil and the bottom of the footing. For resistance to lateral loads, a friction factor of 0.35 may be utilized for sliding resistance at the base of the spread footings in undisturbed native materials or engineered fill. A passive resistance of 350 pcf equivalent fluid weight may be used against the side of shallow footings.

#### 5.6 Slab-On-Grade Construction

1. Concrete slabs-on-grade and flatwork should not be placed directly on unprepared loose fill materials. Preparation of subgrade to receive concrete slabs-on-grade and flatwork should be processed as discussed in the preceding sections of this report.
2. Where concrete slabs-on-grade are to be constructed, the slabs should be underlain by a minimum of 6 inches of clean free-draining material such as clean gravel or permeable aggregate complying with Caltrans Standard Specifications 68, Class I, Type A or Type B; to service as a cushion and a capillary break. Clean gravel should have less than 3% passing the No. 200 sieve. A 15-mil Polyethylene-type membrane should be placed between the capillary break and the slab to provide an effective vapor barrier, and to minimize moisture condensation under the floor covering. All seams through the vapor barrier should be overlapped and sealed. Where pipes extend through the vapor barrier, the barrier should be sealed to the pipes. Tears or punctures in the moisture barrier should be completely repaired. It is suggested that a 2-inch thick sand layer be placed on top of the membrane to assist in the curing of the concrete. The sand should be lightly moistened prior to placing concrete.

3. Concrete slabs-on-grade should be a minimum of 4 inches thick and should be reinforced with No. 3 reinforcing bars placed at 18 inches on-center both ways at or slightly above the center of the structural section. Reinforcing bars should have a minimum clear cover of 1.5 inches, and hot bars should be cooled prior to placing concrete. The aforementioned reinforcement may be used for anticipated uniform floor loads not exceeding 100 psf. If floor loads greater than 100 psf are anticipated the slab should be evaluated by a structural engineer.
4. All slabs should be poured at a maximum slump of less than 5 inches. Excessive water content is the major cause of concrete cracking. For design of concrete floors, a modulus of subgrade reaction of  $k = 100$  psi per inch would be applicable to on-site engineered fill soils.

**5.7 Site Retaining Walls**

1. Retaining walls should be designed to resist lateral pressures from adjacent soils and surcharge loads applied behind the walls.

| Lateral Pressure and Condition<br>(Compacted Fill) |                         | Equivalent Fluid Pressure, pcf |                        |
|----------------------------------------------------|-------------------------|--------------------------------|------------------------|
|                                                    |                         | Unrestrained Wall              | Rigidly Supported Wall |
| Active Case,<br>Drained                            | Level-native soils      | 60                             | --                     |
|                                                    | Level-granular backfill | 30                             | --                     |
| At-Rest Case,<br>Drained                           | Level-native soils      | --                             | 80                     |
|                                                    | Level-sand backfill     |                                | 50                     |
| Passive Case,<br>Drained                           | Level                   | 300                            | --                     |
|                                                    | 2:1 Sloping Down        | 150                            | --                     |

For sloping backfill add 1 pcf for every 2 deg. (Active case) and 1.5 pcf for every 2 deg. (At-rest case)

2. Isolated retaining wall foundations should extend a minimum of 12 inches into bedrock with a minimum overall depth of 30 inches below lowest adjacent grade. An allowable toe pressure of 3,000 psf is recommended in competent bedrock approved by the geotechnical engineer. A coefficient of friction of 0.35 may be used between subgrade materials and concrete footings.

3. In addition to the lateral soil pressure given above, retaining walls should be designed to support any design live load, such as from vehicle and construction surcharges, etc., to be supported by the wall backfill. If construction vehicles are required to operate within 10 feet of a wall, supplemental pressures will be induced and should be taken into account through design.
4. The above-recommended pressures are based on the assumption that sufficient subsurface drainage will be provided behind the walls to prevent the build-up of hydrostatic pressure. To achieve this we recommend that a filter material be placed behind all proposed walls. The blanket of filter material should be a minimum of 12 inches thick and should extend from the bottom of the wall to within 12 inches of the ground surface. The top 12 inches should consist of water conditioned, compacted native soil. A 4-inch diameter drain pipe should be installed near the bottom of the filter blanket with perforations facing down. The drain pipe should be underlain by at least 4 inches of filter type material. Adequate gradients should be provided to discharge water that collects behind the retaining wall to an adequately controlled discharge system with suitably projected outlets. The filter material should conform to Class I, Type B permeable material as specified in Section 68 of the California Department of Transportation Standard Specifications, current edition. A typical 1" x #4 concrete coarse aggregate mix approximates this specification.
5. For hydrostatic loading conditions (i.e. no free drainage behind walls), an additional loading of 45 pcf equivalent fluid weight should be added to the above soil pressures. If it is necessary to design retaining structures for submerged conditions, allowed bearing and passive pressures should be reduced by 50 percent. In addition, soil friction beneath the base of the foundations should be neglected.
6. Precautions should be taken to ensure that heavy compaction equipment is not used immediately adjacent to walls, so as to prevent undue pressure against, and movement of, the walls.

7. The use of rubber water-stops between the footing and wall and an impermeable barrier such as Paraseal (or equivalent) should be considered for any basement construction, and for building walls which retain earth.

**5.8 Pavement Design**

1. The following table provides recommended pavement sections based on an estimated R-Value of 8 for the near surface sandy clay soils encountered at the site.

| RECOMMENDED MINIMUM ASPHALT CONCRETE PAVEMENT SECTIONS DESIGN THICKNESS                                                                                                                                                           |          |          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|----------|
| T.I.                                                                                                                                                                                                                              | A.C.-in. | A.B.-in. |
| 4.5                                                                                                                                                                                                                               | 2.5      | 9.0      |
| 5.0                                                                                                                                                                                                                               | 2.5      | 10.5     |
| 5.5                                                                                                                                                                                                                               | 3.0      | 11.0     |
| 6.0                                                                                                                                                                                                                               | 3.0      | 14.0     |
| 6.5                                                                                                                                                                                                                               | 3.5      | 14.5     |
| 7.0                                                                                                                                                                                                                               | 3.5      | 16.0     |
| 8.0                                                                                                                                                                                                                               | 4.5      | 17.5     |
| 8.5                                                                                                                                                                                                                               | 5.0      | 18.5     |
| 9.0                                                                                                                                                                                                                               | 5.5      | 19.0     |
| T.I. = Traffic Index<br>A.C. = Asphaltic Concrete - must meet specifications for Caltrans Type B Asphalt Concrete<br>A.B. = Aggregate Base - must meet specifications for Caltrans Class II Aggregate Base (R-Value = minimum 78) |          |          |

2. All asphalt pavement construction and materials used should conform with Sections 26 and 39 of the latest edition of the Standard Specifications, State of California, Department of Transportation. Aggregate bases and sub-bases should also be compacted to a minimum relative compaction of 95 percent based on ASTM D1557-91.

3. R-value samples should be obtained and tested at the completion of rough grading and the pavement sections confirmed or revised. All asphaltic concrete pavement sections and all sections should be crowned for good drainage.

**5.9 Underground Facilities Construction**

1. The attention of contractors, particularly the underground contractors, should be drawn to the State of California Construction Safety Orders for "Excavations, Trenches, Earthwork". Trenches or excavations greater than 5 feet in depth should be shored or sloped back in accordance with OSHA Regulations prior to entry.
2. For purposes of this section of the report, bedding is defined as material placed in a trench up to 1 foot above a utility pipe and backfill is all material placed in the trench above the bedding. Unless concrete bedding is required around utility pipes, free-draining sand should be used as bedding. Sand proposed for use as bedding should be tested in our laboratory to verify its suitability and to measure its compaction characteristics. Sand bedding should be compacted by mechanical means to achieve at least 90 percent relative compaction based on ASTM Test D1557-91.
3. On-site inorganic soil, or approved import, may be used as utility trench backfill. Proper compaction of trench backfill will be necessary under and adjacent to structural fill, building foundations, concrete slabs and vehicle pavements. In these areas, backfill should be conditioned with water (or allowed to dry), to produce a soil water content of about 2 to 3 percent above the optimum value and placed in horizontal layers each not exceeding 8 inches in thickness before compaction. Each layer should be compacted to at least 90 percent relative compaction based on ASTM Test D1557-91. The top lift of trench backfill under vehicle pavements should be compacted to the requirements given in report section 5.3 for vehicle pavement subgrades. Trench walls must be kept moist prior to and during backfill placement.

**5.10 Surface and Subsurface Drainage**

1. Concentrated surface water runoff within or immediately adjacent to the site should be conveyed in pipes or in lined channels to discharge areas that are relatively level or that are adequately protected against erosion.
2. Water from roof downspouts should be conveyed in pipes that discharge in areas a safe distance away from structures. Surface drainage gradients should be planned to prevent ponding and promote drainage of surface water away from building foundations, edges of pavements and sidewalks. For soil areas we recommend that a minimum of two (2) percent gradient be maintained with an increase to four (4) percent for the first five (5) feet adjacent to the footings.
3. Careful attention should be paid to erosion protection of soil surfaces adjacent to the edges of roads, curbs and sidewalks, and in other areas where "hard" edges of structures may cause concentrated flow of surface water runoff. Erosion resistant matting such as Miramat, or other similar products, may be considered for lining drainage channels.

**5.11 Temporary Excavations and Slopes**

1. Conventional earth moving equipment should be adequate to excavate the soils at the site.
2. We recommend that temporary trench walls exceeding five (5) feet in depth be sloped at an inclination of 1:1 (horizontal:vertical). However, during the rainy season, or where soft or loose sediments, or perched water conditions are found, flatter slopes (1½:1 to 2:1) may be required.
3. It should be noted that it is the *Contractor's* responsibility to maintain safe cut slopes based on actual field conditions and according to OSHA requirements. Temporary Slopes at gradients of 1:1 should not be open for more than 2 to 3 days. In some geologic units, perched water may be present locally in the slope face. The stability of the slopes may be compromised somewhat where these conditions exist due to softening or piping of the saturated materials.

4. Where the excavation bottom is locally wet, soft and yielding, it is recommended that the bottom be stabilized prior to placement of fill. Methods such as the use of pit-run gravels and cobbles on the excavated bottom covered with a geotextile fabric such as Mirafi 600x or placement of a Class II base material over a similar fabric could be used. The *Contractor* should be responsible for design and implementation of stabilization techniques.
5. Where the temporary trench slopes are inclined as described above, no shoring is required. However, where adjacent features may influence establishment of appropriate slopes, the *Contractor* may elect to use shoring. In no case should personnel enter trenches with vertical sidewalls greater than 5 feet deep without proper shoring. Design and installation of the shoring should be the responsibility of the *Contractor* and should be performed according to OSHA requirements.
6. Shoring should be designed to resist the lateral earth pressures provided, assuming no hydrostatic loads. If ground water is encountered the shoring should be designed for the required hydrostatic pressures.

#### 5.12 Site Slope Stability

1. As indicated previously the existing and proposed site slopes should be evaluated by the project geologist.
2. On the west side of the site, steeper slopes (approximately 1:1) were cut for the construction of the existing structure. An existing retaining wall approximately 5 feet high is located at the toe of this slope. Severely weathered bedrock materials are exposed across the entire slope. Visual observation did not reveal any obvious sign of instability.
3. The following minimum drainage and slope recommendations are also provided.
  - a. Where possible compacted materials utilized in the construction of the fill slopes should comprise at least 20 percent fine grained (passing #200

sieve) soils in a zone equal to 2 the slope height.

- b. Future cut slopes should be observed by the project geologist and a representative of the geotechnical engineer during grading and evaluated for stability.
- c. Hydroseeding or planting a surface cover of protective vegetation on all slope surfaces. In addition, an erosion control blanket (Greenfix CF072RR or equivalent) should be placed over the slopes to protect the vegetation while it becomes established.
- d. Water should not be allowed to run freely over the sides of the slopes. A lined V-ditch should be constructed above all cut and fill slopes.

#### 6.0 LIMITATIONS AND UNIFORMITY OF CONDITIONS

- 1. It should be noted that it is the responsibility of the owner or his/her representative to notify **GSI Soils Inc.** a minimum of 48 hours before any stripping, grading, or foundation excavations can commence at this site.
- 2. The recommendations of this report are based upon the assumption that the soil conditions do not deviate from those disclosed during our study. Should any variations or undesirable conditions be encountered during grading of the site, **GSI Soils Inc.** will provide supplemental recommendations as dictated by the field conditions.
- 3. This report is issued with the understanding that it is the responsibility of the owner or his/her representative to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project, and incorporated into the project plans and specifications. The owner or his/her representative is responsible for ensuring that the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

4. As of the present date, the findings of this report are valid for the property studied. With the passage of time, changes in the conditions of a property can occur whether they be due to natural processes or to the works of man on this or adjacent properties. Legislation or the broadening of knowledge may result in changes in applicable standards. Changes outside of our control may find this report to be invalid, wholly or partially. Therefore, this report should not be relied upon after a period of three (3) years without our review nor is it applicable for any properties other than those studied.
  
5. Validity of the recommendations contained in this report is also dependent upon the prescribed testing and observation program during the site preparation and construction phases. Our firm assumes no responsibility for construction compliance with these design concepts and recommendations unless we have been retained to perform continuous on-site testing and review during all phases of site preparation, grading, and foundation/slab construction.

Thank you for the opportunity to have been of service in preparing this report. If you have any questions or require additional assistance, please feel free to contact the undersigned at (805) 543-5493.

Sincerely,

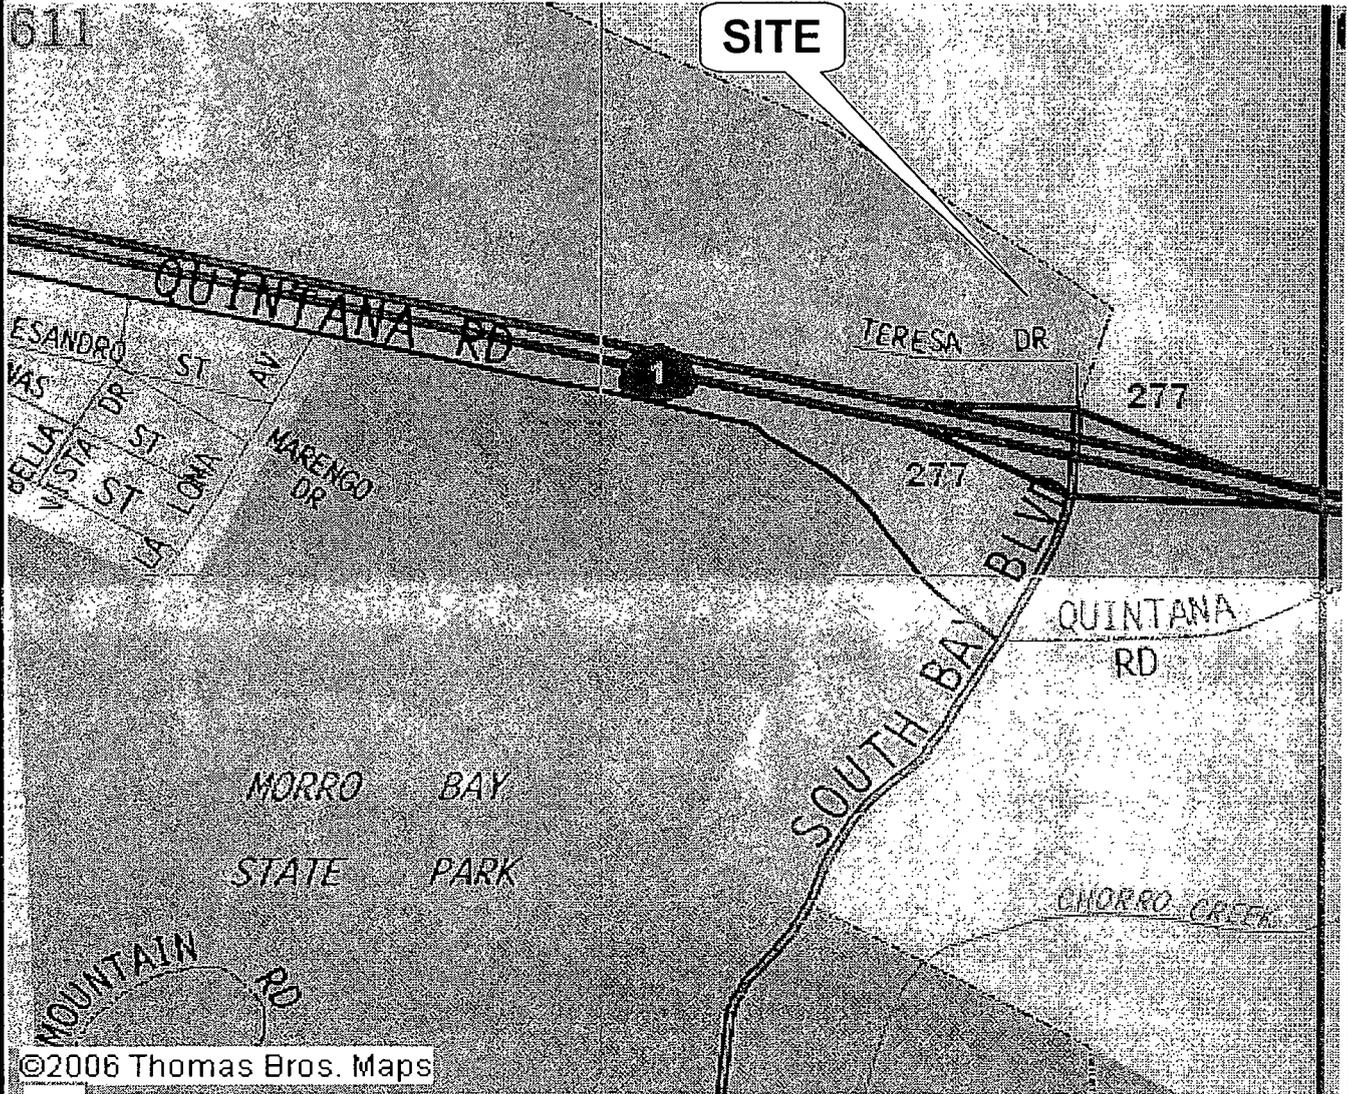

**GSI SOILS INC.**

**NOTES**

Positive surface drainage shall be established away from the foundation system of the proposed structure at a 2% slope (min) for a minimum distance of 5' away from the structure and should be maintained throughout the life of the structure.

Drainage and surface water management should include the use of gutters and downspouts on the roof of the structure. Downspouts should be captured in a sealed pipe and diverted at least 10 horizontal feet away from the adjacent foundation system.

All drainage should be collected and directed away from the structures and away from slopes as shown in the figures. Drainage should be directed to proper non-erosive outfall facilities

(optional) Subterranean drains placed adjacent to the footings should be set at an elevation lower than the interior crawl space grade or the pad subgrade but not deeper than the bottom of the footing (see figure). Drain Pipes should be rigid perforated PVC with perforations down (5 to 7 o'clock). The pipes should be set 4" to 6" above the base of the trench and be completely surrounded by 1" gravel. The gravel should be wrapped with filter fabric (Mirafi 140n or equiv.). These drains should not be connected to surface sources such as yard drains or roof downspouts.

Boring Logs

February 16, 2007

Project 7-4309

## FIELD INVESTIGATION

### Test Hole Drilling

The field investigation was conducted on January 24, 2007. Six (6) exploratory borings were drilled at the approximate locations indicated on the Site Plan, Figure 2. The locations of these borings were approximated in the field.

Undisturbed and bulk samples were obtained at various depths during test hole drilling. The undisturbed samples were obtained by driving a 2.4-inch inside diameter sampler into soils. Bulk samples were also obtained during drilling.

### Logs of Boring

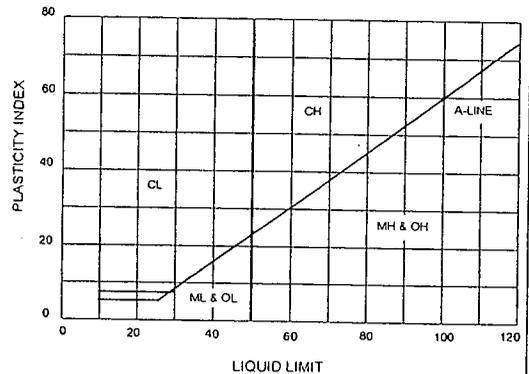

A continuous log of soils, as encountered in the borings was recorded at the time of the field investigation, by a Staff Engineer. The Exploration Boring Logs are attached.

Locations and depth of sampling, in-situ soil dry densities and moisture contents are tabulated in the Boring Logs.

## **APPENDIX B**

Laboratory Testing  
Moisture-Density Tests  
Direct Shear Test  
R Value Test  
Expansion Index  
Atterberg Limits

## LABORATORY TESTING

### Moisture-Density Tests

The field moisture content, as a percentage of the dry weight of the soil, was determined by weighing samples before and after oven drying. Dry densities, in pounds per cubic foot, were also determined for the undisturbed samples. Results of these determinations are shown in the Exploration Boring Logs.

### Direct Shear Test

Direct shear tests were performed on undisturbed samples, to determine strength characteristics of the soil. The test specimens were soaked prior to testing. Results of the shear strength tests are attached.

### Resistance (R) Value Test

An R-Value test was estimated based on sieve analysis and plasticity on a bulk sample obtained from boring B-1. The results of the tests indicates that the clay soils have an R-Value of 8.

### Expansion Index Tests

Expansion indices (EI) of 98 to 120 were obtained for the near surface sandy clay soils. The clayey sandstones had EI's of 6 to 14. The test procedures were performed in accordance with Uniform Building Code Standard 29-2.

### Atterberg Limits

The liquid limit, plastic limit and plasticity index was determined for selected samples in accordance with ASTM D4318. The results are presented on the boring logs.

**UPDATED GEOTECHNICAL INVESTIGATION  
SEA SHELL STAFF HOUSING  
1405 TERESA DRIVE  
MORRO BAY, CALIFORNIA**

**PROJECT 7-4309**

**1.0 INTRODUCTION**

This report presents the results of our updated geotechnical investigation for the proposed residences to be located at 1405 Teresa Drive in Morro Bay, California. Previously eight (8) structures were planned with five (5) of these being located above the cut slope on the north side of the property. The new site plan provided indicates that the five (5) structures adjacent to the cut slope will be eliminated with six (6) new housing structures being constructed north and east of the existing building. A site location map is presented in Figure 1 with a revised site plan in Figure 2. Previously a geotechnical investigation was performed for this site on February 16, 2007. This report includes recently adopted seismic considerations of the 2007 California Building Code (CBC).

The property is bounded by Teresa Drive to the south, residential lots to the west and open space to the north and east. In general, the terrain in this area slopes to the south with an average elevation of approximately 100 feet above mean sea level. The proposed structures will be located on a steeply sloping area of the site with gradients of approximately 2:1 to 4:1 (horizontal:vertical). At the time of our field exploration the building areas were covered with grasses, weeds and some trees.

As indicated above six (6) residential structures will be constructed at the site. These buildings will be one and two story wood-framed structures with concrete slab-on-grade floors. Due to the sloping terrain some structures will incorporate concrete retaining walls. Footing loads for the structures are presently unavailable. For the purpose of this report, maximum loads on the order of 15 kips (columns) and 1.5 kip per lineal foot (continuous) have been estimated.

The project description is based on a site reconnaissance performed by a GSI Soils Inc., engineer and information provided by Pults and Associates and Cathy Novak Consulting. The plan provided forms the basis for the "Site Plan", Figure 2.

In the event that there is change in the nature, design or location of improvements, or if the assumed loads are not consistent with actual design loads, the conclusions and recommendations contained in this report should be reviewed and modified, if required. Evaluations of the soils for hydrocarbons or other chemical properties are beyond the scope of the investigation.

## **2.0 PURPOSE AND SCOPE**

The purpose of this study was to review the surface and subsurface soil conditions at the site and to provide updated geotechnical information and design criteria for the proposed project. The scope of this work and our original study included the following items.

1. A review of available soils information for this area of Morro Bay.
2. A field study consisting of a site reconnaissance and an exploratory boring program to formulate a description of the subsurface conditions.
3. A laboratory testing program performed on representative soil samples collected during our field study.
4. Engineering analysis of the data gathered during our field study, laboratory testing, and literature review. Development of recommendations for site preparation and grading, and geotechnical design criteria for foundations, retaining walls, and underground facilities.
5. Preparation of this report summarizing our findings, conclusions, and recommendations regarding the geotechnical aspects of the project site.

## **3.0 SUBSURFACE SOIL CONDITIONS**

The near surface soils encountered in our exploratory borings generally consisted of sandy clays to a depth of 1 to 5 feet. These clays were encountered in a moist state and in a soft condition in the upper one to two feet and becoming stiff to very stiff below this depth. Severely weathered clayey sandstone materials were encountered below the surface clay soils to a depth of 12 feet. These materials were found in a moist state and in a dense to very dense condition.

Laboratory testing indicates that the surface sandy clays are highly expansive while the underlying bedrock has very low expansivity.

No free ground water was during our field exploration. However, very moist to saturated conditions can occur during wet winter months in the near surface soils. A more detailed description of the soils encountered is presented graphically on the "Exploratory Boring Logs", B-1 through B-4, Appendix A. An explanation of the symbols and descriptions used on these logs are presented on the "Soil Classification Chart".

The soil profile described above is generalized; therefore, the reader is advised to consult the boring logs (Appendix A) for soil conditions at specific locations. Care should be exercised in interpolating or extrapolating subsurface conditions between or beyond borings. On the boring logs we have indicated the soil type, moisture content, grain size, dry density, and the applicable United Soil Classification System Symbol.

The locations of our exploratory borings, shown on Site Plan, Figure 2, were approximately determined from features at the site. Hence, accuracy can be implied only to the degree that this method warrants. Surface elevations at boring locations were not determined.

#### 4.0 **SEISMIC CONSIDERATIONS**

##### 4.1 **CBC Seismic Coefficients**

In accordance with the 2007 CBC the project site was positioned on the 2002 USGS Seismic Hazard Maps for a 2% probability of exceedance in 50 years to determine the maximum considered earthquake spectral response accelerations in accordance with the 2007 CBC. The design acceleration coefficients for short periods ( $S_{DS}$ ) and at 1-second ( $S_{D1}$ ) were found to be 0.823g and 0.419g respectively. A site class C should be used of design of the structures.

##### 4.2 **Liquefaction Analysis**

Liquefaction is described as the sudden loss of soil shear strength due to a rapid increase of pore water pressures caused by cyclic loading from a seismic event. In simple terms it means that the soil acts more like a fluid than a solid in a liquefiable event. In order for liquefaction to occur, the following are generally

needed; granular soils (sand, silty sand and sandy silt), groundwater and low density (very loose to medium dense) conditions. A detailed liquefaction study was not part of our scope for this project, however an opinion can be provided based on the borings performed at the site. The results of our borings indicate that severely weathered bedrock materials exist below a depth of 3 to 5 feet. Based on this information the potential for liquefaction at the site would be negligible. However, this is a preliminary assessment and a detailed liquefaction study would be required to fully investigate the potential for liquefaction.

**5.0 CONCLUSIONS AND RECOMMENDATIONS**

1. The site is suitable for the proposed staff housing provided the recommendations presented in this report are incorporated into the project plans and specifications.
2. All grading and foundation plans should be reviewed by GSI Soils Inc., hereinafter described as the Geotechnical Engineer, prior to contract bidding. This review should be performed to determine whether the recommendations contained within this report are incorporated into the project plans and specifications.
3. The Geotechnical Engineer should be notified at least two (2) working days before site clearing or grading operations commence, and should be present to observe the stripping of deleterious material and provide consultation to the Grading Contractor in the field.
4. Field observation and testing during the grading operations should be provided by the Geotechnical Engineer so that a decision can be formed regarding the adequacy of the site preparation, the acceptability of fill materials, and the extent to which the earthwork construction and the degree of compaction comply with the project geotechnical specifications. Any work related to grading performed without the full knowledge of, and under direct observation of the Geotechnical Engineer, may render the recommendations of this report invalid.

**5.1 Clearing and Stripping**

1. All surface and subsurface deleterious materials should be removed from the proposed addition area and disposed of off-site. This includes, but is not limited to any buried utility lines, loose fills, septic systems, debris, building materials, and any other surface and subsurface structures within proposed building areas. Voids left from site clearing, should be cleaned and backfilled as recommended for structural fill.
  
2. Once the site has been cleared, the exposed ground surface should be stripped to remove surface vegetation and organic soil. The surface may be disced, rather than stripped, if the organic content of the soil is not more than three percent by weight. If stripping is required, depths should be determined by a member of our staff in the field at the time of stripping. Strippings may be either disposed of off-site or stockpiled for future use in landscape areas if approved by the landscape architect.

**5.2 Preparation of Building Pads**

1. It is recommended that all footings extend a minimum of 12 inches into the weathered bedrock materials with slab-on-grade areas supported on 36 inches of suitable native or imported non-expansive materials. However, where suitable bedrock materials (non-expansive) are exposed at pad grade further removals would not be required.
  
2. For slab-on-grade areas and where fill is to be placed, the native soils should be overexcavated to a depth of 36 inches below existing grades or finished pad grade, whichever is greater. The exposed surface should then be scarified to a depth of 12 inches, wetted to above optimum moisture, and compacted to at least ninety (90) percent of maximum dry density. The removed material can then be replaced and compacted (90%). However, the slab-on-grade areas should be capped with 36 inches of native non-expansive soils or a select material such as decomposed granite or equivalent. These soils should be similarly compacted to ninety (90) percent. The lateral limits of overexcavation

and scarification should be at least 5 feet beyond the perimeter building and footing lines.

3. Where building pads are located entirely into suitable non-expansive or very low expansive bedrock materials further excavation may not be required. The exposed surface should be evaluated and approved by the geotechnical engineer. At a minimum the surface should be scarified to a depth of 12 inches and compacted to 90 percent.
4. In order to help minimize potential settlement problems associated with structures supported on a non-uniform thickness of compacted fill, the soils engineer should be consulted for specific site recommendations during grading.
5. Cut and fill slopes in native materials should not exceed 3:1 (horizontal: vertical) and should be properly compacted to 90 percent. The slopes should also be properly protected against erosion. Fill slopes should be overfilled and trimmed back to competent material. If steeper slopes are planned they should be evaluated in the field during grading. Our observations indicate the existing cut slope at the site is stable. The project geologist should evaluate this slope and any further bedrock cuts for overall and surficial stability.
6. The above grading is based on the strength characteristics of the materials under conditions of normal moisture that would result from rain water and do not take into consideration the additional activating forces applied by seepage from springs or subsurface water. Areas of observed seepage should be provided with subsurface drains to release the hydrostatic pressures.
7. All final grades should be provided with a positive drainage gradient away from foundations. Final grades should provide for rapid removal of surface water runoff. Ponding of water should not be allowed on building pads or adjacent to foundations.

**5.3 Preparation of Paved Areas**

1. The upper 12 inches in driveway and paved areas should be replaced with crushed gravel or Class II Base. Pavement and driveway subgrades should be scarified to a depth of 12 inches below existing grade or finished subgrade prior to placing gravel or base. The soil should then be wetted to slightly above optimum moisture content and compacted to a minimum of 90 percent of maximum dry density.
2. The upper 6 inches of subgrade beneath all paved areas should be compacted to at least 95 percent relative compaction. Subgrade soils should not be allowed to dry out or have excessive construction traffic between the time of water conditioning and compaction, and the time of placement of the pavement structural section.

**5.4 Structural Fill**

1. On-site processed sandstone (clayey sand materials) free of organic and deleterious material are suitable for use in structural areas. Structural fill should not contain rocks larger than 4 inches in greatest dimension, and should have no more than 15 percent larger than 2.5 inches in greatest dimension.
2. Import (decomposed granite or equivalent) should be free of organic and other deleterious material and should have a very low expansion potential with a plasticity index of 10 or less. Before delivery to the site, a sample of the proposed import should be tested in our laboratory to determine its suitability for use as structural fill.
3. Structural fill using on-site inorganic soil or approved import should be placed in layers, each not exceeding eight inches in thickness before compaction. On-site inorganic or imported soil should be conditioned with water, or allowed to dry, to produce a soil water content at approximately optimum value, and should be compacted to at least 90 percent relative compaction based on ASTM D1557-91.

**5.5 Foundations**

1. Conventional continuous footings and spread footings may be used for support of the proposed structures. Spread footings should be connected to the perimeter footings with grade beams.
2. Perimeter footings should be at least 15 inches wide with a minimum embedment of 12 inches into bedrock with a minimum overall depth of 30 inches below lowest adjacent grade. In addition, a minimum setback distance of 10 feet should be maintained between the outer edge of footings and the competent face of adjacent slopes. The footing bottoms should be observed and approved by the geotechnical engineer prior to placing steel and concrete. Where footing depths exceed 30 inches slurry (3 sack cement/sand) could be used between the bottom of the excavations and the underside of the footings. Spread footings should be a minimum of 2 feet square, similarly embedded a minimum of 12 inches into bedrock and tied to the perimeter footings with grade beams spaced at a maximum of 20 feet on center. The reinforcement for the footings and grade beams should be designed by the structural engineer, however, a minimum of two (2) No. 5 rebar should be provided top and bottom for continuous footings with dowels (#3 @ 18" on-center) to tie the perimeter footings and grade beams to slab areas.
3. An allowable dead plus live load bearing pressure of 3000 psf may be used for design. Total settlements of less than 1-inch are anticipated with differential settlements being 50 percent of this value.
4. The above allowable pressures are for support of dead plus live loads and may be increased by one-third for short-term wind and seismic loads.
5. Lateral forces on structures may be resisted by passive pressure acting against the sides of shallow footings and/or friction between the soil and the bottom of the footing. For resistance to lateral loads, a friction factor of 0.35 may be utilized for sliding resistance at the base of the spread footings in undisturbed

native materials or engineered fill. A passive resistance of 350 pcf equivalent fluid weight may be used against the side of shallow footings.

**5.6 Slab-On-Grade Construction**

1. Concrete slabs-on-grade and flatwork should not be placed directly on unprepared loose fill materials. Preparation of subgrade to receive concrete slabs-on-grade and flatwork should be processed as discussed in the preceding sections of this report.
  
2. Where concrete slabs-on-grade are to be constructed, the slabs should be underlain by a minimum of 6 inches of clean free-draining material such as clean gravel or permeable aggregate complying with Caltrans Standard Specifications 68, Class I, Type A or Type B, to service as a cushion and a capillary break. Clean gravel should have less than 3% passing the No. 200 sieve. A 15-mil Polyethylene-type membrane should be placed between the capillary break and the slab to provide an effective vapor barrier, and to minimize moisture condensation under the floor covering. All seams through the vapor barrier should be overlapped and sealed. Where pipes extend through the vapor barrier, the barrier should be sealed to the pipes. Tears or punctures in the moisture barrier should be completely repaired. It is suggested that a 2-inch thick sand layer be placed on top of the membrane to assist in the curing of the concrete. The sand should be lightly moistened prior to placing concrete.
  
3. Concrete slabs-on-grade should be a minimum of 4 inches thick and should be reinforced with No. 3 reinforcing bars placed at 18 inches on-center both ways at or slightly above the center of the structural section. Reinforcing bars should have a minimum clear cover of 1.5 inches, and hot bars should be cooled prior to placing concrete. The aforementioned reinforcement may be used for anticipated uniform floor loads not exceeding 100 psf. If floor loads greater than 100 psf are anticipated the slab should be evaluated by a structural engineer.
  
4. All slabs should be poured at a maximum slump of less than 5 inches. Excessive water content is the major cause of concrete cracking. For design of concrete

floors, a modulus of subgrade reaction of  $k = 100$  psi per inch would be applicable to on-site engineered fill soils.

**5.7 Site Retaining Walls**

- Retaining walls should be designed to resist lateral pressures from adjacent soils and surcharge loads applied behind the walls.

| Lateral Pressure and Condition<br>(Compacted Fill)                                                        |                           | Equivalent Fluid Pressure, pcf |                        |

|                                                                                                           |                           | Unrestrained Wall              | Rigidly Supported Wall |
| Active Case,<br>Drained                                                                                   | Level-native soils        | 60                             | --                     |
|                                                                                                           | Level-granular backfill   | 30                             | --                     |
| At-Rest Case,<br>Drained                                                                                  | Level-native soils        | --                             | 80                     |
|                                                                                                           | Level-sand backfill       |                                | 50                     |
| Passive Case,<br>Drained                                                                                  | Level<br>2:1 Sloping Down | 300                            | --                     |
|                                                                                                           |                           | 150                            |                        |
| For sloping backfill add 1 pcf for every 2 deg. (Active case) and 1.5 pcf for every 2 deg. (At-rest case) |                           |                                |                        |

- Isolated retaining wall foundations should extend a minimum of 12 inches into bedrock with a minimum overall depth of 30 inches below lowest adjacent grade. An allowable toe pressure of 3,000 psf is recommended in competent bedrock approved by the geotechnical engineer. A coefficient of friction of 0.35 may be used between subgrade materials and concrete footings.
- A seismic horizontal surcharge of  $10H^2$  (pounds per linear foot of wall) may be assumed to act on retaining walls. The surcharge will act at a height of  $0.6H$  above the wall base (where  $H$  is the height of the wall in feet). This surcharge force shall be added to an active design equivalent fluid pressure of 55 pounds per square foot of depth for the seismic condition.
- In addition to the lateral soil pressure given above, retaining walls should be designed to support any design live load, such as from vehicle and construction surcharges, etc., to be supported by the wall backfill. If construction vehicles are

required to operate within 10 feet of a wall, supplemental pressures will be induced and should be taken into account through design.

5. The above-recommended pressures are based on the assumption that sufficient subsurface drainage will be provided behind the walls to prevent the build-up of hydrostatic pressure. To achieve this we recommend that a filter material be placed behind all proposed walls. The blanket of filter material should be a minimum of 12 inches thick and should extend from the bottom of the wall to within 12 inches of the ground surface. The top 12 inches should consist of water conditioned, compacted native soil. A 4-inch diameter drain pipe should be installed near the bottom of the filter blanket with perforations facing down. The drain pipe should be underlain by at least 4 inches of filter type material. Adequate gradients should be provided to discharge water that collects behind the retaining wall to an adequately controlled discharge system with suitably projected outlets. The filter material should conform to Class I, Type B permeable material as specified in Section 68 of the California Department of Transportation Standard Specifications, current edition. A typical 1" x #4 concrete coarse aggregate mix approximates this specification.
6. For hydrostatic loading conditions (i.e. no free drainage behind walls), an additional loading of 45 pcf equivalent fluid weight should be added to the above soil pressures. If it is necessary to design retaining structures for submerged conditions, allowed bearing and passive pressures should be reduced by 50 percent. In addition, soil friction beneath the base of the foundations should be neglected.
7. Precautions should be taken to ensure that heavy compaction equipment is not used immediately adjacent to walls, so as to prevent undue pressure against, and movement of, the walls.
8. The use of rubber water-stops between the footing and wall and an impermeable barrier such as Paraseal (or equivalent) should be considered for any basement construction, and for building walls which retain earth.

**5.8 Pavement Design**

1. The following table provides recommended pavement sections based on an estimated R-Value of 8 for the near surface sandy clay soils encountered at the site.

| RECOMMENDED MINIMUM ASPHALT CONCRETE<br>PAVEMENT SECTIONS DESIGN THICKNESS                                                                                                                                                        |          |          |

| 9.0                                                                                                                                                                                                                               | 5.5      | 19.0     |
| T.I. = Traffic Index<br>A.C. = Asphaltic Concrete - must meet specifications for Caltrans Type B Asphalt Concrete<br>A.B. = Aggregate Base - must meet specifications for Caltrans Class II Aggregate Base (R-Value = minimum 78) |          |          |

2. All asphalt pavement construction and materials used should conform with Sections 26 and 39 of the latest edition of the Standard Specifications, State of California, Department of Transportation. Aggregate bases and sub-bases should also be compacted to a minimum relative compaction of 95 percent based on ASTM D1557-91.
3. R-value samples should be obtained and tested at the completion of rough grading and the pavement sections confirmed or revised. All asphaltic concrete pavement sections and all sections should be crowned for good drainage.

**5.9 Underground Facilities Construction**

1. The attention of contractors, particularly the underground contractors, should be drawn to the State of California Construction Safety Orders for "Excavations, Trenches, Earthwork". Trenches or excavations greater than 5 feet in depth should be shored or sloped back in accordance with OSHA Regulations prior to entry.
  
2. For purposes of this section of the report, bedding is defined as material placed in a trench up to 1 foot above a utility pipe and backfill is all material placed in the trench above the bedding. Unless concrete bedding is required around utility pipes, free-draining sand should be used as bedding. Sand proposed for use as bedding should be tested in our laboratory to verify its suitability and to measure its compaction characteristics. Sand bedding should be compacted by mechanical means to achieve at least 90 percent relative compaction based on ASTM Test D1557-91.
  
3. On-site inorganic soil, or approved import, may be used as utility trench backfill. Proper compaction of trench backfill will be necessary under and adjacent to structural fill, building foundations, concrete slabs and vehicle pavements. In these areas, backfill should be conditioned with water (or allowed to dry), to produce a soil water content of about 2 to 3 percent above the optimum value and placed in horizontal layers each not exceeding 8 inches in thickness before compaction. Each layer should be compacted to at least 90 percent relative compaction based on ASTM Test D1557-91. The top lift of trench backfill under vehicle pavements should be compacted to the requirements given in report section 5.3 for vehicle pavement subgrades. Trench walls must be kept moist prior to and during backfill placement.

**5.10 Surface and Subsurface Drainage**

1. Concentrated surface water runoff within or immediately adjacent to the site should be conveyed in pipes or in lined channels to discharge areas that are relatively level or that are adequately protected against erosion.

2. Water from roof downspouts should be conveyed in pipes that discharge in areas a safe distance away from structures. Surface drainage gradients should be planned to prevent ponding and promote drainage of surface water away from building foundations, edges of pavements and sidewalks. For soil areas we recommend that a minimum of five (5) percent gradient be maintained adjacent to the footings.
3. Careful attention should be paid to erosion protection of soil surfaces adjacent to the edges of roads, curbs and sidewalks, and in other areas where "hard" edges of structures may cause concentrated flow of surface water runoff. Erosion resistant matting such as Miramat, or other similar products, may be considered for lining drainage channels.

**5.11 Temporary Excavations and Slopes**

1. Conventional earth moving equipment should be adequate to excavate the soils at the site.
2. We recommend that temporary trench walls exceeding five (5) feet in depth be sloped at an inclination of 1:1 (horizontal:vertical). However, during the rainy season, or where soft or loose sediments, or perched water conditions are found, flatter slopes (1½:1 to 2:1) may be required.
3. It should be noted that it is the *Contractor's* responsibility to maintain safe cut slopes based on actual field conditions and according to OSHA requirements. Temporary Slopes at gradients of 1:1 should not be open for more than 2 to 3 days. In some geologic units, perched water may be present locally in the slope face. The stability of the slopes may be compromised somewhat where these conditions exist due to softening or piping of the saturated materials.
4. Where the excavation bottom is locally wet, soft and yielding, it is recommended that the bottom be stabilized prior to placement of fill. Methods such as the use of pit-run gravels and cobbles on the excavated bottom covered with a geotextile fabric such as Mirafi 600x or placement of a Class II base material over a similar

fabric could be used. The *Contractor* should be responsible for design and implementation of stabilization techniques.

5. Where the temporary trench slopes are inclined as described above, no shoring is required. However, where adjacent features may influence establishment of appropriate slopes, the *Contractor* may elect to use shoring. In no case should personnel enter trenches with vertical sidewalls greater than 5 feet deep without proper shoring. Design and installation of the shoring should be the responsibility of the *Contractor* and should be performed according to OSHA requirements.
6. Shoring should be designed to resist the lateral earth pressures provided, assuming no hydrostatic loads. If ground water is encountered the shoring should be designed for the required hydrostatic pressures.

**5.12 Slope Stability**

1. As indicated previously the existing and proposed site slopes should be evaluated by the project geologist.
2. On the west side of the site, steeper slopes (approximately 1:1) were cut for the construction of the existing structure. An existing retaining wall approximately 5 feet high is located at the toe of this slope. Severely weathered bedrock materials are exposed across the entire slope. Visual observation did not reveal any obvious sign of instability.
3. The following minimum drainage and slope recommendations are also provided.
  - a. Where possible compacted materials utilized in the construction of the fill slopes should comprise at least 20 percent fine grained (passing #200 sieve) soils in a zone equal to 2 the slope height.
  - b. Future cut slopes should be observed by the project geologist and a representative of the geotechnical engineer during grading and evaluated

for stability.

- c. Hydroseeding or planting a surface cover of protective vegetation on all slope surfaces. In addition, an erosion control blanket (Greenfix CF072RR or equivalent) should be placed over the slopes to protect the vegetation while it becomes established.
- d. Water should not be allowed to run freely over the sides of the slopes. A lined V-ditch should be constructed above all cut and fill slopes.

**6.0 LIMITATIONS AND UNIFORMITY OF CONDITIONS**

- 1. It should be noted that it is the responsibility of the owner or his/her representative to notify **GSI Soils Inc.** a minimum of 48 hours before any stripping, grading, or foundation excavations can commence at this site.
- 2. The recommendations of this report are based upon the assumption that the soil conditions do not deviate from those disclosed during our study. Should any variations or undesirable conditions be encountered during grading of the site, **GSI Soils Inc.** will provide supplemental recommendations as dictated by the field conditions.
- 3. This report is issued with the understanding that it is the responsibility of the owner or his/her representative to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project, and incorporated into the project plans and specifications. The owner or his/her representative is responsible for ensuring that the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.
- 4. As of the present date, the findings of this report are valid for the property studied. With the passage of time, changes in the conditions of a property can occur whether they be due to natural processes or to the works of man on this or adjacent properties. Legislation or the broadening of knowledge may result in

September 25, 2008

Project 7-4309

changes in applicable standards. Changes outside of our control may find this report to be invalid, wholly or partially. Therefore, this report should not be relied upon after a period of three (3) years without our review nor is it applicable for any properties other than those studied.

5. Validity of the recommendations contained in this report is also dependent upon the prescribed testing and observation program during the site preparation and construction phases. Our firm assumes no responsibility for construction compliance with these design concepts and recommendations unless we have been retained to perform continuous on-site testing and review during all phases of site preparation, grading, and foundation/slab construction.

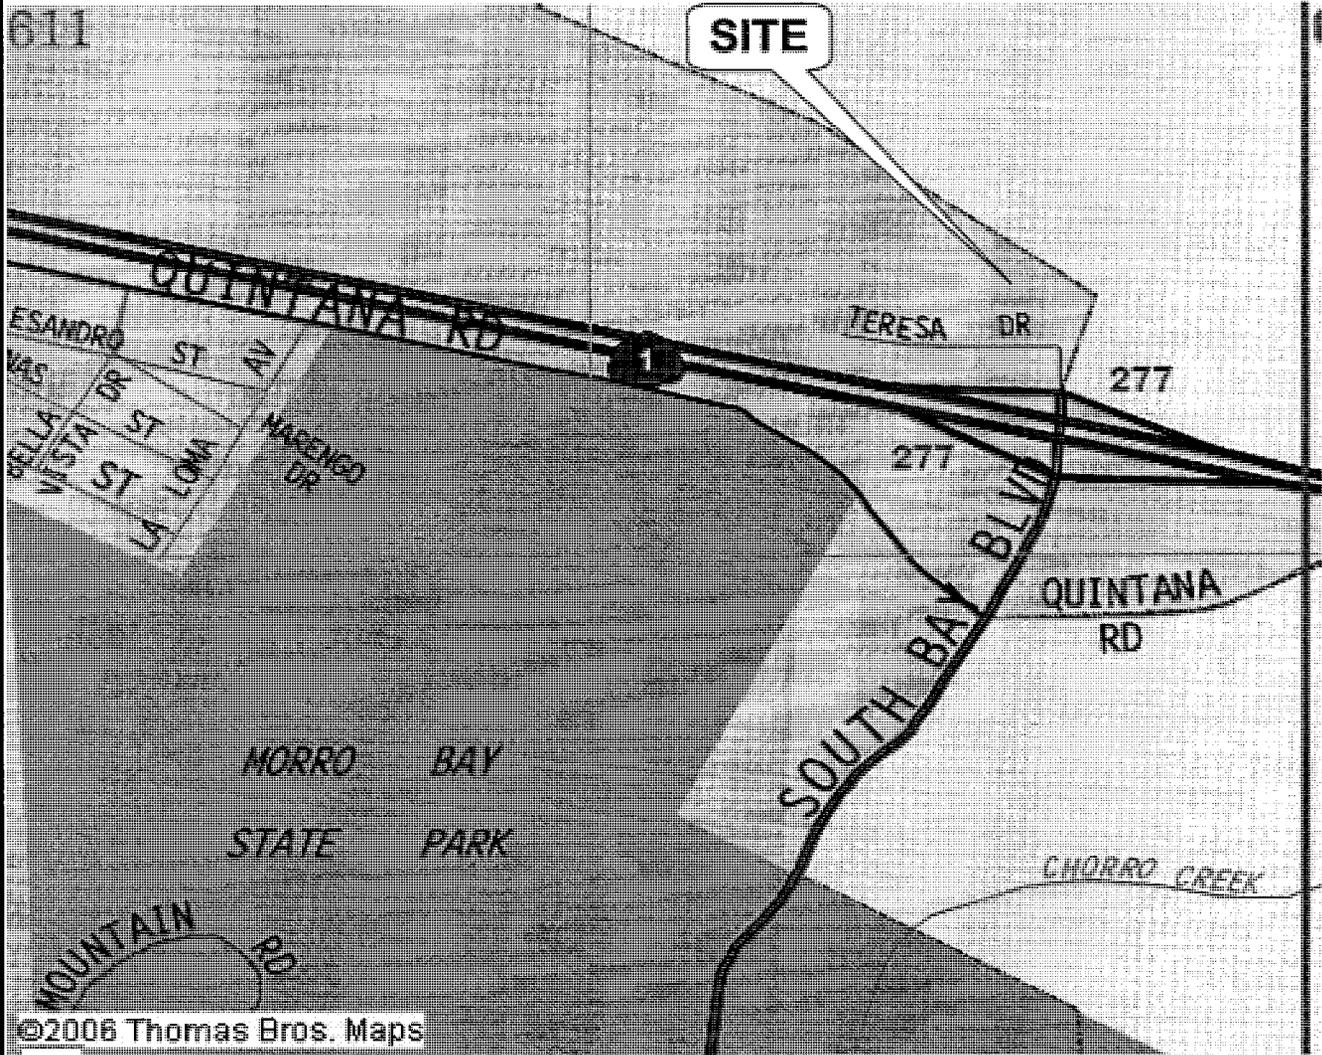

Thank you for the opportunity to have been of service in preparing this report. If you have any questions or require additional assistance, please feel free to contact the undersigned at (805) 543-5493.

Sincerely,  
**GSI SOILS INC.**

Project 7-4309

## FIELD INVESTIGATION

### Test Hole Drilling

The field investigation was conducted on January 24, 2007. Four (4) exploratory borings were drilled at the approximate locations indicated on the Site Plan, Figure 2. The locations of these borings were approximated in the field.

Undisturbed and bulk samples were obtained at various depths during test hole drilling. The undisturbed samples were obtained by driving a 2.4-inch inside diameter sampler into soils. Bulk samples were also obtained during drilling.

### Logs of Boring

A continuous log of soils, as encountered in the borings was recorded at the time of the field investigation, by a Staff Engineer. The Exploration Boring Logs are attached.

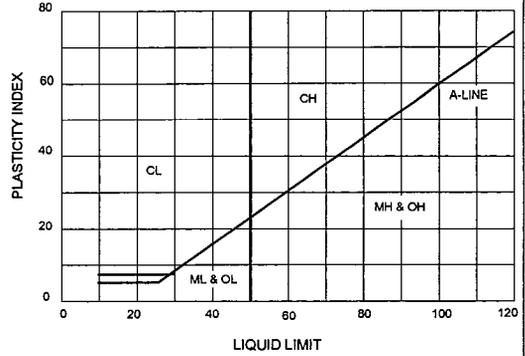

Locations and depth of sampling, in-situ soil dry densities and moisture contents are tabulated in the Boring Logs.

## LABORATORY TESTING

### **Moisture-Density Tests**

The field moisture content, as a percentage of the dry weight of the soil, was determined by weighing samples before and after oven drying. Dry densities, in pounds per cubic foot, were also determined for the undisturbed samples. Results of these determinations are shown in the Exploration Boring Logs.

### **Direct Shear Test**

Direct shear tests were performed on undisturbed samples, to determine strength characteristics of the soil. The test specimens were soaked prior to testing. Results of the shear strength tests are attached.

### **Resistance (R) Value Test**

An R-Value test was estimated based on sieve analysis and plasticity on a bulk sample obtained from boring B-1. The results of the tests indicates that the clay soils have an R-Value of 8.

### **Expansion Index Tests**

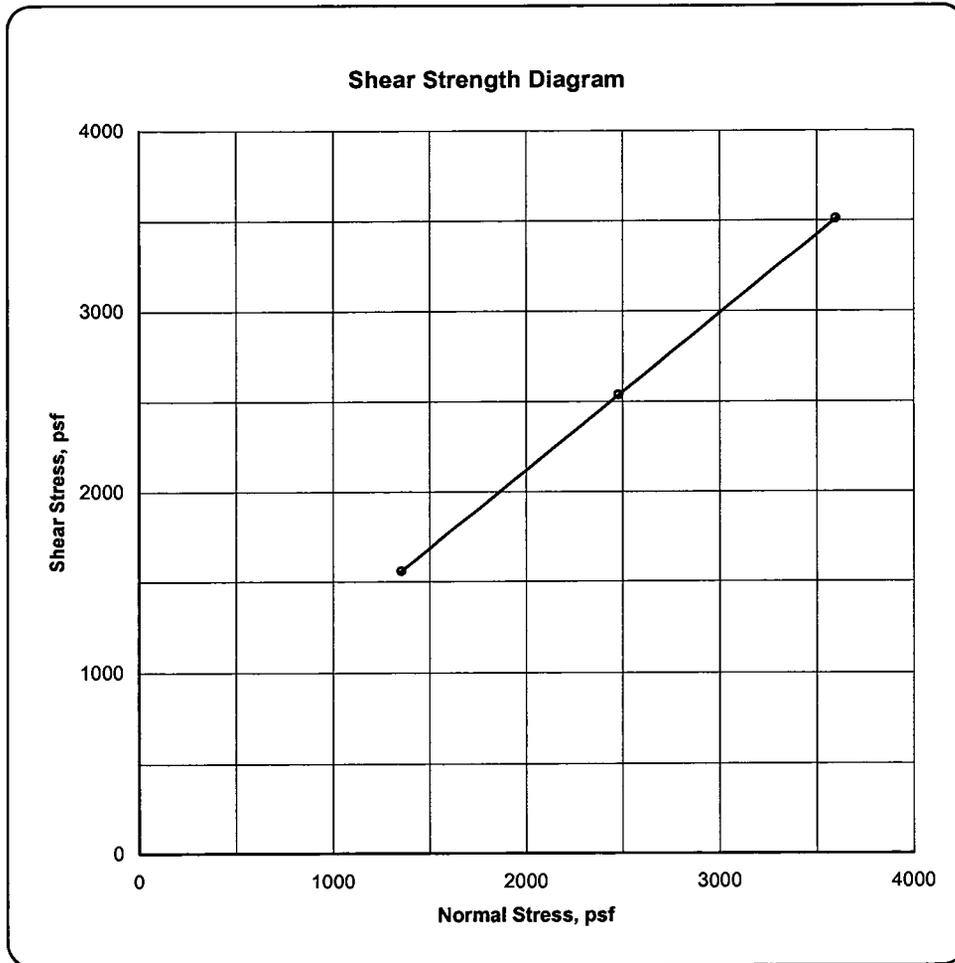

Expansion indices (EI) of 98 to 120 were obtained for the near surface sandy clay soils. The clayey sandstones had EI's of 6 to 14. The test procedures were performed in accordance with Uniform Building Code Standard 29-2.

### **Atterberg Limits**

The liquid limit, plastic limit and plasticity index was determined for selected samples in accordance with ASTM D4318. The results are presented on the boring logs.

# DIRECT SHEAR TEST

ASTM D3080-90 (Modified for unconsolidated-undrained conditions)

Project: SEA SHELL STAFF HOUSING

Project No. 7-4309

Sample Location: B-1 @ 3 feet

Initial Dry Density (pcf) 108.3

Soil Description: **Clayey Sand**

Initial Moisture (%) 13.3

Sample Type: ○ Remolded

**Peak Shear Angle 41**

● Ring

**Cohesion (psf) 380**

## CITY OF MORRO BAY WATER RECLAMATION FACILITY DESIGN-BUILD PROJECT DESIGN / BUILD AGREEMENT

THIS DESIGN/BUILD AGREEMENT is entered into on \_\_\_\_\_, 2018, between the CITY OF MORRO BAY, a general law city and municipal law corporation (City), and **[INSERT DESIGN-BUILDER NAME]**, located at **[address]** **[a \_\_\_\_\_]** (Design/Build Entity).

### RECITALS

- A. The City intends to contract with the Design/Build Entity to design and construct a new Water Reclamation Facility (WRF).
- B. Pursuant to Public Contract Code section 22160 *et seq.* the City is expressly authorized to design and construct the facility on a Design/Build delivery basis.
- C. The City issued a Request for Qualification on October 27, 2017. Statements of Qualifications were due to the City on December 7, 2017.
- D. The City pre-qualified four Design/Build teams, which were notified on \_\_\_\_\_, 2018 of their prequalification.
- E. The City issued a Request for Proposal to the pre-qualified teams on \_\_\_\_\_, 2018, (RFP) with instructions to submit their proposals to the City by \_\_\_\_\_, 2018.
- F. The City issued Addenda to the RFP as listed below:

**[TBD]**

Those Addenda are made part of this agreement as listed in Exhibit B of this Design/Build Contract Agreement.

- G. Final selection interviews were held on **[TBD]**.
- H. Notification of final selection was made on **[TBD]**.
- I. The Design/Build Entity is **[INSERT DESIGN-BUILDER NAME]** The Design/Build Entity has entered into a design contract with **[INSERT ENGINEER NAME]** pursuant to which the Engineer of Record agreed to perform certain design services required by this Agreement.
- J. The documents included in the RFP, and the Design/Build Entity's Proposal dated TBD\_ incorporated in this Agreement, and designated as the Contract Documents, are provided by the City to establish the scope, level of quality and design intent, and the reporting procedures for the development and construction of the entire project.

The Design/Build Entity shall not provide any exceptions to the Cost Plus with Guaranteed Not To Exceed Amount, the Project Milestone Schedule,

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

the program statement, the Performance Requirements, or any other requirement described in the Request for Proposal or contract requirements. Despite incorporating the Design/Build Entity's Statement of Qualifications and Proposal as part of this Design/Build Agreement, the City does not accept any provision of the Proposal that is not in conformance with the criteria of the Request for Proposal.

- K. It is the intent of this Design/Build Agreement that the Design/Build Entity assumes full responsibility for administering, managing, quality control, designing, constructing and commissioning the Project..
- L. The City and Design/Build Entity wish to memorialize the intent of the parties and the terms upon which Design/Build Entity will undertake the Project.

NOW THEREFORE, THE PARTIES AGREE AS FOLLOWS:

### ARTICLE 1 – DEFINITIONS

- 1.0 Definitions. The definitions below shall have the same meaning throughout all of the Contract Documents.
- 1.1 Act of God: An Act of God shall include only the occurrences or conditions defined in Public Contract Code Section 7105.
- 1.2 Agreement (Design/Build Agreement): this Design/Build Agreement and all subsequent amendments and modifications to it. Where the term “Agreement,” or “Contract,” is used in the documents, those terms shall refer to this Design/Build Agreement.”
- 1.3 Applicable Laws: all laws, codes, ordinances, rules and regulations of governmental authorities affecting the Site and the Work.
- 1.4 Engineer or Designer of Record: **[INSERT ENGINEER NAME]** licensed in the State of California and employed or contracted by the Design/Build Entity to design and prepare construction documents for the project and to provide construction phase services during the Project.
- 1.5 Authorized Representatives: see Article 4, Paragraph 4.1, the City’s Representative.
- 1.6 Beneficial Occupancy: City’s occupancy or use of any completed or partially completed portion of the Work. See Article 6, Subparagraph 6.11.3, Beneficial Occupancy.
- 1.7 CEQA: the California Environmental Quality Act, (Public Resources Code section 21000 *et seq.*) and the State CEQA Guidelines 14 CCR 15000 *et seq.*)
- 1.8 Certificate of Compliance: a certificate issued by the City stating the installation of all life safety materials and equipment is in compliance with

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

building and life safety codes. Such equipment includes, but is not limited to: Fire Alarm and Fire Sprinklers, rated construction assemblies, fire exits, paths of egress, etc.

- 1.9 Certificate of Final Completion: a certificate prepared by the Design/Build Entity and forwarded to the City stating that the Design/Build Entity believes in good faith that the Project is complete, including all punch list items, close-out activities and commissioning, and that the Design/Build Entity is entitled to Subparagraph 6.11.7, Final Payment, in accordance with the provisions of Subparagraph 6.11.5, Final Completion.
- 1.10 Change Order: a change to the Design/Build Agreement and/or Contract Documents signed by the Design/Build Entity and the City authorizing a change in the Work, which may also adjust the Guaranteed Not To Exceed Amount and/or the Contract Time, Paragraph 7.1. The Cost Plus with Guaranteed Not To Exceed Amount and Contract Time may be changed only by Change Order.
- 1.11 Change Proposal: a proposal for a Change Order, submitted to the Design/Build Entity by the City, or submitted to the City by the Design/Build Entity on the Design/Build Entity's own initiative.
- 1.12 City of Morro Bay: the City.
- 1.13 Commissioning: a quality process for achieving, validating and documenting that the new facilities and its systems are planned, designed, installed, tested and capable of being operable and maintained to perform in conformity with the Design Requirements.
- 1.14 Construction Documents: the drawings and specifications prepared and sealed by the Architect of Record on behalf of the Design/Build Entity for construction of the Project.
- 1.15 Construction Manager: the individual appointed by the City to serve as a point of contact in coordinating the City's interests.
- 1.16 Contract Documents: those documents set forth in Exhibit B, Contract Documents, all of which, together with this Design/Build Agreement, form the entire agreement between the City and the Design/Build Entity. Any amendments and modifications to the Contract Documents and/or the Design/Build Request for Proposal package must be approved by the City prior to incorporation into this Design/Build Agreement.
- 1.17 Contract Time: see Paragraph 7.1, Contract Time.
- 1.18 Cost Plus: no more than \_\_\_ percent (\_\_\_%) over the Design/Build Entity's actual costs paid by the Design./Build Entity (i) for its direct labor costs and (ii) to procure each type of labor, materials, tools, equipment, and services provided through its subcontractors of any level and material providers, when (i) or (ii) are required to be performed by or on behalf of the Design/Build Entity pursuant to the provisions of the Contract Documents, as more fully described in Article 3, Design/Build Entity's Duties and Responsibilities.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- 1.19 Cost Plus with Guaranteed Not To Exceed Amount: is the maximum contract amount established by Section 3.2.1 of this Agreement as total compensation to the Design/Build Entity for the design and construction of the Project.
- 1.20 Day(s): calendar day or days, unless otherwise specifically designated as a business day. If a day requiring notice or action falls on a weekend or national or state holiday, then the next non-weekend or non-holiday shall be applicable. (Business day(s) are days other than weekend days or national or California holidays.)
- 1.21 Design/Build Entity: **[INSERT DESIGN-BUILDER NAME]**, a California corporation (License No. \_\_\_\_\_ – Classification A) able to provide appropriately licensed construction contracting, and professional architectural and engineering services required hereunder.
- 1.22 Final Completion: the point at which the Work has been completed in accordance with the terms and conditions of the Contract Documents.
- 1.23 Final Certificate of Occupancy: a formal document issued by the City's Building Official granting unconditional approval to occupy all the habitable structures of the Project.
- 1.24 Float: the amount of time difference between the Design/Build Entity's scheduled critical path method (CPM) early completion date and the Final Completion date as shown in the Project Milestone Schedule, **Exhibit A**.
- 1.25 Indemnified Parties: the City and its officers, officials, employees, attorneys, consultants, agents, subcontractors, successors and assigns.
- 1.26 Liquidated Damages: the damages limited to failure to complete the Project on time and payable by the Design/Build Entity to the City in the event the Design/Build Entity does not achieve the Certificates of Final Completion for the Project as required in the Project Milestone Schedule (Exhibit A), or as adjusted by contract change order, as more fully described in Paragraph 7.7, Liquidated Damages.
- 1.27 Notice to Proceed: the notice given by the City to the Design/Build Entity stating that the Design/Build Entity is authorized to begin the design and/or the construction of the Project.
- 1.28 Performance Requirements: the Performance Criteria, Performance Criteria Report, Project Requirements within the RFP, Specifications, and Drawings included in the Request for Proposals and incorporated by reference into this Agreement.
- 1.29 Substantial Completion: a point in time when the work is sufficiently complete in accordance with the Construction Documents so that it can be used for its intended purpose, as evidenced by (i) the issuance of one of more Temporary Certificates or a Final Certificate of Occupancy, for all habitable

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

structures of the Project and (ii) successful submission of all necessary documentation required for the NPDES permit (including UV validation testing results).

- 1.30 Temporary Certificate of Occupancy: a formal document (i) issued by the City's Building Official granting conditional approval to occupy one or more of the habitable structures of the Project and (ii) but subject to corrections, which must all be satisfactorily completed by the Design/Build Entity, as reasonably acceptable to the City's Building Official, prior to the issuance of the Final Certificate of Occupancy.
- 1.31 Work: all labor, materials, tools, equipment, and services required to be performed or provided by the Design/Build Entity pursuant to the provisions of the Contract Documents, as more fully described in Article 3, Design/Build Entity's Duties and Responsibilities.

### **ARTICLE 2 – GENERAL PROVISIONS**

- 2.1 Scope of Work.
  - 2.1.1 The Design/Build Entity shall be responsible for the performance of all design and construction services, and provide all materials, labor, tools, and equipment necessary to complete the work described in and reasonably inferable from the Contract Documents.
- 2.2 Execution, Correlation and Intent:
  - 2.2.1 This Agreement will not be binding on the City until executed by the City's legal representative.
  - 2.2.2 Execution of this Agreement by Design/Build Entity is a representation the Design/Build Entity understands and accepts the methodology under which the work is to be performed and has correlated personal observations with requirements of the Contract Documents.
  - 2.2.3 The intent of the Contract Documents is to include all necessary criteria to establish the scope and quality for completion of the work by Design/Build Entity. The Contract Documents are complementary, and what is required by one shall be as binding as if required by all. Performance by the Design/Build Entity shall be required to the extent consistent with and reasonably inferable from the Contract Documents.
  - 2.2.4 Organization of the Contract Documents and arrangement of the drawings is not intended to control or guide the division or extent of work.
  - 2.2.5 Unless otherwise stated in the Contract Documents, words and phrases shall be interpreted consistent with construction and design industry standards.

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

- 2.2.6 Work shall be accomplished in a workmanship-like manner by workers, laborers, or mechanics especially skilled in the class of work required. Any persons the City may deem incompetent or disorderly shall be promptly removed from the Project by the Design/Build Entity upon written notice from the City, and shall not be reemployed for the duration of the project.
- 2.2.7 As a minimum, work shall be in compliance with applicable laws, codes and ordinances. Higher levels of performance, material, and or function, may be required or reasonably inferred from the Contract Documents.
- 2.3 Use of the City's Contract Documents.
- 2.3.1 The Contract Documents issued by the City are for use solely with respect to this Project. They are not to be used on other projects, or for additions to this Project without the specific written consent of the City. The Design/Build Entity is granted limited license to use and reproduce applicable portions of the Contract Documents for use in the execution of the Work. Design/Build Entity shall not release any information to the public in connection with services performed under this Agreement without advance written permission of the City.
- 2.4 Conflicts in the Contract Documents.
- 2.4.1 The Contract Documents are intended to be complementary and interpreted in harmony so as to avoid conflict. In the event of conflict in the Contract Documents, the precedence shall be as follows:
- .1 Addenda shall govern over other sections of the Contract Documents to the extent specifically noted; subsequent Addenda shall govern over prior Addenda only to the extent specified.
  - .2 This Agreement shall govern over other Contract Documents except for specific modifications stated in amendments to this Agreement and Addenda.
  - .3 In case of conflict between the drawings and the written design guidelines and the specifications, the Design/Build Entity shall obtain written clarification from the City as to the governing document. Such request for Clarification shall be submitted via a formal Request For Clarification (RFC) letter.
  - .4 In the case of conflict within the Performance Requirements, the following shall govern:
    - .1 Schedules, when identified as such, shall govern over all other portions of the drawings.
    - .2 Specific notes shall govern over all other notes and all other portions of the drawings, except schedules described in the

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

preceding sub clause.

- .3 Larger scale drawings shall govern over smaller scale drawings.
- .4 Figured or numerical dimensions shall govern over dimensions obtained by scaling.
- .5 In the case of other conflict within the Performance Requirements, the Design/Build Entity shall obtain written clarification from the City as to the governing document.

2.4.2 The City and Design/Build Entity acknowledge that the Contract Documents may differ in some respects from other documents included in the Design/Build Entity's Technical Proposal upon which Design/Build Entity based its proposal. The City and Design/Build Entity agree that the documents that provide the higher quality supersede any inconsistent versions of these documents.

## 2.5 Clarifications and Additional Instructions.

2.5.1 Conflicts, omissions, errors, interpretation or clarification, insufficiency of detail or explanation in the Contract Documents relative to the timely or material execution of the work shall be immediately brought to the attention of the City in writing and request interpretation, clarification, or furnishing of additional detailed instructions. Such questions shall be resolved and instructions to the Design/Build Entity issued within a reasonable time by the City, whose decision shall be final and conclusive. Should the Design/Build Entity proceed with the work before receipt of instructions from the City, the Design/Build Entity shall make adjustments to conform to the City's instructions. Design/Build Entity shall be solely responsible for any resultant damage, defect or added cost.

2.5.2 The City may furnish additional detailed written instructions to explain the work more fully, and such instructions shall be a part of the Contract Documents requirements. Should additional detailed instructions, in the opinion of the Design/Build Entity, constitute work in excess of the scope of the Work, the Design/Build Entity shall submit written notice to the City within 10 calendar days following receipt of such instructions, and in any event prior to commencement of the work on it. The City will then consider the notice; and, if in the City's judgment it is justified, the City's instructions will be revised for the extra work authorized.

## ARTICLE 3 – DESIGN/BUILD ENTITY'S DUTIES AND RESPONSIBILITIES

### 3.1 Performance of Work.

3.1.1 Design/Build Entity shall be responsible for achieving the Occupancy and Final Completion Milestones dates in the Project Milestone Schedule as shown in **Exhibit A**. The schedule may be

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

modified from time to time pursuant to the provisions of the Contract Documents.

## 3.2 Design/Build Entity's Responsibilities:

3.2.1 Design/Build Entity further agrees to design and construct the Project in sole consideration for the City's payment of the Cost Plus with Guaranteed Not To Exceed Amount of \_\_\_\_\_ **Million Dollars (\$ \_\_\_\_,000,000)**. In the event any or all costs incurred by the Design/Build Entity in the performance of all work required to satisfactorily complete the Project, as required by the Contract Documents, exceed the Guaranteed Not To Exceed Amount, such costs shall be the sole responsibility of the Design/Build Entity and not subject to compensation or reimbursement by the City. The duties and responsibilities include, but are not limited to, the following tasks:

### 3.2.2 General Responsibilities

Utilize the City's Management Information System (MIS), Procore, to manage the project, and provide information to the City's Project Management Team.

The Management Information System (MIS), shall facilitate documentation and exchange of project information including, but not limited to, Request for Clarifications (RFC's), Substitutions, Deviations from Design Requirements, Change Orders, Progress Payments, Submittals, Schedule(s), Drawings, etc. Design/Build Entity shall meet with the City's Project Management Team to determine specific requirements for the implementation of the MIS.

Pursuant to CEQA, an final environmental impact report has been certified, as **has/will be** a final environmental impact statement or other document analyzing environmental impacts per the National Environmental Policy Act. The Design/Build Entity shall comply with all the mitigation measures required by those documents.

The Design/Build Entity is required to deliver to the City any and all design materials. Those materials include, but are not limited to: calculations, preliminary drawings, construction drawings, shop drawings, samples, electronic media data, tenant improvement documents, sketches, illustrations, specifications, descriptions, models, and other information developed, prepared, furnished, or delivered in the prosecution of the design work.

3.2.3 Design Phase Responsibilities -The Design Phase includes the preparation of the design and construction Documents for the project including, but not limited, to all necessary architectural design, specialty consultant services, civil engineering, structural engineering, mechanical engineering, plumbing , and electrical engineering and whatever else may be necessary to ensure a full

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

and complete process that meets, at a minimum, the Performance Requirements. These responsibilities shall also include all relevant plan submittals and permitting activities, for permits and approvals required for construction activities related to the Project.

- .1 Systems Confirmation Phase
  - .a Following receipt of a Notice to Proceed, the Design/Build Entity shall meet weekly with City and provide such information as necessary to inform the City of the project design status, and obtain City input and approval regarding design issues. The Design/Build Entity shall be responsible for scheduling and coordinating the participation in these meetings. The Design/Build Entity shall proceed to develop System Confirmation documents. These documents shall depict the type and quality of materials, equipment, design, layout and general coordination of each major building system (i.e.: structural, exterior closure, mechanical, plumbing, electrical, etc.) in sufficient detail to confirm compliance with the Performance Requirements. The System Confirmation documents are considered to be part of and submitted with the schematic design, design development 60%, and construction document submittals. For further details on submittal requirements refer to Exhibit E- Project Schedule and Project Management Submittals.
  - .b Conduct value engineering analysis on selected building components to determine best value based on initial cost, life expectancy, cost of operation and maintenance. The value engineering analysis shall be performed concurrent with the System Confirmation effort.
  - .c Prepare and update detailed estimates of the cost of construction at the 30%, 60% and 90% design phases to substantiate that the project will not exceed the contracted Guaranteed Not To Exceed Amount.
  - .d Monthly prepare and update the detailed construction schedule to confirm project delivery within the stipulated milestones, as defined in the Contract Documents.
  - .e Provide services to develop a final space program and prepare plan layouts to reflect the requirements of all department users.
  - .f Participate in the Systems Confirmation Conference with the City and its consultants within 30 calendar days after the Notice of Award, prior to the development of the Construction Documents. The Design/Build Entity shall be responsible for scheduling and coordinating the participation in these meetings. The Systems Confirmation Conference is intended to obtain City approval for design approach, equipment

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

selection, and system/building layout prior to detailed design. The deliverables are defined in the appropriate sections of the Contract Documents.

## .2 Construction Documents Phase

- .a Prepare Construction Documents for the entire Project in full compliance with all applicable building codes, ordinances, and other regulatory authorities. The Construction Documents shall at a minimum comply with all applicable California State Building Codes, to include but not be limited to, Title 8 (Industrial Relations), Title 17 (Public Health), and Title 24 (Building Standards). Construction Documents will also need to show Best Management Practices for storm water pollution prevention during and after construction of project. The completed contract documents are to be delivered to City and shall consist of the following:

Drawings – Provide one reproducible original, and 10 printed full-size copies and 10 half-size copies of all approved construction document drawings. Provide one copy of all approved construction document drawings on compact disks (CD) using:

Computer-Aided Design (CAD) software, using the latest version of AutoCAD.

Specifications – Where articles, materials, and equipment are identified by brand names, at least two names shall be used, and such names shall be followed by the words “or equal”. Specifications shall not contain restrictions that will limit competitive bids. Exceptions shall only be as permitted by Public Contract Code Section 3400.

Provide original and 10 printed copies of approved specifications, bound and organized. Provide approved specifications on compact disks for all sections for all work applicable to the Project; in a format complying with the current edition of the Construction Specifications Institute’s “Master Format”; as directed by the City and in accordance with the following:

- 1) Electronic computer software in Microsoft Word, latest version for Windows.
- 2) All disks provided shall be clearly labeled to indicate files contained and date produced.

- .b Upon receipt of the Notice to Proceed, the Design/Build Entity shall instruct the Engineer of Record to commence with design and preparation of the construction documents. The construction documents shall provide information customarily

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

necessary in documents for projects of similar size, complexity, and quality.

The construction documents shall include all information required by the building trades to complete the construction of the Project, other than such details customarily developed by others during construction. The Design/Build Entity shall be responsible to design, prepare construction documents and coordinate all disciplines for the entire project including, but not limited to: all structural elements, building enclosure, roofing, waterproofing, site work, structures, parking areas, utilities, and all building systems.

Responsibilities also include the design, preparation of construction documents and all coordination necessary for accommodation of interior space construction, fixtures and equipment coordination, finishes, infrastructure, and equipment, all to be provided and installed by the Design/Build Entity. Refer to paragraph 3.2.4, Construction Phase Responsibilities, for further fixtures and equipment requirements. The project's design shall meet or exceed the design and performance criteria stipulated in the Design Requirements.

- .c The City's review of the construction documents shall be conducted in accordance with the approved Design/Build Entity's Baseline Schedule with procedures set forth in Article 7, Schedule. Such review shall not relieve the Design/Build Entity from its responsibilities under this Agreement. Such review shall not be deemed an approval or waiver by the City of any deviation from, or of the Design/Build Entity's failure to comply with, any provision or requirement of the Contract Documents, unless such deviation or failure has been identified as such in writing in the document submitted by the Design/Build Entity and approved by the City.
- .d However, it is acknowledged by the parties hereto that inherent in a Design/Build concept, the production and review of construction documents may be a continuing process with portions thereof completed at different times. However, during Project start-up the Design/Build Entity will determine the number of design packages with the City and stipulate the number in the Design/Build Entity's Project Management Plan. The Design/Build Entity's Baseline Schedule shall indicate the times for the City to review the completion of each such portion of the construction documents and a reasonable time for review of same. The minimum review time for major milestone submittals shall not be less than 10 working days.
- .e The Design/Build Entity shall submit completed packages of the construction documents, in the quantities required by the City Community Development Department and other

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

applicable authorities having jurisdiction, at the times indicated on the Design/Build Entity's Baseline Schedule. Review meetings between the Design/Build Entity and the City to review the construction document packages, shall be scheduled and held so as not to delay the Work. After reviewing the construction documents package for conformance to the Contract Documents and applicable codes, in his/her governmental capacity, the City's Building Official will issue a Building Permit to the Design/Build Entity. The issuance of the Building Permit or Notice to Proceed does not relieve the Design/Build Entity of satisfactorily and timely complying with all provisions of the Contract Document.

- .f The construction documents for hazardous and/or toxic abatement efforts and demolition activities shall be of sufficient clarity and detail and shall be submitted to the City and other applicable authorities having jurisdiction for review.

### .3 Ownership of Design Materials

- .a All materials and documents developed in the performance of this Agreement are the property of the City. The City shall have unlimited rights, for the benefit of the City, in all drawings, designs, specifications, notes, and other work developed in the performance of this Agreement, including the right to use same on any other City work at no additional cost to the City.

Design/Build Entity agrees to and does hereby grant to the City a royalty-free license to all such data that Design/Build Entity may cover by copyright and to all designs as to which Design/Build Entity may assert any rights or establish any claim under the patent or copyright laws. The Design/Build Entity for a period of three years after completion of the Project agrees to furnish and to provide access to the originals or copies of all such materials upon the request of the City.

The City agrees to make no demand on Design/Build Entity and indemnifies the Design/Build Entity of any damages for responsibility for the City's use of such materials for any other City work that is not the subject of an agreement between the City and Design/Build Entity for such use.

- .b The Design/Build Entity shall perform the work required under this Agreement with Computer-Aided Design (CAD) software, using the latest version of AutoCAD, and shall deliver to the City the compact disks containing the electronic files of all approved construction document drawings and as constructed Record Drawings.
- .c The City does not assume any obligation to employ the

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

Design/Build Entity's services or pay Design/Build Entity royalties of any type as to future programs that may result from the work performed under this Agreement.

## .4 Design Material Errors

The Design/Build Entity shall be solely responsible for all design errors, including, but not limited to: errors, inconsistencies or omissions in the construction documents, and errors, omissions and inconsistencies that do not conform to the minimum standards of the Contract Requirements and the Performance Requirements. The Design/Build Entity shall take field measurements and verify field conditions and shall carefully compare such field conditions and other information known to the Design/Build Entity from the Contract Requirements and the Performance Requirements before commencing activities.

## 3.2.4 Construction Phase Responsibilities

The Design/Build Entity shall provide all supervision, labor, materials, equipment, temporary utility services and facilities necessary to design and construct the entire fully-functional Project, as required by the Contract Documents, including, but not limited to:

- .1 Prepare an existing conditions survey of the all surrounding and adjacent properties, including streets and observable and recorded utilities, prior to the start of construction. The survey shall professionally document existing conditions of surrounding and adjacent properties using a professional video/filming service hired by the Design/Build Entity and approved by the City prior to the start of work. Videotape shall be on DVD and contain detailed audio documentary describing property, location and existing conditions in areas of view. Design/Build Entity will endeavor to gain access to non-City owned properties. Submit three copies of the videotapes to the City 10 days prior to the start of construction.
- .2 Competitively bid all work not performed by the Design/Build Entity or the Designated Subcontractors.
  - .a Provide public notice of the availability of work to be subcontracted in accordance with Section 22160 *et seq.* of the Public Contract Code.
  - .b The contents of the notice shall state the time and place for receiving and opening of sealed bids and general description of the work in accordance with Section 22160 *et seq.* of the Public Contract Code.
  - .c As authorized by the City, establish reasonable pre-qualification criteria and standards. See Public Contract Code Section 22160 *et seq.*

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- .d Provided that the subcontracted work be awarded to the lowest responsible bidder, subject to Design/Build Entity's right in its sole discretion, to reject all bids and re-bid any subcontract bid package in the event that all bids exceed Design/Build Entity's budget for subcontract bid package.
- .3 If a discovery is made of items of archaeological interest on site during excavation activities, the Design/Build Entity shall immediately cease excavation in the area of discovery and shall not continue until ordered by the Construction Manager. Design/Build Entity shall cooperate with and provide access to the City's Archaeologist and other monitoring services
- .4 Except as otherwise specifically approved by the City, prepare and submit construction progress photographs monthly from groundbreaking through project completion, within three calendar days of the date of the Design/Build Entity's application for progress payment. To the extent practicable, make photographs at approximately the same time of day through progress of the work. When inclement weather is anticipated, consult with the City and determine acceptable alternative arrangements.

Identify each location by word description, by marked drawing, or by such other means as acceptable to the City, to enable future photographs to be taken from the same position. When so directed by the City, because of the stage of construction, change one or more of the locations to new locations inside or outside the buildings. Make each photograph clear, in focus, with high resolution and sharpness, and with minimum distortion.

The Design/Build Entity shall retain the digital copies for at least four years following Date of Substantial Completion, and to provide prints to the City during that period at the prevailing commercial rates for such prints. Do not permit prints to be issued for any other purpose without specific written approval from the City.

### 3.3 Standards of Performance.

The Work on the project shall be performed in accordance with the professional standards and quality of care applicable to projects, buildings or work of similar size, complexity, quality and scope constructed within a California urban environment.

- 3.3.1 The Design/Build Entity shall assign **[INSERT NAME]**, Project Manager, as previously approved by the City. The Project Manager shall remain on the project through Final Completion. The Design/Build Entity shall make assignments of consultants and subcontractors as detailed in the Proposal.

The Design/Build Entity may make additions or substitutions to personnel and responsibilities provided they are suitably qualified and are approved by the City in writing. In the event that personnel

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

assigned by the Design/Build Entity fail to meet the professional standards required or are persistently uncooperative, in the sole discretion of the City, the City may request substitution of such personnel. Once notice of such request has been received, the Design/Build Entity shall have 20 business days to substitute such other personnel as approved by the City.

3.3.2 The Design/Build Entity shall employ a competent, on-site project team including, but not limited to, Project Manager, superintendent, and necessary assistants who shall be in attendance at the Project Site at all times during the construction of the project. The Project Manager shall represent the Design/Build Entity and communications given to and by the Project Manager shall be as binding as if given directly to and by the Design/Build Entity. The Design/Build Entity shall confirm all communications in writing and provide a matrix of signature authority limitations for its team.

3.3.3 At any other time when the Project Manager is absent from the Project Site because no work is being performed, the Project Manager shall nevertheless keep the City advised of the Project Manager's whereabouts so that the Project Manager may readily be reached and available for consultation at the Project Site at any time.

### 3.4 Applicable Laws and Codes.

The Design/Build Entity shall comply with all applicable laws, codes, regulations, City Resolutions and City ordinances and shall give notices as applicable. Design/Build Entity shall prepare and file all documents required to obtain the necessary approvals of governmental authorities having jurisdiction over the work and shall secure and pay as part of the Guaranteed Not To Exceed Amount, for plan check and permits fees, licenses and inspections required.

3.4.1 The Design/Build Entity shall comply with the current adopted edition of the California Building Code ("CBC"), including any updates following the date the Design/Build Entity submits the project for plan check. Whenever the Contract Documents require higher standards than the minimum required by applicable laws, the Contract Documents shall take priority.

3.4.2 Design/Build Entity shall submit for review to the City and to other authorities having jurisdiction required calculations and other materials demonstrating the energy use of proposed systems and sustainability.

### 3.5 Permits, Fees and Notices.

3.5.1 Unless otherwise provided in the Contract Documents, the Design/Build Entity shall be responsible for obtaining the required permits, governmental fees, licenses, inspections, approvals, notices and actions necessary to complete the Work and to prepare all documents customarily required for regulatory agency approvals. City

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

shall be responsible for the cost of the building permit and such cost shall not be included in the Guaranteed Not To Exceed Amount. Design/Build Entity shall provide a minimum of 10 working days' notice to City to cut checks for the building permit.

- 3.5.2 Design/Build Entity shall promptly, notify the City, in writing, of variances observed between the Contract Documents and applicable laws. The Design/Build Entity shall bear responsibility for any attributable costs for work performed, without prior notice to the City, known to be contrary to applicable laws.
  - 3.5.3 The Design/Build Entity may be subject to City, or state laws, rules, or regulations pertaining to building permits or regulating the design or construction of buildings upon City property, and shall be solely responsible for meeting these requirements.
  - 3.5.4 The Design/Build Entity shall pay any site de-watering fees and will cooperate with the City in any reasonable measure to limit the quantity of de-watering.
  - 3.5.5 The City shall pay all utility assessments and connection fees levied by the City, or other utility service provider.
- 3.6 Use of Project Site.
- 3.6.1 The Design/Build Entity shall confine operations at the Project Site to areas permitted by law, ordinances, permits, and the Contract Documents.
  - 3.6.2 The Design/Build Entity shall perform no operations of any nature on or beyond the limits of Work or premises, except as such operations are authorized in the Contract Documents, or authorized by the City.
  - 3.6.3 The Design/Build Entity shall provide and maintain a temporary construction fence and suitable temporary barriers as required preventing public entry; protecting the work and existing facilities, persons, and trees and plants from damage or injury from construction operations. Temporary barriers shall be maintained in a structurally sound condition and neat appearance.
  - 3.6.4 If regulatory requirements necessitate construction of temporary barriers, barricades, or pedestrian walkways not indicated or specified in the Construction Documents, then the Design/Build Entity shall construct or provide same, as required. at no increase in the Guaranteed Not To Exceed Amount. The Design/Build Entity shall also paint, at no increase in the Guaranteed Not to Exceed Amount, such items in a color selected by the City's Representative.
- 3.7 Cutting and Patching

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

- 3.7.1 The Design/Build Entity shall be responsible for cutting, fitting or patching required to complete the Work.
- 3.7.2 The Design/Build Entity shall not damage nor endanger the Work by cutting, patching or otherwise altering the construction, and shall not cut nor otherwise alter the construction without prior written consent of the City.
- 3.8 Cleaning
- 3.8.1 The Design/Build Entity shall keep the Project Site and surrounding areas free from waste materials and/or rubbish caused by operations under the Agreement and at other times when directed by the City. At all times while finish work is being accomplished, floors shall be kept clean, free of dust, construction debris and trash. Prior to issuance of the Certificate of Final Completion, the Design/Build Entity shall remove from the Project Site the Design/Build Entity's tools, construction equipment, machinery, and any waste materials not previously disposed of, leaving the Project site thoroughly clean, and ready for the City's final inspection.
- 3.8.2 If the Design/Build Entity fails to clean up as provided in the Contract Documents, the City may do so and the cost thereof charged to the Design/Build Entity.
- 3.9 Site Availability.
- 3.9.1 The City shall turn over the Site to the Design/Build Entity as described in the Notice to Proceed and as further described in EXHIBIT A – PROJECT MILESTONE SCHEDULE, at which time the Design/Build Entity shall be obligated to take control and responsibility. The Design/Build Entity shall provide the City, Construction Manager and other City consultants with continuous access to the Site.
- 3.9.2 The Design/Build Entity shall occupy the least amount of parking spaces at all times for use by the public during regular operating hours of the facilities at the site. Temporary parking facilities shall meet all applicable regulatory requirements applicable to design and construction. Design/Build Entity shall be responsible for all permits, design, and construction required including, but not limited to lighting, access, signage, handicap accessibility, and maintenance.
- 3.10 Site Conditions.
- 3.10.1 The Design/Build Entity represents it has taken the necessary steps to ascertain the nature, location and extent of the Work, and it has investigated and satisfied itself as to the general and local conditions which are applicable to the Work, such as:
- (a) conditions bearing on transportation, disposal, handling and storage of materials;

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- (b) the availability of labor, water, power and roads;
- (c) normal weather conditions;
- (d) physical conditions at the Site;
- (e) the conditions of the ground;
- (f) the character of equipment and facilities needed prior to and during the performance of the Work.

3.10.2 To the extent the Design/Build Entity encounters subsurface conditions or hazardous materials, which differ materially from that actually known by the Design/Build Entity, or from those ordinarily known to exist or could have been reasonably discovered within the time permitted during the Request for Proposals, or generally recognized as inherent in the area, then notice by the Design/Build Entity shall be immediately given to the City, before conditions are disturbed, and in no event later than two business days after the first observance of the conditions. If such conditions could not have been reasonably identified by Design/Build Entity's site investigations and available existing data, and the Design/Build Entity incurs significant additional costs or delays as a result of such concealed conditions, then such conditions may be the subject of a Change Proposal.

If any existing utilities or services are disturbed, disconnected or damaged during construction, then the Design/Build Entity shall be responsible, at no additional cost or time to the City, for all expenses and consequential damages of whatever nature arising from such disturbance or the replacement or repair thereof and shall repair such items as required to maintain continuing service, including emergency repairs.

3.10.3 The Design/Build Entity is responsible for foreseeable site conditions and toxic materials to the extent described in the Contract Documents or could be reasonably inferred by the Design/Build Entity based on its and its representative's experience and expertise on similar projects in urban areas.

### 3.11 Hazardous Materials.

Any hazardous materials that are encountered beyond those described in the Contract Documents or Proposal Requirements, or which reasonably could not have been discovered within the time permitted or the Design/Build Entity to prepare its Proposal, may properly be the subject of a Change Proposal. The City agrees the Design/Build Entity cannot be considered a hazardous materials generator of any such materials in existence on the Site at the time it is given possession of the Site.

3.11.1 "Hazardous materials" means any substance, the presence of which requires investigation or remediation under any federal, state or local law, statute, regulation, ordinance, order, action, policy or common law; which is or becomes defined as a "hazardous waste," "hazardous substance," pollutant or contaminant under any federal, state or local law, statute, regulation, rule or ordinance or

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

amendments thereto, including, without limitations, the Comprehensive Environmental Response, Compensation and Liability Act, 42 U.S.C. Section 9601 *et seq.* ("CERCLA"), as amended, or the Resource, Conservation and Recovery Act, as amended, 42 U.S.C. Section 6901 *et seq.* ("RCRA"); which is petroleum, including crude oil or any fraction thereof not otherwise designated as a "hazardous substance" under CERCLA, including without limitation gasoline, diesel fuel or other petroleum hydrocarbons; which is toxic, explosive, corrosive, flammable, infectious, radioactive, carcinogenic, mutagenic, or otherwise hazardous and is or becomes regulated by any regulatory agency or instrumentality or the City; the presence of which on the Site causes or threatens to cause a nuisance upon the Site or to the adjacent properties or poses or threatens to pose a hazard to the health or safety of persons on or about the Site; the presence of which on adjacent properties could constitute a trespass by the Design/Build Entity or the City; or as defined in the California Health and Safety Code.

3.11.2 "Environmental Requirements" means all applicable laws, statutes, regulations, rules, ordinances, codes, licenses, permits, orders and similar items of all governmental agencies or other instrumentality's of the State of California and United States and all applicable judicial, administrative and regulatory decrees, judgments and orders relating to the protection of human health or the environment, including, without limitation: all requirements, including but not limited to, those pertaining to reporting, licensing, permitting, investigation and remediation of emissions, discharges, releases or threatened releases of hazardous materials into the air, surface water, ground water or land, or relating to the manufacture, processing, distribution, use, treatment, storage, disposal, transport or handling of hazardous materials; and all requirements pertaining to the protection of the health and safety of employees or the public.

3.11.3 The indemnification provision of the Agreement, Paragraph 12.2, Indemnification, is applicable to this paragraph in its entirety.

3.12 Shop Drawings, Product Data, Samples, Materials, and Equipment.

3.12.1 Shop drawings means drawings, submitted to Design/Build Entity by, subcontractors, manufacturers, supplier or distributors showing in detail the proposed fabrication and assembly of building elements and the installation (i.e., form, fit, and attachment details) of materials or equipment.

3.12.2 Design/Build Entity shall coordinate all submittals and review them for accuracy, completeness, and compliance with the requirements of the Contract Documents and the Design/Build Entity's construction documents, and shall indicate its approval thereon as evidence of such coordination and review.

3.12.3 Materials and equipment incorporated in the Work shall match the

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

approved samples within tolerances appropriate to the items, and as may be described in the Design Requirements.

3.12.4 Prior to placement of material orders or start of component fabrication, the Design/Build Entity shall submit to the City all shop drawings approved by the Architect of Record and samples of submittals that relate to finish materials and products.

3.12.5 Wherever the name or brand of manufacturer or an article is listed in the Contract Documents, it is to be used in the Work as the standard. Any variation in quality must be approved by the City.

### **3.13 [Intentionally left blank]**

### **3.14 Site Conditions.**

3.14.1 The Design/Build Entity is responsible for assessing the site conditions prior to start of design work. Preliminary findings that will impact the design work must be notified to the City immediately. Design/Build Entity shall be responsible to verify the accuracy of the information provided and, at its cost, obtain any additional measurements, and verifications.

3.14.2 The Design/Build Entity shall verify the location and depth (elevation) of all existing utilities and services before performing any excavation Work.

3.14.3 The Design/Build Entity shall obtain, and pay for, the services of geotechnical engineers licensed in the State of California and other consultants to provide services deemed necessary by the Design/Build Entity. Such services may include reports, test borings, test pits, soil bearing values, percolation tests, air and water pollution tests, ground corrosion and resistivity tests, and other necessary operations for determining subsoil, air and water conditions, with reports and appropriate professional interpretations and recommendations thereof.

### **3.15 Meetings and Reports.**

3.15.1 Prior to commencement of the work, the Design/Build Entity shall attend a Project Kick-off meeting, at a time and a place selected by the City's Representative, to discuss procedures to be followed during the course of the work. Design/Build Entity shall follow the procedures as set forth by the City's Representative and as provided in the Design/Build Entity's procedure manual to be supplied at the Kick-off conference. The purpose of the meeting will be to introduce the City's key personnel and to review the contract provisions and any other items pertaining to the project.

3.15.2 Once a week, or at such interval as mutually agreed by the parties, the City's Representative will meet with the Design/Build Entity to review the overall project progress, the status of the design and/or

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

construction, and to discuss any problems that may arise. The Design/Build Entity and the Architect of Record shall attend all progress meetings. Subconsultants, Subcontractors and Vendor Representatives shall attend the progress meetings as appropriate to the particular stage of the work. The Design Build Entity shall prepare and submit written reports to be presented at these weekly meetings of the progress and quality of Work.

3.15.3 Each month the Design/Build Entity shall attend a payment meeting with the City's Representative to agree on the percentage of the work completed during the current month and establishes an amount to be requested in the Application for Payment.

3.15.4 The Design/Build Entity shall prepare and submit to the City, during design completion, the construction document phase, and the construction phase, monthly reports on the Work accomplished during the prior monthly period. Such reports shall be prepared in a manner and in a format approved by the City. One electronic and four bound copies of the Reports shall be furnished at the time of submission of each monthly application for payment. The monthly report shall also set forth the Design/Build Entity's projected progress for the forthcoming month.

3.15.5 Thirty days prior to the estimated final completion, the Design/Build Entity shall hold a meeting to review maintenance manuals, guarantees, close-out submittals, bonds, and service contracts for materials and equipment. Implement repair and replacement of defective items, and extend service and maintenance contracts as desired by the City.

3.16 Other Reports.

3.16.1 The Design/Build Entity will cooperate with the City, and as may be requested, assist in preparing periodic project reports required by the City Council, the City's Project Management team, or other City agencies as required.

3.17 Notices of Labor Disputes.

3.17.1 If Design/Build Entity has knowledge that any actual or potential labor dispute is delaying or threatens to delay the timely performance of the Work, then Design/Build Entity shall immediately give notice including all relevant information to the City. Design/Build Entity shall refer to the Project Labor Agreement for additional requirements.

3.17.2 Design/Build Entity agrees to insert the substance of this Article including this Clause in any subcontract to which a labor dispute may delay the timely performance of the Work, except that each subcontract shall provide that in the event its timely performance is delayed or threatened by delay, by any actual, or potential labor dispute, the subcontractor shall immediately notify the next higher tier subcontractor or Design/Build Entity, as the case may be, of all

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

relevant information concerning the dispute.

## 3.18 Guarantee.

3.18.1 The Design/Build Entity unconditionally guarantees the Work will be completed in accordance with the requirements of the Contract Documents, and will remain free of defects in workmanship and materials for a period of one year from the date of Final Completion, unless a longer guarantee period is specifically called for in the Contract Documents. For equipment or building components started in operation prior to Final Completion, the Design/Build Entity shall, at no additional cost to the City, provide extended guarantees such that the guarantee period will be in force for the full year after Final Completion.

The Design/Build Entity shall repair or replace any and all work, together with any adjacent work that may have been damaged or displaced, which was not in accordance with the requirements of the Contract Documents, or that may be defective in its workmanship or material within the guarantee period specified in the Contract Documents, without any expense whatsoever to the City; ordinary wear and tear and abuse excepted.

3.18.2 The Design/Build Entity further agrees, within seven days after being notified in writing by the City, of any work not in accordance with the requirements of the Contract Documents or any defects in the Work, that the Design/Build Entity shall commence and execute, with due diligence, all work necessary to fulfill the terms of the guarantee. If the City finds that the Design/Build Entity fails to perform any of the work under the guarantee, then the City will proceed to have the work completed at the Design/Build Entity's expense and the Design/Build Entity will pay costs of the work upon demand. The City will be entitled to all costs, including reasonable attorney's fees necessarily incurred upon the Design/Build Entity's refusal to pay the above costs.

3.18.3 Notwithstanding the foregoing subparagraph, in the event of an emergency constituting an immediate hazard to health or safety of City employees, property, or licensees, the City may undertake, at the Design/Build Entity's expense and without prior notice, all work necessary to correct such hazardous condition(s) when it is caused by work of the Design/Build Entity not being in accordance with the requirements of the Contract Documents.

## 3.19 Warranty.

3.19.1 The Design/Build Entity warrants to the City that any and all materials, equipment and furnishings incorporated in the Work will be of good quality and new unless otherwise required or permitted by the Contract Documents. Work not conforming to these requirements, including substitutions not properly approved and authorized, may be considered defective. The foregoing warranty excludes improper operation, or normal wear and tear under normal

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

usage under the control of the City. Such warranty shall exclude warranties relating to design, warranty of fitness, and any other express or implied warranties other than as set forth herein or in the Contract Documents; provided, however, that the foregoing shall not impair the rights of the City to maintain an action for breach of contract against the Design/Build Entity.

### **3.20 Patents, Trademarks, and Copyrights.**

3.20.1 The Design/Build Entity shall pay, as part of the Guaranteed Not To Exceed Amount, all applicable royalties and license fees on any and all matters arising in connection with the Work. The Design/Build Entity shall defend all suits or claims for infringement of patent, trademark, and copyrights against the indemnified parties, and shall indemnify, defend, and hold harmless the indemnified parties from any claims, causes of action, losses, or costs related to any and all matters arising in connection with Work on the Project (such costs to be paid as part of the Guaranteed Not To Exceed Amount), except with respect to any particular design process or the product of a particular manufacturer or manufacturers specified and required by the City, other than pursuant to the recommendation or suggestion of the Design/Build Entity; provided, however, if the Design/Build Entity has reason to believe that the design, process, or product so specified is an infringement of a patent, the Design/Build Entity shall be responsible for any loss resulting unless the Design/Build Entity has provided the City with prompt written notice of the Design/Build Entity's belief, and the City has nevertheless elected to go forward with such design, process, or product so specified.

### **3.21 Taxes and Business License.**

3.21.1 The Design/Build Entity shall pay all applicable taxes for the Work, or portions thereof provided by the Design/Build Entity, which were legally enacted as of 30 days prior to the submission of the Design/Build Entity's Request for Proposal, whether or not yet effective or merely scheduled to go into effect. Any federal, state, or local taxes payable on any materials, labor or any other thing to be furnished by Design/Build Entity under the Contract Documents and in effect 30 days prior to the submission of the Design/Build Entity's Request for Proposal shall be included in the Guaranteed Not To Exceed Amount and paid by Design/Build Entity. Design/Build Entity must procure a City Business Tax Certificate before or during the construction of work.

### **3.22 Tests and Inspections.**

3.22.1 The Design/Build Entity shall be responsible for designating a Quality Assurance Manager assigned to the Project. The Quality Assurance Manager shall be subject to approval by the City. The Design/Build Entity shall provide the City with the detailed qualifications of the Quality Assurance Manager, including but not limited to, a description of previous relevant project experience, and all training, licensing and

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

certifications.

The Design/Build Entity shall be responsible for requesting and scheduling all tests and inspections necessary to ensure the quality of the Work are in accordance with the terms of the Contract Documents. The Design/Build Entity shall at all-time permit the City and its agents, inspectors, officers, and employees to visit the Project Site and inspect the Work and such other locations where work is in preparation. This obligation shall include maintaining proper facilities and safe access for such inspection. When the Contract Documents require a portion of the work to be tested, such portion of work shall not be covered up until inspected and approved. The Design/Build Entity shall be solely responsible for notifying the City where and when the work is ready for inspection and testing. The City shall provide inspectors to review and verify compliance of the Design/Build Entity's quality control and assurance teams with the contract documents.

If any work is covered without the required testing or witnessed by the City, then such work shall be uncovered at the Design/Build Entity's expense. Whenever the Design/Build Entity intends to perform work on Saturday, Sunday, or a legal holiday, the Design/Build Entity shall give written notice to the City of such intention at least 48 hours prior to performing the work, so that the City may make necessary arrangements.

- 3.22.2 If the City determines portions of the Work require additional testing or inspection that is not included in the Contract Documents, then the City will instruct the Design/Build Entity, in writing, to make arrangements for additional testing or inspection by an entity acceptable to the City, and the Design/Build Entity shall give 48 hours written notice to the City of where and when tests and inspections will be conducted so that the City may observe the procedures. The City will bear the costs except as provided in Subparagraph 3.22.1.
- 3.22.3 If procedures for testing, inspection or approval under Subparagraphs 3.22.1, 3.22.2 and 3.22.3 reveal failure of a portion(s) of the work to comply with the Contract Documents, the Design/Build Entity shall bear all costs and time made necessary by such failure(s) including those of repeated procedures and compensation for the City's services and expenses. The Design/Build Entity shall notify the City in writing within 24 hours of any test conducted by the independent testing agency reveals work failing to comply with the contract documents.
- 3.22.4 Required certificates of testing and inspection shall, unless otherwise required by the Contract Documents, be secured by the Design/Build Entity and delivered to the City within seven days after each test.
- 3.22.5 Provide qualified on-site personnel to review and record daily construction activities, including subcontract activities, to determine adequacy of work and compliance with the approved plans and

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

specifications. Provide written daily reports in a daily report format approved by the City, including, but not limited to: project title, date of work, contract day, weather and conditions (temperature, wind, humidity, etc.), a description of the work in progress by corresponding schedule activity number(s), name of each subcontractor on site and work being performed, location of each trade on the project site, total daily man count per trade (including the Design/Build Entity's work force), material deliveries and quantities, equipment deliveries, potential delays and delays encountered, orders of instruction, unsatisfactory work, tests performed, safety concerns, visitors, and any other issues to document work performed and areas of concern. Daily reports shall be signed by the Design/Build Entity's Quality Assurance Manager and Project Manager and submitted to the City's Construction Manager through the City's Procure system no later than the 12:00 p.m. following the day work was performed. The Design/Build Entity shall separately provide written reports to the City's Construction Project of any noted deficiencies in the installed work and corrective measures taken, and test reports of work being installed.

### **3.23 Air Pollution.**

3.23.1 The Design/Build Entity and each subcontractor shall comply with all State, City and or local air pollution control rules, regulations, ordinances, and statutes that apply to any work performed under the Agreement. If there is a conflict between the State, City and local air pollution control rules, regulations, ordinances and statutes, the most stringent shall govern.

### **3.24 Certification by Design/Build Entity of Recycled Content.**

3.24.1 The Design/Build Entity shall certify in writing, under penalty of perjury, to the City awarding an agreement under this part, the minimum, if not exact, percentage of recycled content, both post-consumer material and secondary material, as defined in Public Contract Code Sections 12161 and 12200-12226, in materials, goods, or supplies offered or products used in the performance of the Agreement, regardless of whether the product meets the required recycled percentage as defined in Sections 12161 and 12200-12226. The Design/Build Entity may certify that the product contains zero recycled content. This information shall be provided for all materials with recycled content noted in the Contract Documents. See also Management Plan Information and Requirements, and Waste Management Plan.

### **3.25 Unfair Business Practices.**

The Design/Build Entity agrees, and will require all of the Design/Build Entity's contractors and subcontractors and suppliers to agree, to assign to the awarding body all rights, title, and interest in and to all causes of action they may have under Section 4 of the Clayton Act (15 U.S.C. Section 15), or under the Cartwright Act (commencing with Section 16700 of the Business

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

and Professions Code), arising from the purchase of goods, services or materials, pursuant to the Contract Documents or any subcontract there under. An assignment made by the Design/Build Entity, and all additional assignments made by subcontractors and suppliers, shall be deemed to have been made and will become effective at the time the City tenders Final Payment to the Design/Build Entity, without further acknowledgment of the parties.

## ARTICLE 4 – CITY’S DUTIES AND RESPONSIBILITIES

### 4.1 City’s Representative.

- 4.1.1 The City shall designate, from time to time, one or more representatives authorized to act on the City’s behalf with respect to the Project, together with the scope of his/her respective authority. Functions for which this Design/Build Agreement provides to be performed by the City may be delegated by the City only by written notice to the Design/Build Entity from the City.

The Design/Build Entity shall not be entitled to rely on directions (nor shall it be required to follow the directions) from anyone outside the scope of that person’s authority as set forth in written authorization pursuant to this Design/Build Agreement. Directions and decisions made by Authorized Representatives of the City shall be binding on the City.

### 4.2 Communication with the Design/Build Entity.

- 4.2.1 During the term of this Design/Build Agreement, the City shall communicate with the Design/Build Entity, subcontractors, suppliers, and others performing any part of the Work only through the Design/Build Entity’s Authorized Representatives, as may be amended, subject to any approvals required by the City as described in the Contract Documents.

### 4.3 City’s Consent.

- 4.3.1 Whenever the City’s consent, review, satisfaction, or determination shall be required or permitted under the Contract Documents with respect to the Design/Build Entity’s performance of the Work, and this Design/Build Agreement does not expressly state that the City may act in its sole discretion, such consent, review, satisfaction or determination shall not be unreasonably withheld.

The City shall cooperate fully with the Design/Build Entity and shall furnish decisions, information, and/or reviews required by this Design/Build Agreement in a timely manner so as not to delay the Work, provided that the City shall have no less time for review than set forth in the Project Baseline Schedule as developed by the Design/Build Entity and accepted by the City.

### 4.4 City Review of Design Materials.

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

- 4.4.1 The Design/Build Entity shall be entitled to proceed with all or a part of the construction phase of the Project upon the City's review and approval of the design and construction documents, and any subsequent submittals or shop drawings for conformance with the Design Requirements, and other Contract Documents. If the City modifies or otherwise changes in a material way the Scope of Work called for in the construction documents, subsequent submittals or shop drawings, after such review for conformity, the Design/Build Entity shall be entitled to a Change Order in accordance with Article 8, Changes in the Work, of the Agreement. In no event shall a Change Order be issued to the extent such modification is due to the fault or neglect of the Design/Build Entity, or in the event the original submittals were not accompanied by annotations showing nonconformance with the Contract Documents, if any.

### **ARTICLE 5 – SUBCONTRACTING AND LABOR**

#### **5.1 Subletting and Subcontracting.**

- 5.1.1 The Design/Build Entity shall adhere to the rules governing subcontracting as set forth in the Subletting and Subcontracting Fair Practices Act, commencing with Public Contract Code, Section 4100. Subcontractor substitutions shall be in accordance with the Act and any violations may subject the Design/Build Entity to penalties and disciplinary action as provided by the Subletting and Subcontracting Fair Practices Act.
- 5.1.2 The Design/Build Entity shall be responsible for all work performed under this Agreement. All persons engaged in the Project will be considered employees of the Design/Build Entity. The Design/Build Entity shall give personal attention to fulfillment of the Agreement and shall keep the Work under the Design/Build Entity's control. When any subcontractor fails to execute a portion of the work in a manner satisfactory to the City, the Design/Build Entity shall remove such subcontractor immediately upon written request notice from the City, and the subcontractor shall not again be employed on the Project. Although Specification Sections, Part 4 of the Contract Documents, may be arranged according to various trades or general grouping of work, the Design/Build Entity is not obligated to sublet work in such manner. The City will not entertain requests to arbitrate disputes among subcontractors or between the Design/Build Entity and subcontractor(s) concerning responsibility for performing any part of the Work.
- 5.1.3 The City may not permit a subcontractor who is ineligible to bid or work on, or be awarded, a public works project pursuant to Sections 1777.1 or 1777.7 of the Labor Code.

Any contract on a public works project entered into between a Design/Build Entity and a debarred subcontractor is void as a matter of law. A debarred subcontractor may not receive any public money for performing work as a subcontractor on a public works contract, and any public money that may have been paid to a debarred

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

subcontractor by the Design/Build Entity on the project shall be returned to the awarding body by the Design/Build Entity. The Design/Build Entity shall be responsible for the payment of wages to workers of a debarred subcontractor who has been allowed to work on the project.

### 5.2 Subcontracting Relations.

The Design/Build Entity shall, by subcontractor agreement, require each subcontractor, to the extent of the work to be performed by the subcontractor, to be bound to the Design/Build Entity by terms of the Contract Documents, and to assume toward the Design/Build Entity all the obligations and responsibilities which the Design/Build Entity, by the Contract Documents, assumes toward the City. Each subcontractor agreement shall preserve and protect the rights of the City under the Contract Documents with respect to the work to be performed by the subcontractor.

The subcontractor shall be allowed, unless specifically provided otherwise in the subcontractor agreement, the benefits of all rights, remedies and redress against the Design/Build Entity that the Design/Build Entity, by the Contract Documents, has against the City. The Design/Build Entity shall require each subcontractor to enter into similar agreements with sub-subcontractors. The Design/Build Entity shall make available to each proposed subcontractor, prior to the execution of the subcontractor agreement, copies of those portions of the Contract Documents to which the subcontractor will be bound. Subcontractors shall similarly make copies of applicable portions of such documents available to their respective proposed sub-subcontractors.

### 5.3 Subcontractor Progress Payments.

Within 10 days of receipt of each progress payment, the Design/Build Entity shall make payment to subcontractors in accordance with Public Contract Code Section 10262.

### 5.4 Contract Assignments.

Performance of the Contract Documents may not be assigned except upon written consent of the City. Consent will not be given to an assignment that would relieve the Design/Build Entity or the Design/Build Entity's surety of their responsibilities under the Contract Documents.

### 5.5 **[Intentionally left blank]**

### 5.6 **[Intentionally left blank]**

### 5.7 Statement Of Compliance.

The Design/Build Entity's execution of this Agreement shall constitute a certification under penalty of perjury under the laws of the State of California that the Design/Build Entity will, unless exempted, comply with the nondiscrimination program requirements of Government Code section 12990

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

and 2 CCR, section 8103.

### 5.8 Drug-Free Workplace Certification.

By signing this Agreement, the Design/Build Entity certifies under penalty of perjury under the laws of the State of California that the Design/Build Entity will comply with the requirements of the Drug-Free Workplace Act of 1990 (Government Code section 8350 et seq.).

### 5.9 Nondiscrimination.

5.9.1 Equal Employment Opportunity. Design/Build Entity agrees for the duration of this Contract it will not discriminate against any employee or applicant for employment because of age, ancestry, color, gender, marital status, medical condition, national origin, physical or mental disability, race, religion, sexual orientation or other protected status. The Design/Build Entity will take affirmative action to insure employees are treated during employment or training without regard to their race, color, religion, sex, national origin, age, political affiliation, marital status, or disability. The Design/Build Entity agrees to post in conspicuous places, available to employees and applicants for employment, notices to be provided setting forth the provisions of the Nondiscrimination Clause.

- a. The Design/Build Entity will in all solicitations or advertisements for employees placed by or on behalf of the Design/Build Entity, state that all qualified applicants will receive consideration for employment without regard to age, ancestry, color, gender, marital status, medical condition, national origin, physical or mental disability, race, religion or sexual orientation.
- b. The Design/Build Entity will send to each labor union or other representative of workers with which it has a collective bargaining agreement or other contract or understanding, a notice advising the workers' representative of the Design/Build Entity commitments under this Agreement. The Design/Build Entity agrees that it will comply with the provisions of Titles VI and VII of the Civil Rights Act, Revenue Sharing Act Title 31, U.S. Code Section 2716 and California Government Code Section 12990.
- c. The Design/Build Entity agrees it will assist and cooperate with the City, the State of California and the United States Government in obtaining compliance with the Equal Opportunity Clause, rules, regulations and relevant orders of the State of California and United States Government issued pursuant to the above-referenced Acts.
- d. In the event of the Design/Build Entity's non-compliance with the Nondiscrimination Clause or with any of the said rules, regulations or orders, this Contract may be canceled, terminated, or suspended in whole or in part by the City.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- 5.9.2 Disabled Non-Discrimination. This project is subject to Section 504 of the Rehabilitation Act of 1973 as amended, (29 U.S.C. 794), the Americans with Disabilities Act of 1990 and all requirements imposed by the guidelines and interpretations issued in furtherance of the ADA. In this regard, the City, its Design/Build Entity's and subcontractors will take all reasonable steps to ensure that disabled individuals have the maximum opportunity for the same level of aid, benefit or service as any other individual.
- 5.9.3 Fair Employment and Housing Act Addendum. In the performance of this Agreement, the Design/Build Entity will not discriminate against any employee or applicant for employment because of age, ancestry, color, gender, marital status, medical condition, national origin, physical or mental disability, race, religion or sexual orientation. The Design/Build Entity will take affirmative action to ensure that applicants are employed and that employees are treated during employment, without regard to their age, ancestry, color, gender, marital status, medical condition, national origin, physical or mental disability, race, religion or sexual orientation. Such action shall include, but not be limited to, the following: employment, upgrading, promotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation and selection for training, including apprenticeship. The Design/Build Entity shall post in conspicuous places, available to employees and applicants for employment, notices to be provided by the State or local agency setting forth the provisions of this Fair Employment and Housing Section.
- a. The Design/Build Entity will permit access to his records of employment, employment advertisements, application forms and other pertinent data and records by the California Fair Employment and Housing Commission, or any other agency of the State of California designated by the awarding authority, for the purposes of investigation to ascertain compliance with the Fair Employment and Housing section of this Contract.
  - b. The State, County, or City may determine a willful violation of the Fair Employment and Housing provision to have occurred upon receipt of a final judgment having that effect from a court in an action to which Design/Build Entity was a party, or upon receipt of a written notice from the Fair Employment and Housing Commission that it has investigated and determined that the Design/Build Entity has violated the Fair Employment and Housing Act and has issued an order or obtained an injunction under Government Code Sections 12900, *et seq.*
  - c. For willful violation of this Fair Employment and Housing provision, the City may terminate this Contract either in whole or in part and any loss or damage sustained by the City in securing replacement goods or services shall be borne and paid for by the Design/Build Entity and by his surety under the Performance Bond, and/or the City may deduct from any moneys due or that may become due to the

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

Design/Build Entity to compensate the City, the difference between the price named in the Agreement and the actual cost to the City.

### 5.10 Wages and Records.

#### 5.10.1 Wage Rates

- a. Pursuant to Section 1770 and 1773 *et seq.* of the Labor Code of the State of California, the Director of Industrial Relations (DIR) has ascertained the general prevailing rate of per diem wages and the rates for overtime and holiday work in the locality in which the work is to be performed for each craft, classification, or type of workman needed to execute the Agreement, copies of which are on file and available upon request from the California Department of Industrial Relations.
- b. The Design/Build Entity and any subcontractor under him, must not pay less than prevailing wage rates to all laborers, workmen and mechanics employed in the execution of the Contract. Such wages shall be in accordance with the higher of those required by the DIR or Davis Bacon rules and regulations. It is further expressly stipulated that the Design/Build Entity shall, as a penalty to City, forfeit twenty-five dollars (\$25.00) for each calendar day, or portion thereof, for each laborer, workman, or mechanic paid less than the stipulated prevailing rates for any work done under this Agreement by him or by any subcontractor under him and Design/Build Entity agrees to comply with all provisions of Section 1770 *et seq.* of the Labor Code.
- c. In case it becomes necessary for the Design/Build Entity or any subcontractor to employ on the Project under this Agreement any person in a trade or occupation (except executives, supervisory, administrative, clerical, or other non-manual workers as such) for which no minimum wage rate is specified, the Design/Build Entity shall immediately notify the City who will promptly determine the prevailing rate for such additional trade or occupation and shall furnish the Design/Build Entity with the minimum rate. The minimum rate furnished shall be applicable as a minimum for such trade or occupation from the time of the initial employment of the person affected and during the continuance of such employment.
- d. Pursuant to Sections 1770 and 1773 of the Labor Code, the general prevailing rate of per diem wages applicable to the work to be done for straight time, overtime, Saturday, Sunday and holiday work are set forth by the Director of the California Department of Industrial Relations and are a part of the Agreement. The Design/Build Entity is required to post a copy of these prevailing wages rates on the job site.
- e. The City will not recognize any claim for additional compensation because of the payment by the Design/Build Entity of any wage rate in excess of the prevailing wage rate set forth as provided herein. The possibility of wage increases is one of the elements to be

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

considered by the Design/Build Entity in submitting its Design/Build Proposal and will not under any circumstances be considered as the basis of a claim against the City on the Contract.

### 5.10.2 Wage Records

- a. The Design/Build Entity and each subcontractor shall keep or cause to be kept an accurate record (certified payroll) showing the names and occupations of all laborers, workers and mechanics employed by him in connection with the execution of this Contract or any subcontract thereunder and showing also the actual per diem wages paid to each of said workers, which records shall be provided to the City and to the California Department of Industrial Relations upon its request. Copies provided will include one, which has the name and social security numbers marked out.
- b. The Design/Build Entity shall meet the requirements of Section 7-1.01A(3). "Payroll Records," of the State of California Standard Specifications. The Design/Build Entity shall be responsible for compliance by his subcontractors.
- c. Certified Payroll records shall be submitted with each Monthly Progress Payment request showing records within 10 days after the billing period. The Design/Build Entity shall provide all information reasonably required by Labor Trade organizations.

## **ARTICLE 6 – PAYMENTS AND COMPLETION**

### 6.1 Cost Plus with Guaranteed Not To Exceed Amount.

In consideration of Design/Build Entity's obligations under the Contract Documents, Design/Build Entity will be paid the Cost Plus with Guaranteed Not To Exceed Amount, in accordance with the payment procedures set forth herein. Except as otherwise provided in the Contract Documents, the Cost Plus with Guaranteed Not To Exceed Amount will fully compensate Design/Build Entity for all of the services required under the Contract Documents, including the scope of services described in this Agreement.

### 6.2 Schedule of Values.

6.2.1 Within 30 days after the Effective Date and prior to the first Application for Payment, the Design/Build Entity shall submit to the City a Schedule of Values to complete the Project, supported by such data to substantiate the accuracy as the City may require. The Schedule of Values, unless objected to by the City within 15 days after receipt, shall be used as a basis for progress payments.

6.2.2 This Schedule of Values may be adjusted from time-to-time as the subcontracting plan is finalized.

### 6.3 Application for Payment.

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

The Design/Build Entity shall deliver to the City on the last business day of each month, or as otherwise agreed by both parties, an Application for Payment, in the format approved by the City, covering that portion of the Cost Plus with Guaranteed Not To Exceed Amount allocated to the Work completed during each month and in accordance with the Schedule of Values. Invoices shall include the contract number, the project number, the amendment number, Design/Build Entity's Federal Employer Identification Number (FEIN); and shall be submitted to the City, attention of the Project Director in care of the City's Construction Manager.

Application for payment shall not be submitted more frequently than once monthly. The application for payment shall be signed by an officer or designee of the Design/Build Entity's firm. Provided the Application for Payment is received and approved by the City, the City shall make payment to the Design/Build Entity not later than 30 days after receipt by the City of the approved payment application. With each Application for Payment, the Design/Build Entity shall submit such evidence as may be necessary to demonstrate costs incurred or estimated to be incurred in accordance with the Schedule of Values during such month and the percentage of completion of each category of Work and the applicable Cost Plus amounts.

### **WAIVER AND RELEASE FORMS**

Consistent with the provisions of California Civil Code sections 8122 and 8124, the Design/Build Entity and its subcontractors shall promptly furnish the City with a release of all claims against the City arising by virtue of the Contract Documents related to amounts to be paid or which have been paid. This section shall survive expiration or termination of the Contract. The Design/Build Entity shall include these requirements in all subcontracts for this project. The Design/Build Entity and subcontractors from the operation of the release may specifically exclude disputed contract claims in stated amounts.

Neither the City nor the Design/Build Entity by any term of this Contract, or otherwise, shall waive, affect, or impair the claims and liens of other persons whether with or without notice except by their written consent, and any term of the Contract to that effect shall be null and void. Any written consent given by any claimant pursuant to this section shall be null, void, and unenforceable unless and until the claimant executes and delivers a waiver and release. Such a waiver and release shall be binding and effective to release the City, construction lender, and surety on a payment bond from claims and liens only if the waiver and release follows substantially one of the forms set forth in California Civil Code section 8132 and this section and is signed by the claimant or his/her authorized agent, and, in the case of a conditional release, there is evidence of payment to the claimant. Evidence of payment may be by the claimant's endorsement on a single or joint payee check that has been paid by the bank upon which it was drawn or by written acknowledgment of payment given by the claimant.

No oral or written statement purporting to waive, release, impair or otherwise adversely affect a claim is enforceable or creates any estoppel or impairment of a claim unless:

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

- (1) It is pursuant to a waiver and release prescribed herein, or
- (2) The claimant had actually received payment in full for the claim.

This section does not affect the enforceability of either an accord and satisfaction regarding a bona fide dispute or any agreement made in settlement of an action pending in any court provided the accord and satisfaction or agreement and settlement make specific reference to the stop notice or bond claims.

The waiver and release given by any claimant hereunder shall be null, void, and unenforceable unless it follows substantially the forms as presented in California Civil Code section 8122.

## 6.4 Progress Payments.

The City shall pay the Design/Build Entity the progress payments through the period covered by the Application for Payment, less five percent retention. Upon receipt of an Application for Payment from the Design/Build Entity, the City will promptly review the same to determine if it is a proper Application for Payment based on the approved Schedule of Values. Any Application for Payment determined by the City not to be suitable for payment shall be modified and processed per the City's assessment. The reason(s) the Application for Payment was deemed unsuitable shall be stated in writing.

## 6.5 Withholding of Payment.

6.5.1 Notwithstanding the provisions of Subparagraph 6.11.6, Final Payment, the City may withhold payment on account of an Application for Payment to the extent necessary to protect the City from loss because of:

- .1 Defective Work not remedied;
- .2 Third-party claims filed or reasonable evidence indicating probable filing of such claims;
- .3 Failure of the Design/Build Entity to make payments of undisputed amounts to Design/Build team consultants or subcontractors for labor, materials, or equipment;
- .4 Damage to the City caused by the fault or neglect of the Design/Build Entity to the extent not covered by insurance; or
- .5 Reasonable evidence that the Work will not be substantially completed within the Contract Time due to delay not considered a Compensable Event, and that the unpaid balance of the Cost Plus with Guaranteed Not To Exceed Amount would not be adequate to cover liquidated damages for the anticipated inexcusable delay.

6.5.2 When the above reasons for withholding payment are removed,

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

payment less retention shall be made for amounts previously withheld. Prior to any withholding pursuant to this paragraph, the City shall meet with the Design/Build Entity to discuss potential withholding, and shall attempt in good faith to resolve such issue without the need for withholding. Amounts withheld shall bear interest at whatever rate is paid to the City from time to time for funds it may have on deposit, from the date the funds would otherwise have been due until paid, if at all. In lieu of withholding the Design/Build Entity may deposit securities equivalent to the amount withheld in accordance with the procedures outlined in Article 6.10.1.1

### **6.6 Payment for Stored Materials.**

Unless otherwise provided in the Contract Documents, payment will be made on account for materials or equipment not incorporated in the Work but delivered and suitably stored at the Site and/or if approved in advance by the City, payments may be made for materials or equipment stored at some other location agreed upon in writing. Payments made for materials or equipment stored on or off-site shall be conditioned upon submission by the Design/Build Entity of bills of sale or such other procedures satisfactory to the City to establish City's title to such materials or equipment or otherwise protect the City's interest, including applicable insurance and transportation to the Site for those materials and equipment stored off-site.

### **6.7 Payments as Trust Funds.**

Any and all funds payable to the Design/Build Entity are hereby declared to constitute trust funds in the hands of the Design/Build Entity to be applied first to payment of claims of subcontractors, sub-subcontractors, architects, engineers, surveyors, laborers, material men or employees arising out of the described Work, to obligations for utilities furnished, tax imposed or such to the payment of premiums on security or other bonds, and to payment of insurance premiums relating to the Project and to payments and contributions to union pension plans and trust funds before application to any other purpose.

### **6.8 Payment Not a Waiver.**

6.8.1 No payment hereunder, including Final Payment to Design/Build Entity, nor City's use or Beneficial Occupancy of the Work, shall release Design/Build Entity with respect to design, construction, workmanship, materials, equipment or machinery incorporated in the Work which are found to be defective, unsound or improper.

6.8.2 No payment made under the Design/Build Agreement, shall be evidence of performance thereof, either wholly or in part, nor shall it be construed to be acceptance of defective work or improper material, or an approval of any items in any application for payment.

### **6.9 Waiver of Lien and Payment Bond Rights.**

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

The Design/Build Entity shall attach to each application for payment, a waiver of all lien and payment bond rights, with respect to all amounts requisitioned up to and including the then current requisition from the Design/Build Entity, which waiver of lien and payment bond rights covers all amounts requisitioned from the Design/Build Entity's subcontractors and all tiers and suppliers. Upon request, Design/Build Entity shall make available copies of similar waivers from its subcontractors of all tiers and suppliers.

### 6.10 Retentions.

The City will retain five percent of such estimated value of all Work completed (including design and other professional services) and a like percentage within limits established by law, of the value of materials so estimated to have been furnished, delivered and unused, as aforesaid, as part of security for fulfillment of the Contract Documents by the Design/Build Entity. At any time after 95% of the Work has been completed, the City may reduce funds withheld to an amount not less than one hundred 125% of the estimated value of the Work yet to be completed, as determined solely by the City. The completion of the design work will be evaluated separate from the construction effort, and redirection of retainage will be evaluated accordingly. The City will pay monthly to the Design/Build Entity while executing the Work the balance not retained after deducting all previous payments and all sums to be retained under provisions of the Contract Documents.

Investment Options:

- 6.10.1 At the request and expense of the Design/Build Entity, and in accordance with Public Contract Code Section 10263, securities equivalent to the amount withheld shall be deposited with the City Treasurer or, a state or federally chartered bank in California, as the escrow agent, who shall then pay the moneys to the Design/Build Entity. Upon satisfactory completion of the Agreement, the securities shall be returned to the Design/Build Entity.
- 6.10.2 Alternatively, the Design/Build Entity may request and the City will make payment of the retention earned directly to the escrow agent. The Design/Build Entity may direct the investment of the payments into securities and the Design/Build Entity shall receive the interest earned on the investments upon the same terms provided for securities deposited by the Design/Build Entity. Upon satisfactory completion of the Work, the Design/Build Entity shall receive from the escrow agent all securities, interest, and payments received by the escrow agent from the City, pursuant to the terms of Final Payment.
- 6.10.3 Securities eligible for investment shall include those listed in Government Code Section 16430; bank or savings and loan certificates of deposit; interest-bearing demand deposit accounts; standby letters of credit; or any other securities mutually agreed to by the Design/Build Entity and the City.

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

- 6.10.4 The Design/Build Entity shall be beneficial owner of any securities substituted for moneys withheld and shall receive any interest thereon.
- 6.10.5 The escrow agreement shall be substantially similar to the form "Escrow Agreement for Security Deposits in Lieu of Retention" found in Public Contract Code Section 10263.
- 6.11 Payment and Completion.
- 6.11.1 The City reserves the right to occupy all or any part of the Project prior to completion of the Work, upon written notice. In this event, the Design/Build Entity shall be relieved of responsibility to the City for injury or damage that results from occupancy and use by the City. If, by reason of the City's occupancy, the premium for the Design/Build Entity's bodily injury and property damage insurance is increased, the City will reimburse the Design/Build Entity for the additional amount necessarily incurred allocable to the area and the period of City's occupancy up to the date of Final Completion.
- 6.11.2 The City's occupancy does not constitute acceptance by the City of the Work, or any portion of the Work, nor will it relieve the Design/Build Entity of responsibility for correcting defective Work or materials found at any time before Final Completion, as set forth in Paragraph 3.18, Guarantee, or during the guarantee period after the City's acceptance, as set forth in Subparagraph 6.11.6, Final Payment. However, when the Project includes separate buildings, and one or more of the buildings is entirely occupied by the City, then upon written request by the Design/Build Entity and by written consent from the City, the guarantee period will commence to run for a building or buildings from the date of the City's Beneficial Occupancy of a building or buildings.
- 6.11.3 Beneficial Occupancy. The City may occupy or use any completed or partially completed portion of the Work at any stage when such portion is designated by separate agreement with the Design/Build Entity, provided such occupancy or use is consented to by the insurer of the Project and the City, Notice of Substantial Completion, and a Temporary Certificate of Occupancy is obtained.

Such partial occupancy or use may commence whether or not the portion is complete, provided the City and the Design/Build Entity have accepted in writing the responsibilities assigned to each of them for payment, security, maintenance, heat, utilities, damage to the Work and insurance, and have agreed in writing concerning the period for correction of the Work and commencement of warranties required by the Contract Documents. Immediately prior to such occupancy, the City and the Design/Build Entity shall jointly inspect the area to be occupied in order to determine and record the condition of the Work. Unless otherwise agreed, partial occupancy or use of a portion of the Work shall not constitute acceptance of Work not complying with the requirements of the Contract Documents.

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

- 6.11.4 Substantial Completion: When the Work, or designated portion thereof, is sufficiently complete in accordance with the construction documents so that it can be used for its intended purpose, the Design/Build Entity and the City shall collaboratively prepare a single comprehensive punch list. The Design/Build Entity shall then proceed promptly to complete and correct the punch list items. Failure to include an item on the punch list does not alter the responsibility of the Design/Build Entity to complete all work in accordance with the Contract Documents.
- 6.11.5 Final Completion: Upon completion of the punch list the City will make an inspection to determine whether the work has been completed. The Certificate of Final Completion shall be issued when all work is complete, and the Council has formally accepted the project.
- 6.11.6 Waiver of Claims. Acceptance of Final Payment by the Design/Build Entity shall constitute a waiver of affirmative claims by the Design/Build Entity, except those previously made in writing and identified as unsettled at the time of Final Payment.
- 6.11.7 Final Payment. Upon execution of the Certificate of Final Completion, providing no stop notices have been filed which have not been discharged or bonded, all amounts unpaid under the Design/Build Agreement will be paid to Design/Build Entity. The City may withhold any reasonable sums payable to Design/Build Entity for the value of any Work, which the City may have found defective and ordered to be replaced. Final Payment for withholdings will be made when the Work is completed and/or defective Work replaced.
- City shall pay the remaining amount of the Cost Plus with Guaranteed Not To Exceed Amount due to the Design/Build Entity, after:
- .1 Acceptance and Close-out of the Work.
  - .2 Resolution of all stop notices.
  - .3 Execution by the Design/Build Entity of a release of all claims against the City arising by virtue of the Design/Build Agreement.
  - .4 Any other requirements spelled out in the Design/Build Agreement.
- 6.11.8 The Design/Build Entity is required to pay subcontractors from whom a retention has been withheld within seven days of receipt from the City of retention proceeds.
- 6.11.9 The making of Final Payment by the City shall constitute a waiver of claims by the City, except those arising from (a) liens, claims, security interests and encumbrances arising out of the Work after Final Payment, or identified in writing as unsettled at the time of Final

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

Payment; (b) latent defects arising after Final Payment; (c) the terms of warranties required by the Contract Documents; or (d) indemnities which shall survive completion of the Design/Build Agreement.

### 6.12 Interest.

Payments due and unpaid under this Agreement shall bear interest pursuant to Public Contract Code Section 10261.5 (relating to progress payments) and Section 7107 (relating to retentions).

### 6.13 Shared Cost Savings

Any potential modifications to the project work identified by the Design-Build Entity after the execution of this document shall be submitted for approval by the City's authorized representative. If approved and validated, then any actual cost savings realized by the City may be will be shared with the Design/Build Entity. The amount to be shared with the Design-Build Entity shall be 50% of the final realized cost savings based on those modifications and on any deletions to the Project made by the City..

### 6.14 Allowance for Environmental Requirements

6.14.1 The Cost Plus with Guaranteed Not To Exceed Amount described in section 3.2.1 includes \_\_\_\_\_ Dollars (\$\_\_\_\_\_) for the execution of requirements neither specified nor anticipated in the Anticipated Environmental Impact Report Mitigation Measures (EIRMM). That amount will be utilized by the Design/Build Entity on a time and materials basis for EIRMM work resulting directly from requirements not specified in the EIRMM that could arise during the EIR process and that will add cost to the project. This allowance item is only to be utilized for unanticipated work associated with the EIRMM.

6.14.2 The Design-Build Entity and the City have worked together to review the Allowance Item and Values based on available EIRMM information to determine the Allowance Values constitute reasonable estimates for the unanticipated EIRMM work. The Design-Build Entity and City will continue working closely together during the preparation of the design to develop Construction Documents consistent with these EIRMM Allowance Values. Nothing herein is intended in any way to constitute a guarantee by Design-Build Entity the EIRMM Allowance Item in question can be performed for the Allowance Value.

6.14.3 No work shall be performed on any EIRMM Allowance Item without Design/Build Entity first obtaining in writing advanced authorization to proceed from the City. The City agrees if the Design/Build Entity is not provided written authorization to proceed on an EIRMM Allowance Item by the date set forth in the Project schedule, due to no fault of Design/Build Entity, Design-Builder Entity may be entitled to an adjustment of the Contract Time(s) and the Cost Plus with Guaranteed Not To Exceed Amount.

6.14.4 The Allowance Value for an EIRMM Allowance Item includes the direct cost of labor, materials, equipment, transportation, taxes and insurance associated with the applicable Allowance Item. All other costs, including

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

design fees, the Design/Build Entity's overall project management and general conditions costs, overhead and fee, are deemed to be included in the original Contract Price, and are not subject to adjustment, regardless of the actual amount of the EIRMM Allowance Item.

### **6.15 [Intentionally left blank]**

### **6.16 Compensable Cost Escalation**

6.15.1 After the award of this Design-Build Agreement, the Notice to Proceed (NTP) for construction is anticipated to be delayed for up to eight months. The Design-Build Entity will not be compensated for increases in pricing within that delay unless the Engineering News-Record (ENR) Construction Cost Index (CCI) exceeds 3.0% annual average for eight months. If the NTP for construction is not issued within eight months, then the Cost Plus with Guaranteed Not To Exceed Amount will be increased by the amount as documented by the Engineering News-Record Construction Cost Index. Any increase, if any at all,, in the amount of the Cost Plus with Guaranteed Not To Exceed Amount that would be adjusted because of the delayed issuance of the NTP is to be equal to the increase in the ENR CCI in excess of 3.0% annual average over the first eight months and equal to the increase in the ENR for any additional delay in the issuance of the NTP.

## **ARTICLE 7 – SCHEDULE**

### **7.1 Contract Time.**

The "Contract Time" – is the period from receipt by Design/Build Entity of written authorization to begin the Project in the form of a Notice to Proceed from the City, until the scheduled date of Final Completion of the Work. The Design/Build Entity agrees to design, construct and manage the Work in accordance with the Project Milestone Schedule and approved Baseline Schedule.

### **7.2 Completion.**

By executing this Design/Build Agreement, the Design/Build Entity confirms that the Contract Time and Milestones, as stated in the Project Milestone Schedule (Exhibit A) of the Contract Documents, are of the essence of this Design/Build Agreement. The Design/Build Entity confirms that the Contract Time and Milestones allow a reasonable period of time for achieving the Temporary and Final Certificates of Occupancy and Certificate(s) of Final Completion of the Work for the Project.

### **7.3 Schedules.**

7.3.1 The Design/Build Entity shall be responsible for the development and

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

maintenance of the Preliminary Baseline Schedule, the Baseline Schedule, the Progress Schedule and the Short-Term Schedule as described below. The Design/Build Entity shall submit, as indicated below, each schedule for the execution of the Work for the City's review and response. The City's review of and response to the schedule submissions shall not be construed as relieving the Design/Build Entity of its complete and exclusive control over the means, methods, sequences and techniques for executing the Work. Each schedule shall provide an interrelated means for defining activities involved in the planning, design, construction, and completion of the Project, their sequences and elapsed completion time from the date of the Notice to Proceed.

Each schedule shall utilize CPM (Critical Path Method) and shall be submitted in diagram and listed form. The computerized schedules shall permit the Design/Build Entity to obtain several print sorts that aid in identifying various activities and requirements. Of particular importance would be critical activities that require information or reviews by City, City agencies, or the Construction Manager. The Design/Build Entity shall utilize Primavera (P3) or Microsoft Project software (latest version).

The Design/Build Entity shall make its Authorized Schedule Representative available throughout the contract time and authorize that person to make scheduling commitments binding on the Design/Build Entity, as required to fulfill the scheduling requirements. The Design/Build Entity has submitted a preliminary schedule of the work (the "Proposal Schedule") in bar chart form with its proposal, incorporating all critical path milestones identified by the City or known milestones and critical activities by the Design/Build Entity, as well as the date for contract completion.

Design/Build Entity's representation that it could comply with the contract milestones, as demonstrated by its Proposal Schedule was an element of consideration in the City's award of the contract. Design/Build Entity's Proposal Schedule, as submitted with its proposal and as modified during negotiations and accepted by the City, will be utilized as an interim contract schedule for all purposes until the Design/Build Entity's submittal of an acceptable Preliminary Baseline Schedule.

7.3.2 Design/Build Entity's Preliminary Baseline Schedule. Within 14 calendar days after the Notice to Proceed, the Design/Build Entity shall submit a Preliminary Baseline Schedule to the Construction Manager. This schedule shall show, but is not limited to, the general plan for the work to be completed in the first 90 calendar days after the Effective Date, as defined below. The Preliminary Baseline Schedule shall contain, but not be limited to:

- .1 dates established in the City's Project Milestone Schedule;
- .2 dates to acquire, set up and occupy a field office if required;

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- .3 dates of all mobilization activities on site, including notices and permits;
- .4 dates detailing the planned design schedule, including submittals and reviews;
- .5 anticipated dates for the start and completion of each stage of the design and construction process; and
- .6 established milestone dates representing important events in the first 90 days and 'major milestones' representing the completion of a group of activities in the first year.

The Preliminary Baseline Schedule shall be in the form of a CPM schedule. Design/Build Entity will provide all data files electronically on compact disc. The City and Construction Manager will review the Design/Build Entity's Preliminary Baseline Schedule for conformance with the Milestone Schedule and interrelationships with other activities requiring coordination that may be outside the scope of this agreement. Upon completion of the review, the City may make recommendations to the Design/Build Entity as to adjustments to the Preliminary Baseline Schedule. These recommendations, if accepted by both the City and Design/Build Entity, will be incorporated into the development of the Design/Build Entity's Baseline Schedule.

7.3.3 Design/Build Baseline Schedule. Within 60 calendar days after the Notice to Proceed, the Design/Build Entity, after an initial meeting with the City, shall prepare a proposed Baseline Schedule for the Project. Recognizing that planning activities and design activities need time control to no less degree than construction activities, this schedule shall include, but not be limited to:

- .1 A CPM format that incorporates all activities with descriptions, sequence, logic relationships, duration estimates, resource-loading, cost loading and other information required for all design, pre-construction and construction activities. Each activity shall have a minimum of one predecessor and one successor, with the exception of the first and last activities. The first activity will be denoted as "Notice To Proceed" and the last activity will be denoted as "Final Completion". Both activities shall be contract milestones.
- .2 The CPM format shall include all Contract Milestones defined in this Agreement and/or by the Design/Build Entity's proposed preliminary schedule, as well as all engineering, fabrication and delivery dates required to support the milestones.
- .3 Activities indicating the start and finish dates for project design, engineering, preparation of design development and construction documents, government agency plan check and City document review.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- .4 Activities to be integrated and shown in the CPM network shall include all milestones representing the Design/Build Entity's submittal dates and activities representing the City's review period of each submittal (which review period shall in no case be scheduled for less than 10 working days); Design/Build Entity's procurement of materials and equipment; submittals; manufacture and/or fabrication, testing and delivery to the job-site of special material and major equipment; equipment installation and preliminary, final and performance testing of equipment or systems.
- .5 Activities showing the start and finish dates for all temporary protection.
- .6 Activities showing start and finish dates of owner-furnished items and interface requirement dates with other contractors; regulatory agency approvals; and permits required for the performance of the work.
- .7 Activities showing start and finish of space planning (as appropriate), furniture, fixtures and equipment, moving activities, and occupancy.
- .8 Close-out activities.
- .9 The schedule shall consider all foreseeable factors or risks affecting, or which may affect the performance of the work, including historical and predicted weather conditions, applicable laws, regulations or collective bargaining agreements pertaining to labor, transportation, traffic, air quality, noise and any other applicable regulatory requirements.
- .10 The Design/Build Entity shall not use any "float suppression" techniques such as preferential sequencing or logic, special lead/lag constraints or unjustifiably overestimating activity durations in preparing its schedule.
- .11 The Design/Build Entity's Authorized Schedule Representative shall formally present the detailed time-scaled CPM network for the duration of the contract time, demonstrating compliance with contract milestones and other requirements to the City clearly showing the critical path(s) of the project (activities with 10 days of float or less) through completion.
- .12 Time units for all schedules shall be in calendar days, and no construction activity scheduled to commence within sixty days of the Data Date shall have a duration greater than fifteen calendar days. Activities scheduled to start more than 60 days of the data date shall have durations no greater than thirty days.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- 7.3.4 The proposed Baseline Schedule shall be submitted and reviewed by the City's Construction Manager. Changes to the Baseline Schedule shall be reviewed with the City's Construction Manager prior to implementation. The City, at its sole discretion, may allow or require the Design/Build Entity to more fully detail portions of the Baseline Schedule at a later date.

The City's Construction Manager shall notify the Design/Build Entity of acceptance or of any necessary changes to the CPM network within 10 working days from the formal presentation, after which the Design/Build Entity shall make the required changes and resubmit it for acceptance within five working days certifying in writing that all information contained in it complies with the contract requirements. Upon notification by the City of acceptance of the CPM network, the Design/Build Entity shall prepare computer plots and printouts (8 1/2" x 11"), and complete its submission of the Baseline Schedule, which shall include:

- .1 Bar Charts for Contract Milestones; Summary Level (sorted by craft/trade or project area); and Detail (sorted by Early Dates).
- .2 Reports for: Float (sorted low to high).
- .3 Provide all data files electronically on compact disc.

Once accepted by the City, this schedule shall become the Baseline Schedule for the Project from which all future Progress Schedules will be generated.

- 7.3.5 Design/Build Entity Progress Schedule. Each month, in conjunction with the application for payment process, the Design/Build Entity and City's Construction Manager will conduct monthly reviews to determine: "planned" versus "actual" progress to date; compliance with contract submittal requirements, contract milestones and accepted contract schedule; and determination of any changes to the work plan or implementation which must be made by the Design/Build Entity to comply with the contract schedule. The monthly schedule review shall include, at a minimum:

- .1 Monthly update/status of electronic database shall include recording of all Actual Start Dates and Actual Finish Dates and status of activities in progress.
- .2 Reviews of revisions added or deleted work and how those activities are being integrated into the Design/Build Entity's work plan.
- .3 Review of all impacts to the work during the preceding month and to date, Design/Build Entity evaluation of those impacts and any recovery plans or remedial actions required to comply with the contract schedule.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

Following the review of the above and all other information relevant to the progress of the work, the Design/Build Entity shall adjust its work plan as required to insure compliance with the contract schedule. The requirement for additional work force allocations, additional shifts, overtime, etc., will not entitle Design/Build Entity to additional compensation except to the extent expressly provided for by this Agreement or change order. The contract schedule shall be updated and submitted monthly for the City's Construction Manager's review concurrent with each payment application submitted by the Design/Build Entity. The schedule update shall incorporate actual status to date and shall include the following:

- .1 Computer plotted time-scaled CPM network, in color;
- .2 Bar Charts, generated separately using the format template provide by the City for:
  - (1) Contract Milestones only (Baseline vs. forecast);
  - (2) Summary Level (sorted by craft/trade or project area);
  - (3) Detail (sorted by Early Dates);
- .3 Reports, generated separately using the format template provided by the City for Float (sorted low to high); and
- .4 Provide all data files electronically by Compact Disc.

7.3.5 Design/Build Entity Short-Term Schedule. The Short-Term Schedule shall address activities over an eight-week period. This schedule shall be maintained on a weekly basis and used as a means of compensating for negative effects of as many variables as possible. It shall be directly derived and electronically tied to the Master Schedule to enable rapid impacts of short-term schedule changes on the overall project time line.

The Short-Term Schedule is a dynamic schedule whose activities can vary in both duration and precedence, but only between two sequential milestones as described in the accepted Baseline Schedule. Upon the City's acceptance of the Baseline Schedule, the Design/Build Entity shall begin providing an updated Short-Term Schedule for all participants at each regular progress meeting. The interval format shall be a seven-week projection that shall include one week prior, the week submitted, and six weeks thereafter.

7.3.7 Schedule Revisions. The implementation of revised schedule logic or activity duration estimates for updating the contract schedule or other interim schedule whether furnished by the Design/Build Entity or the City do not constitute an extension of contract time, relaxation of contract milestones or basis for a change to the contract sum. Such revisions are for the purpose of maintaining the accuracy of the contract schedule's representation of the work to be accomplished and to present best duration estimates for work yet to be performed. In updating the contract schedule, the Design/Build Entity shall make

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

no modifications to Activity ID numbers in the accepted contract schedule calculation rules/criteria, or the Activity Coding Structure provided by the City's Construction Manager without the explicit written permission of the City, which permission the City may withhold at its sole discretion.

- 7.3.8 City's Project Master Schedule. The purpose of the Master Schedule is to combine, coordinate, and track schedules produced by the Design/Build Entity and other Project team members throughout the course of the Project. The Master Schedule will also include milestone dates and the Design/Build Entity's Baseline Schedule, and shall be utilized by the City and the Design/Build Entity to identify any coordination issues and/or conflicts with other Project team members under separate contract. The Construction Manager shall be responsible for maintaining, updating and distributing the Master Schedule. The Master Milestone Schedule is shown in Exhibit A.

### 7.4 Float time.

All float time contained in the Work shall be shared between the City and Design/Build Entity. Under no circumstances shall Design/Build Entity be entitled to maintain a claim against the City for Design/Build Entity's failure to achieve Final Completion on a date earlier than that set forth on said Project Milestone Schedule as the same may be adjusted by approved Change Orders.

### 7.5 Compensable Event.

- 7.5.1 Notwithstanding anything in this Design/Build Agreement to the contrary, in the event of a "Compensable Event," as hereinafter defined, Design/Build Entity shall notify the City in writing within 14 days, setting forth all of the facts and circumstances relating to the Compensable Event, the expected financial impact on the Cost Plus with Guaranteed Not To Exceed Amount, and any delays to the Contract Time. In the event the City agrees it is a Compensable Event, the City shall have the option of either:
- (a) adjusting the Contract Time by the delay occasioned by the Compensable Event, if any, and increasing the Cost Plus with Guaranteed Not To Exceed Amount by the financial impact of the Compensable Event, if any, or
  - (b) reducing the scope of the Project so the Cost Plus with Guaranteed Not To Exceed Amount and/or Contract Time will not be exceeded. Design/Build Entity shall cooperate with the City, and provide information at no additional cost to the City, at the City's request to identify appropriate program modifications to achieve the desired effect.

"Compensable Event" shall mean any one of the following:

- .1 material acts or omissions of the City's agents or contractors

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

(other than Design/Build Entity, the Architect of Record and/or any of either or both of their members, subcontractors, employees, consultants or representatives), which are inconsistent with the terms of the Contract Documents and result in any delay or cost increase to the Project that results in an extension of the Contract Time;

- .2 a change in any applicable laws, ordinances, rules, codes, regulation, and lawful orders of governmental authorities relating to the Project after the date of execution of this Agreement by the Design/Build Entity, which results in a delay or cost increase;
- .3 Acts of God events, as defined in Article 1;
- .4 labor disputes, strikes, lockouts, work slow-downs or work stoppages not resulting from Design/Build Entity's failure to comply with any applicable labor agreement or failure to timely order necessary materials or equipment.

### 7.6 Costs of Compensable Event.

The increased costs occasioned by a Compensable Event shall be limited solely to the direct costs of Design/Build Entity and shall not include any consequential damages or lost profits. To the extent a Compensable Event increases the time of performance of either the design or construction, an extension to the Contract Time shall be granted. Notwithstanding the forgoing, if the Compensable Event is of the type described by clauses .3 or .4, immediately above, Design/Build Entity shall not be entitled to recovery of any costs for the first 30 days of delay (in the aggregate), and shall be entitled to file a claim for recovery of costs thereafter, which claim shall be limited to general conditions overhead costs only.

### 7.7 Liquidated Damages.

The City and Design/Build Entity agree the City will suffer economic damage should the Design/Build Entity fail to complete the Project in the time required as shown in Exhibit A. The City has determined the estimated cost of such damages is **\_\_\_\_\_ Thousand Dollars (\$\_\_\_\_\_)** per day, or portion thereof, of a delay in achieving Beneficial Occupancy and a total of **\_\_\_\_\_ Thousand Dollars (\$\_\_\_\_\_)** per day, or portion thereof, of delay in achieving Final Completion for the Project, by the date indicated in the Milestone Schedule shown in Exhibit A. Design/Build Entity agrees that is a reasonable estimate of such costs.

The City and Design/Build Entity agree such amount shall be treated as Liquidated Damages pursuant to Government Code Section 53069.85, Civil Code Section 1671 and Public Contracts Code Section 10226, and Design/Build Entity shall accordingly pay the City the sum of **\_\_\_\_\_ Thousand Dollars (\$\_\_\_\_\_)** per day, or portion thereof, of a delay in achieving Beneficial Occupancy and a total of **\_\_\_\_\_ Thousand Dollars (\$\_\_\_\_\_)** for each day, or portion thereof, by which the Certificate of Final

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

Completion is delayed beyond the Contract Time set forth in the Project Milestone Schedule, whether the City's actual damages for such occupancy delays are more or less than the liquidated sum.

However, if the City has taken Beneficial Occupancy of any portion of the Project, the liquidated damages sum for the Certificate of Final Completion shall be reduced proportionately. For example, if the City takes 10% Beneficial Occupancy of the Project, then the amount of the Liquidated Damages shall be reduced by 10%. This paragraph shall not limit the City's right to seek and obtain additional legal remedies or damages that result from breaches of the Contract Documents by the Design/Build Entity which do not stem from delay in occupancy. Those additional damages include, but are not limited to, such things as breach of contract or breach of warranties either express or implied.

7.7.1 Design-Build Entity acknowledges and agrees the foregoing damages have been set based on an evaluation by City of damages that it will incur in the event of late completion. Design-Build Entity and City agree the amount of such damages is impossible to ascertain as of the date of execution hereof, and the parties have agreed to such Liquidated Damages to fix Design-Build Entity's costs and to avoid later disputes over which items are properly chargeable to Design-Build Entity. It is understood and agreed by Design-Build Entity that any Liquidated Damages payable pursuant to his Agreement are not a penalty and that such amounts are not manifestly unreasonable under the circumstances existing as of the date of execution of this Agreement.

7.7.2 It is further mutually agreed City shall have the right to deduct Liquidated Damages against progress payments or retainage and that the City will issue a unilateral deductive change order and will reduce the Contract Price accordingly. In the event the remaining unpaid Contract Price is insufficient to cover the full amount of Liquidated Damages, Design-Build Entity shall pay the difference to City.

### **ARTICLE 8 – CHANGES IN THE WORK**

8.1 General.

8.1.1 The City may order changes, including but not limited to, revisions to the Construction Documents, performance of extra work, and the elimination of work. Orders for such changes will be in writing. Changes shall not affect the obligations of the sureties on the contract bonds nor require their consent. The Design/Build Entity shall notify the City for their evaluation whenever it appears a change is necessary. Contract Time and Cost Plus with Guaranteed Not To Exceed Amount will be adjusted by written Change Order for changes materially increasing or decreasing the time for performance or cost.

8.1.2 The Design/Build Entity, when ordered by the City, shall proceed with changes before agreement is reached on adjustment in compensation or time for performance, and shall furnish to the City

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

records as specified in this Agreement.

- 8.1.3 If the Design/Build Entity fails to provide such records, then the City's records will be used for the purpose of adjustment in Contract Time and Cost Plus with Guaranteed Not To Exceed Amount.

## 8.2 Change Order.

- 8.2.1 Methods used in determining the value of a Change Order shall be based on one of the following methods:

1. By mutual acceptance of a lump sum increase or decrease in costs. Upon the City's written request, the Design/Build Entity shall furnish a detailed estimate of increase or decrease in costs, together with cost breakdowns of labor, materials and equipment and other support data within the time specified in such request. Cost breakdowns shall include, but are not limited to: hourly labor rates and hours; materials quantities and unit costs; and equipment hourly rates and hours, as an example. The Design/Build Entity shall be responsible for any additional costs caused by the Design/Build Entity's failure to provide the estimate within the time specified.
2. By the City, on the basis of the City's estimate of increase or decrease in the costs.
3. By the City, whether or not negotiations are initiated as provided in this Agreement.
4. By actual and necessary costs, as determined by the City, on the basis of records. Beginning with the first day and at the end of each day, the Design/Build Entity shall furnish to the City detailed hourly records for labor, construction equipment, and services; and itemized records of materials and equipment used that day in performance of the changes. Such records shall be in a format approved by the City. Such records shall be signed by the Design/Build Entity and verified by the City.
5. By Unit Prices stated in the Contract Documents, or subsequently agreed upon.
6. By a manner agreed upon by the City and the Design/Build Entity.

- 8.2.2 Allowable Costs. If an increase or decrease cannot be agreed to as set forth in Clauses 8.2.1.1 through 8.2.1.6, above, then the method for determining the value of the Change Order shall be computed in the following manner:

1. Mark-Ups for Added Work.
  - .a For work performed by the Design/Build Entity in the amount equal to the direct cost (as defined herein) for the work plus the fee percentage of the direct costs for overhead and profit,

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

to be no higher than \_\_ percent..

- .b For work performed by Subcontractor in the amount equal to the direct cost (as defined herein) for the work plus the fee percentage of the direct costs for overhead and profit, to be no higher than \_\_ percent.
- .c For work performed by a Sub-subcontractor (any tier), in the amount equal to the direct cost (as defined herein) for the work plus the fee percentage of the direct costs for overhead and profit, to be no higher than \_\_ percent .
- .d For deleted work the cost savings to the Project shall be shared pursuant to section 6.13

## 8.2.3 Direct Costs:

### .1 Labor

Cost for labor shall include any employer payments to or on behalf of the workmen for health, welfare, pension, vacation and similar purposes. Labor rates will not be recognized when in excess of those prevailing in the locality and time the work is being performed. The costs for all supervision including Project Manager, General Superintendents and Foremen will be included in the markups established by the Contract. The only exception to this will be working foremen who perform actual manual labor. No labor charges will be accepted for engineering or proposal preparation.

These costs will be included in the markups established by the Contract. A breakdown of the payroll rates for each trade will be provided for all Change Orders 15 days after Notice to Proceed including the base rate, benefits, payroll taxes and insurance. Overtime and premium time pricing will only be allowed for labor which, based on mutual agreement, shall be performed after normal working hours. Unless otherwise agreed to by both parties, mechanical and electrical changes will be negotiated using productivity factors no greater than those listed in the following manuals:

- a. Electrical: NECA Column 1 (Normal), Current Edition.
- b. Plumbing and Piping: MCAA Discounted 30%.
- c. HVAC: National Mechanical Estimator by Ottaviano, Current Edition.

### .2 Material

The City shall pay only the actual cost to the Design/Build Entity for the materials directly required for the performance of the changed work. Such cost of materials may include the cost of transportation and no delivery charges will be allowed unless the delivery is specifically for the changed work. If a trade discount by an actual supplier is available to the Design/Build Entity, it shall be credited to

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

the City. If the materials are obtained from a supplier or source owned wholly by or in part by the Design/Build Entity, payment thereof will not exceed the current wholesale price for the materials. The term "trade discount" includes the concept of cash discounting.

If in the opinion of the City, the cost of the materials is excessive or if the Design/Build Entity fails to furnish satisfactory evidence of a cost to him other from the actual supplier, then, in either case, the cost of the materials shall be deemed to be the lowest current wholesale price at which similar materials are available in the quantities required. The City reserves the right to furnish such materials, as it deems advisable and the Design/Build Entity shall have no claims for cost or profits on materials furnished by the City.

### **3. Construction Equipment**

The City shall pay only the actual cost to the Design/Build Entity for the use of equipment directly required in the performance of the changed work. In computing the hourly rental of equipment, any time less than 30 minutes shall be considered one-half hour. No payment will be made for time while equipment is inoperative due to breakdown or for non-workdays. In addition, the rental time shall not include the time required to move the equipment to the work for rental of such equipment and to return it to the source.

No mobilization or demobilization will be allowed for equipment already on site. If such equipment is not moved by its own power, then loading and transportation costs will be paid in lieu of rental time thereof. However, neither moving time nor loading and transportation costs will be paid if the equipment is used on the Project in any other way than upon the changed work. Individual pieces of equipment having a replacement value of \$1,000 or less shall be considered to be small tools or small equipment and no payment will be made therefore.

The rental rate for equipment will not exceed that as recommended by the lower of the rental rates established by distributors or equipment rental agencies or as contained in the Association of Equipment Distributors (AED) book in the locality for performance of the changes. For equipment owned, furnished, or rented by the Design/Build Entity no cost thereof shall be recognized in excess of the rental rates established by distributors or equipment rental agencies and/or the AED or any tier book in the locality for performance of the changes. The amount to be paid to the Design/Build Entity for the use of equipment as set forth above shall constitute full compensation to the Design/Build Entity for the cost of fuel, power, oil, lubricants, supplies, small tools, small equipment, necessary attachments, repairs and maintenance of any kind, depreciation, storage, insurance, labor (except for equipment operators) and any and all costs to the Design/Build Entity incidental to the use of the equipment.

### **8.3 Acceptance of Change Orders.**

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

The Design/Build Entity's written acceptance of a Change Order shall constitute final and binding agreement to the provisions of it and a waiver of all claims in connection with it, whether direct, indirect, or consequential in nature.

### **8.4 Effect on Sureties.**

All alterations, extensions of time, extra and additional work, and other changes authorized by the Contract Documents may be made without securing consent of surety(s).

### **8.5 Covering and Uncovering of Work.**

8.5.1 When inspections are required by the Contract Documents the Design/Build Entity shall notify the City two working days prior to covering any work.

8.5.2 If a portion of the Work is covered prior to the City's review, it shall, if requested in writing by the City, be uncovered for the City's observation and replaced at the Design/Build Entity's expense without change in the Contract Time.

### **8.6 Correction of Work.**

8.6.1 The Design/Build Entity shall promptly correct work rejected by the City or failing to conform to the requirements of the Contract Documents, whether or not fabricated, installed, or completed. The Design/Build Entity shall bear the costs of correcting such rejected work, including additional testing and inspections required and compensation for the City's services and expenses made necessary thereby.

8.6.2 Notwithstanding Paragraph 3.18, Guarantee, in the event of an emergency constituting an immediate hazard to the health or safety of City employees, property, or licensees, the City may undertake, at the Design/Build Entity's expense and without prior notice, all work necessary to correct such hazardous condition(s) when it was caused by work of the Design/Build Entity not being in accordance with requirements of the Contract Documents.

8.6.3 The Design/Build Entity shall remove from the Project site portions of the Work that are not in accordance with the requirements of the Contract Documents, and are neither corrected by the Design/Build Entity nor accepted by the City.

8.6.4 If the Design/Build Entity fails to correct nonconforming work, as per Paragraph 3.18, Guarantee, the City may correct the nonconforming work in accordance with Paragraph 9.3, The City Remedies. If the Design/Build Entity does not proceed with correction of such nonconforming work, within such time fixed by written notice from the City, the City may remove and store the salvable materials articles

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

and/or equipment at the Design/Build Entity's expense.

If the Design/Build Entity does not pay all costs of such removal and storage within 14 days after written notice, the City may, upon 14-additional-days' written notice, sell such materials articles and/or equipment at an auction or private sale, and shall account for the proceeds, after deducting costs and damages that would have been borne by the Design/Build Entity, including compensation for the City's services and expenses made necessary by it. If the proceeds of a sale do not cover all costs that the Design/Build Entity would have borne, the Cost Plus with Guaranteed Not To Exceed Amount shall be reduced by the deficiency. If payments then or thereafter due the Design/Build Entity are not sufficient to cover such amount, the Design/Build Entity shall pay the difference to the City.

8.6.5 The Design/Build Entity shall bear the cost of correcting destroyed or damaged work executed by the City or separate contractors, whether fully completed or partially completed, which is caused by the Design/Build Entity's correction or removal of Work that is not in accordance with requirements of the Contract Documents.

8.6.6 Nothing contained in this Paragraph 8.6, Correction of Work, shall be construed to establish a period of limitation with respect to other obligations that the Design/Build Entity might have in the Contract Documents. Establishment of the time period of one year, as described in Paragraph 3.18, Guarantee, relates only to the specific obligation of the Design/Build Entity to correct the Work, and has no relationship to the time within which the obligation to comply with requirements of the Contract Documents may be sought to be enforced, nor to the time within which proceedings may be commenced to establish the Design/Build Entity's liability with respect to the Design/Build Entity's obligations other than specifically to correct the Work.

8.7 Acceptance of Nonconforming Work.

If the City prefers to accept any or all of the Work that is not in accordance with requirements of the Contract Documents, the City may do so instead of requiring its correction and/or removal, in which case the Cost Plus with Guaranteed Not To Exceed Amount will be reduced as appropriate and equitable. Such adjustment shall be effected whether or not Final Payment to the Design/Build Entity has been made.

### **ARTICLE 9 – EVENTS OF DEFAULT AND TERMINATION**

9.1 City Events of Default.

9.1.1 The following shall be considered the City Events of Default:

.1 If the Work is stopped for a period of 180 consecutive days through no fault of the Design/Build Entity for any of the following reasons:

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- a. The issuance of an order of a court or other public authority having jurisdiction;
- b. An act of government, such as a declaration of national emergency, making material unavailable;
- c. Non-payment by the City for approved design and approved work-inplace after 60 days of a properly submitted and approved invoice.

### 9.2 Design/Build Entity Events of Default.

#### 9.2.1 The following shall be considered Design/Build Entity Events of Default:

- .1 If Design/Build Entity fails or neglects to carry out the Work in accordance with the provisions of the Contract Documents and fails, after seven-days' written notice from the City, to commence a cure to correct such failure or neglect and/or thereafter diligently pursue such cure to completion; or
- .2 If Design/Build Entity materially breaches this Agreement after written notice from the City and fails, after seven-days' notice from the City, to commence a cure to correct such breach and/or diligently pursue such cure to completion; or
- .3 If a custodian, trustee or receiver is appointed for Design/Build Entity, or if Design/Build Entity becomes insolvent or bankrupt, is generally not paying its debts as they become due, or makes an assignment for the benefit of creditors, or if Design/Build Entity causes or suffers an order for relief to be entered with respect to it under applicable Federal bankruptcy law or applies for or consents to the appointment of a custodian, trustee or receiver for Design/Build Entity, or bankruptcy, reorganization, arrangement or insolvency proceedings, or other proceedings for relief under any bankruptcy or similar law or laws for the relief of debtors, are instituted by or against the Design/Build Entity, and in any of the foregoing cases such action is not discharged or terminated within 60 days of its institution; or
- .4 If the Design/Build Entity changes its corporate identity in a manner different from that described in this Agreement due to merger, takeover, offer, sale or exchange of interest therein, dissolution, whether by operation of law or otherwise, and the change in interest is not approved in advance in writing by the City. In the event such a change does not have the effect of diminishing or impairing the Design/Build Entity's ability to perform the Work or its financial capabilities, such approval shall not be unreasonably withheld. The City shall have at least 30-days' notice of such a change.

### 9.3 City Remedies.

- 9.3.1 Without prejudice to any other rights or remedies of the City, the following remedies shall be available to the City in the case of a Design/Build Entity event of default:

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- .1 The City shall have the right to terminate this Agreement upon an additional seven-days' written notice to Design/Build Entity; provided that Design/Build Entity has not commenced a cure within such seven- day period.
- .2 The City may take possession of the Project site and of all materials, equipment, tools and construction equipment on site owned by Design/Build Entity.
- .3 The City may accept assignment of the construction subcontract and/or design subcontract.
- .4 The City may finish the Work by whatever reasonable method the City may deem expedient.
- .5 The City may seek such remedies as may be available under existing law.

### 9.4 Termination.

When the City terminates this Design/Build Agreement as provided above, Design/Build Entity shall not be entitled to receive further payment until the Work is finished. If the unpaid balance of the Cost Plus with Guaranteed Not To Exceed Amount exceeds costs incurred by the City in finishing the Work, then such excess shall be paid to Design/Build Entity. However, if such costs exceed the unpaid balance of the Cost Plus with Guaranteed Not To Exceed Amount, then Design/Build Entity shall pay the difference to the City.

### 9.5 Design/Build Entity Remedies.

The following remedy shall be available to Design/Build Entity in the case of the City event of default: Design/Build Entity may, upon seven-days' additional written notice to the City, terminate this Agreement and recover from the City payment for Work performed and for proven loss with respect to materials, equipment tools, construction equipment and services rendered, including reasonable overhead and profit.

### 9.6 Multiple Remedies.

Except as otherwise provided in this Design/Build Agreement, no remedy under the terms of this Design/Build Agreement is intended to be exclusive of any other remedy, but each and every such remedy shall be cumulative and shall be in addition to any other remedies, existing now or hereafter, at law, in equity or by statute. No delay or omission to exercise any right or power accruing shall impair any such right or power nor shall it be construed to be a waiver of any event of default or acquiescence to it, and every such right and power may be exercised from time to time as often may be deemed expedient.

### 9.7 Termination for Convenience.

The City may terminate this Design/Build Agreement at any time for

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

convenience if the City determines such termination is in the best interests of the City upon 60-days' advance written notice. In the event the City terminates this Agreement for convenience and subsequently rebids or otherwise completes the Project, then Design/Build Entity shall be entitled to recover lost profits in addition to other costs recoverable under this Agreement, so long as it shall provide a title insurance policy in an amount acceptable to the City together with such endorsements as may be requested by the City.

Such Title Insurance policies and endorsements shall be at the sole cost and expense of the Design/Build Entity and shall insure the Project is free of all liens and encumbrances. Any liens or charges encumbering the Project, or which are claimed to encumber the Project, other than those placed by or agreed upon by the City, shall be offset against whatever amount is determined to be owed to the Design/Build Entity.

### 9.8 Termination Payment.

In the event the City terminates this Design/Build Agreement for convenience as set forth above, the City shall pay to the Design/Build Entity all funds due the Design/Build Entity for work satisfactorily performed up to the date of termination, plus all demobilization and close-out costs, including, but not limited to, any penalties payable to subcontractors for early termination, plus reasonable overhead and profit. All funds due pursuant to this Section, including unpaid retainage, shall be released within 30 days after termination of the Design/Build Agreement for convenience, subject to the provisions of Paragraph 9.7, Termination for Convenience.

### 9.9 Property Rights.

In the event of termination, all studies, reports, special forms, schedules, designs and any other written information pertaining to the Project shall become the City's property as provided in this Agreement.

### 9.10 Suspension of Work.

9.10.1 City may order Design/Build Entity, in writing, to suspend, delay, or interrupt all or any part of the Work for the period of time that the City determines appropriate for the convenience of the City.

9.10.2 If the performance of all or any part of the Work is for any period of time, suspended, delayed, or interrupted (a) by an act of the City in the administration of the Design/Build Agreement, or (b) by the City's failure to act within the time specified in the Design/Build Agreement (or within a reasonable time if not specified), or (c) for other reasons which Design/Build Entity is entitled to claim delay under the Agreement, Design/Build Entity shall provide notice according to the Agreement.

9.10.3 Design/Build Entity shall be entitled to an increase in the Cost Plus with Guaranteed Not To Exceed Amount and the Contract Time to the extent the cost of performance of the Design/Build Agreement or

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

the time therefore is increased as a result of suspension, delay, or interruption by the City or as otherwise provided in the Contract Documents. However, no adjustments shall be made under this Article for any suspension, delay, or interruption to the extent that Design/Build Entity's performance would have been so suspended, delayed, or interrupted by any other cause for which Design/Build Entity would not be entitled to an increase in the Cost Plus with Guaranteed Not To Exceed Amount or in the Contract Time.

### **9.11 Non-Compliance with Design/Build Agreement Requirements**

In the event the Design/Build Entity, after receiving written notice from the City of non-compliance with any requirement of the Design/Build Agreement, fails to initiate promptly such action as may be appropriate to comply with the specified requirement within a reasonable period of time, the City shall have the right to order Design/Build Entity to stop all Work in the area affected until Design/Build Entity has complied with or has initiated such action as may be appropriate to comply within a reasonable period of time. Design/Build Entity will not be entitled to any extension of Contract Time or Stipulated Sum for any costs incurred as a result of being ordered to stop Work for such cause.

## **ARTICLE 10 – DISPUTES AND CLAIMS**

### **10.1 Dispute and Claim Procedures.**

10.1.1 When the Design/Build Entity and the City fail to agree whether or not any work is within the scope of Contract Documents, the Design/Build Entity shall immediately perform such work upon receipt of a written notice to do so by the City. Within 14 days after receipt of such notice, the Design/Build Entity may submit a written protest to the City, specifying in detail in what particular Contract Documents were exceeded, and approximate change in cost resulting so that the City will have notice of a potential claim.

Failure to submit a protest within the specified period shall constitute a waiver of any and all rights to an adjustment in Cost Plus with Guaranteed Not To Exceed Amount and Contract Time due to such work, and the Design/Build Entity thereafter shall not be entitled to adjustment of the Cost Plus with Guaranteed Not To Exceed Amount or Contract Time. For any such work that is found to exceed Contract Documents, there shall be an adjustment in Cost Plus with Guaranteed Not To Exceed Amount and Contract Time on same basis as any other change in the Work.

- .1 The Design/Build Entity shall provide supporting data and shall provide and maintain records of costs attributable to disputes in similar manner as for Change Orders in Article 8, Changes in the Work.
- .2 The City and the Design/Build Entity will make every reasonable effort to resolve the dispute prior to proceeding to the next step.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- .3 Either the City or the Design/Build Entity may call a special meeting for the purpose of resolving the dispute. Such a meeting will be held within seven days after written request of it.
- .4 If the dispute as to the Contract Documents has not been resolved, the Design/Build Entity shall, within 14 days after the special meeting, take one or more of the following actions:
- .a submit additional supporting data requested by the City;
  - .b modify the initial dispute;
  - .c notify the City that the initial dispute stands as is; or
  - .d withdraw the dispute. Once withdrawn, the dispute cannot be reopened by the Design/Build Entity.
- .5 If the dispute has not been resolved within seven days after the Design/Build Entity's action in response to Clause 10.1.1.4, another meeting may be scheduled, at the City's option, with senior management personnel of the City and the Design/Build Entity. The purpose of this meeting is to resolve the dispute prior to proceeding to the action under Subparagraph 10.1.2, Dispute and Claim Procedures.
- .6 Any dispute not resolved by the above meetings shall be settled by mediation conducted by a third-party neutral from Judicial Arbitration and Mediation Services ("JAMS") jointly appointed by the parties. Said mediation shall occur in San Luis Obispo County, with the costs split between all parties participating in the mediation.
- 10.1.2 If a dispute has not been resolved at the time of the City's proposed Final Payment, then the Design/Build Entity shall submit within 30 days a claim along with detailed documentation required by Subparagraph 10.1.1, Dispute and Claim Procedures, for the City's consideration. The City will render a written decision to the Design/Build Entity relative to the claim. The City's written decision shall be final and binding on the party(ies). The City may withhold from the Final Payment an amount not to exceed 150% of the disputed amount. If there appears to be a possibility of a Design/Build Entity's default, then the City may, but is not obligated to, notify the surety and request the surety's assistance in resolving the controversy.

Any claim not resolved by the foregoing section will be subject to resolution pursuant to procedures set forth in Public Contract Code Section 20104, regardless of whether such claims exceed \$375,000. Said procedures are incorporated as though fully set forth in this Agreement.

- 10.1.3 Maintenance of Existence. Design/Build Entity covenants that it

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

will remain in existence during the term of the Design/Build Agreement and for a period of time five years after Final Completion of the Project (the "Corporate Maintenance Period"). The purpose for which Design/Build Entity shall remain in existence during the Corporate Maintenance Period is to assure the City that Design/Build Entity will be able, during the Corporate Maintenance Period, to address and/or pay claims by the City against the Design/Build Entity if the City deems the Design/Build Entity to be insufficiently capitalized to be able, on its own to carry out its obligations hereunder (financial or otherwise). In the event a guarantee of the Design/Build Entity is required by the City, from the date of this Design/Build Agreement and during the remainder of the Corporate Maintenance Period, then the guarantee shall be in the form of Exhibit C, Design/Build Entity's Guarantee, attached hereto.

### 10.2 Public Contracts Code section 9204

10.2.1 Notwithstanding the foregoing, attention is directed to the summary of Section 9204 of the Public Contract Code (PCC) regarding the claims resolution process for all public works projects. Any dispute or claim against the City under a public works project shall be processed in accordance with PCC section 9204 and any other applicable law. Any of the foregoing that is inconsistent with PCC section 9204 or applicable law shall not apply..

### **SUMMARY OF PCC SECTION 9204**

Any dispute or claim regarding the project shall be resolved in accordance with PCC section 9204, which is summarized herein, and other applicable law. "Claim" means a separate demand by a contractor sent by registered mail or certified mail with return receipt requested, for one or more of the following: (i) a time extension, including, without limitation, for relief from damages or penalties for delay assessed by the City under a contract for a public works project; (ii) payment by the City of money or damages arising from work done by, or on behalf of, the Design/Build Entity pursuant to the contract for a public works project and payment for which is not otherwise expressly provided or to which the claimant is not otherwise entitled; or (iii) payment of an amount that is disputed by the City.

Upon receipt of a claim, the City shall conduct a reasonable review of the claim and, within a period not to exceed 45 days, shall provide the claimant a written statement identifying what portion of the claim is disputed and what portion is undisputed. Upon receipt of a claim, the City and the Design/Build Entity may,

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

by mutual agreement, extend the time period provided in Section 9204. The claimant shall furnish reasonable documentation to support the claim. If the City needs approval from the City Council to provide the claimant a written statement identifying the disputed portion and the undisputed portion of the claim, and the City Council does not meet within the 45 days or within the mutually agreed to extension of time following receipt of a claim sent by registered mail or certified mail, return receipt requested, then the City shall have up to three days following the next duly publicly noticed meeting of the City Council after the 45-day period, or extension, expires to provide the claimant a written statement identifying the disputed portion and the undisputed portion. Any payment due on an undisputed portion of the claim shall be processed and made within 60 days after the City issues its written statement.

If the claimant disputes the City's written response, or if the City fails to respond to a claim issued pursuant to PCC section 9204 within the time prescribed, then the claimant may demand in writing an informal conference to meet and confer for settlement of the issues in dispute. Upon receipt of a demand in writing sent by registered mail or certified mail, return receipt requested, the City shall schedule a meet and confer conference within 30 days for settlement of the dispute.

Within 10 business days following the conclusion of the meet and confer conference, if the claim or any portion of the claim remains in dispute, then the City shall provide the claimant a written statement identifying the portion of the claim that remains in dispute and the portion that is undisputed. Any payment due on an undisputed portion of the claim shall be processed and made within 60 days after the City issues its written statement.

Any disputed portion of the claim, as identified by the Design/Build Entity in writing, shall be submitted to nonbinding mediation, with the City and the claimant sharing the associated costs equally. The City and claimant shall mutually agree to a mediator within 10 business days after the disputed portion

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

of the claim has been identified in writing. If the parties cannot agree upon a mediator, then each party shall select a mediator and those mediators shall select a qualified neutral third party to mediate with regard to the disputed portion of the claim. Each party shall bear the fees and costs charged by its respective mediator in connection with the selection of the neutral mediator. If mediation is unsuccessful, then the parts of the claim remaining in dispute shall be subject to applicable law. Mediation includes any nonbinding process, including, but not limited to, neutral evaluation or a dispute review board, in which an independent third party or board assists the parties in dispute resolution through negotiation or by issuance of an evaluation. Any mediation utilized shall conform to the timeframes in Section 9204 of the Public Contract Code. Unless otherwise agreed to by the City and the Design/Build Entity in writing, the mediation conducted pursuant to PCC section 9204 shall excuse any further obligation under PCC section 20104.4 to mediate after litigation has been commenced.

PCC section 9204 does not preclude the City from requiring arbitration of disputes under private arbitration or the Public Works Contract Arbitration Program, if mediation under PCC section 9204 does not resolve the parties' dispute.

Failure by the City to respond to a claim from the Design/Build Entity within the time periods described herein or to otherwise meet the time requirements of PCC section 9204 shall result in the claim being deemed rejected in its entirety. A claim that is denied by reason of the City's failure to have responded to a claim, or its failure to otherwise meet the time requirements of PCC section 9204, shall not constitute an adverse finding with regard to the merits of the claim or the responsibility or qualifications of the claimant.

Amounts not paid in a timely manner as required by PCC section 9204 shall bear interest at seven percent per annum.

If a subcontractor or a lower tier subcontractor lacks legal standing to assert a claim against the City because privity of contract does not exist, then the

## **DRAFT DOCUMENT - NOT A PUBLIC RECORD**

Design/Build Entity may present to the City a claim on behalf of a subcontractor or lower tier subcontractor. A subcontractor may request in writing, either on his or her own behalf or on behalf of a lower tier subcontractor, the Design/Build Entity present a claim for work which was performed by the subcontractor or by a lower tier subcontractor on behalf of the subcontractor. The subcontractor requesting the claim be presented to the City shall furnish reasonable documentation to support the claim. Within 45 days of receipt of that written request, the Design/Build Entity shall notify the subcontractor in writing as to whether the Design/Build Entity presented the claim to the City and, if the original contractor did not present the claim, provide the subcontractor with a statement of the reasons for not having done so.

A waiver of the rights granted by PCC section 9204 is void and contrary to public policy; provided, however, that (1) upon receipt of a claim, the parties may mutually agree to waive, in writing, mediation and proceed directly to the commencement of a civil action or binding arbitration, as applicable; and (2) the City may prescribe reasonable change order, claim, and dispute resolution procedures and requirements in addition to the provisions of PCC section 9204, so long as the contractual provisions do not conflict with or otherwise impair the timeframes and procedures set forth in PCC section 9204.

### **ARTICLE 11 – PROTECTION OF PERSONS AND PROPERTY**

#### 11.1 Safety of Persons and Property.

11.1.1 The Design/Build Entity shall be solely responsible for initiating, maintaining, and supervising all safety precautions and programs in connection with the performance of the Work. The City shall have no responsibility for initiating, maintaining and supervising safety of persons and property.

11.1.2 The Design/Build Entity shall take precautions for safety and provide protection to prevent damage, injury or loss to:

- .1 Employees working under the Agreement and other persons who may be affected by it;
- .2 The Work and materials and equipment to be incorporated in it, whether in storage on or off the Project site, under care, custody or control of the Design/Build Entity or the

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

Design/Build Entity's subcontractors or sub-subcontractors;  
and

- .3 Other property at the Project site, or adjacent to it, such as trees, shrubs, lawns, walks, pavements, roadways, structures and utilities not designated for removal, relocation or replacement during the course of construction.

11.1.3 The Design/Build Entity shall comply with all applicable laws, ordinances, rules, regulations and lawful orders of public authorities bearing on the safety of persons or property, or their protection from damage, injury or loss.

11.1.4 The Design/Build Entity shall erect and maintain, as required by existing conditions and performance of the Contract Documents, safeguards for safety and protection, including posting danger signs and other warnings against hazards, promulgating safety regulations and notifying the City, other owners (other than the City) and users of adjacent sites and utilities.

11.1.5 The Design/Build Entity shall comply with all applicable laws, ordinances, rules, regulations and lawful orders of public authorities regarding the storage and/or use of explosives or other hazardous materials or equipment necessary for execution of Work. The Design/Build Entity shall employ properly qualified personnel for supervision of same.

11.1.6 The Design/Build Entity shall remedy damage and loss to property referred to in Clauses 11.1.2.2 and 11.1.2.3 caused in whole or in part by the Design/Build Entity, a subcontractor, a sub-subcontractor, or anyone directly or indirectly employed by any of them, or by anyone for whose acts they may be liable and for which the Design/Build Entity is responsible under Clauses 11.1.2.2 and 11.1.2.3. The foregoing obligations of the Design/Build Entity are in addition to the Design/Build Entity's obligations under Paragraph 12.3, Indemnification.

11.1.7 The Design/Build Entity shall not permit any part of the Work or Project site to be loaded so as to endanger its safety.

11.1.8 When conditions of the Work, in the judgment of the City, present unreasonable risk of injury or death to persons or property damage, the City, may direct the Design/Build Entity, at the Design/Build Entity's sole expense, to close down the Work and not commence work again until all dangerous conditions are eliminated.

11.1.9 The Design/Build Entity, at the Design/Build Entity's own cost, shall rebuild, repair, restore and make good any and all damages to any portion of the Work affected by such causes before its acceptance.

## 11.2 Emergencies.

In an emergency affecting safety of persons or property, the Design/Build

# DRAFT DOCUMENT - NOT A PUBLIC RECORD

Entity shall act, at the Design/Build Entity's sole discretion, to prevent any threatened damage, injury or loss. Additional compensation or extension of Contract Time claimed by the Design/Build Entity because of an emergency will be reviewed as provided in Article 8, Changes in the Work.

## ARTICLE 12 – INSURANCE, BONDS, AND INDEMNIFICATION

### 12.1 Insurance.

12.1.1 Design/Build Entity shall not commence work under this Contract until all insurance has been obtained that is required under this section and such insurance has been verified by the City, nor shall Design/Build Entity allow any Subcontractor to commence work on its Contract until all similar insurance required of the Subcontractor has been so obtained and approved. Design/Build Entity shall furnish the City with three copies of each required certificate of insurance, as provided below. Design/Build Entity shall have the following insurance coverage:

a. Workers' Compensation Insurance and Employer's Liability Insurance.

Design/Build Entity shall maintain during the life of the Contract Workers' Compensation Insurance and Employer's Liability Insurance for all of its employees employed on the project as described herein. Said insurance shall comply with the following:

- i. Workers' Compensation Insurance in compliance with the laws of the State of California and any applicable federal statutes.
- ii. Employers liability insurance of not less than One Million Dollars (\$1,000,000) each accident and One Million Dollars (\$1,000,000) each employee.

In signing the Contract, Design/Build Entity shall make the following certification, required by Section 1861 of the Labor Law: "I am aware of the provisions of Section 3700 of the Labor Code which require every employer to be insured against liability for workers' compensation or to undertake self-insurance in accordance with the provisions of that code, and I will comply with such provisions before commencing the performance of the work of this contract."

b. Automobile and General Liability. Design/Build Entity shall have throughout the term of this contract policies of liability insurance covering automobile and general liability as follows:

- i. Owned/non-owned and hired automobile liability insurance with primary limits for bodily injury and property damage liability of not less than One Million Dollars (\$1,000,000) per accident. Umbrella and/or excess liability limits of not less than Two Million Dollars (\$2,000,000) per accident.

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- ii. Commercial general liability and/or umbrella excess liability insurance providing coverage on an occurrence basis and with limits of not less than Five Million Dollars (\$5,000,000) each occurrence and annual aggregate for bodily injury and property damage liability combined including:
  - 1) Premises and operations liability coverage;
  - 2) Owner's and contractor's protective liability coverage;
  - 3) Broad form property damage liability coverage including completed operations;
  - 4) Blanket contractual liability coverage;
  - 5) Deletion of any limitations relating to liability arising out of explosion, collapse or underground hazards;
  - 6) Personal and advertising injury liability coverage;
  - 7) For excavation and foundations, deletion of any limitation on coverage for bodily injury or property damage arising out of subsidence of soil or earth movement; and
  - 8) For demolition and/or hazardous materials removal, deletion of any limitation regarding asbestos and/or lead risk exposure.
  - 9) An endorsement specifying that policy aggregate limits apply separately to the project covered by this contract;
  - 10) Errors & Omissions
  - 11) Products and Completed Operations including five year extension endorsement
  - 12) Occurrence Definition to include "Assault and battery committed by, at the direction of or on behalf of any insured for the purpose of protecting the person or property of any insured or of others shall be deemed to be an occurrence."
  - 13) Extended Personal Injury definition to include alienation of affections, discrimination, or humiliation.
  - 14) Bodily Injury Definition to include mental anguish, shock, mental injury, humiliation, sickness, or disease sustained by a person, including death

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

resulting from any of these at any time.

- 15) Exclusion Property Damage to the Insured's Work to read: "Property damage" to that particular part of "your work" that is defective or actively malfunctions. This exclusion applies only to the "products-completed operation" hazard. It does not apply if the damaged work or the work out of which the damage arises was performed on Design/Build Entity's behalf by a subcontractor.
- 16) Contractual Liability – Municipal Work: The phrase "any other contract or agreement pertaining to your business," as included in the definition of an insured contract, includes an indemnification of a municipality required by ordinance and in connection with work performed for the municipality.
- 17) Professional Liability Insurance. Upon execution of this contract, Design/Build Entity shall obtain professional liability insurance with limits of at least Five Million Dollars (\$5,000,000) per claim and aggregate which shall cover claims resulting from professional errors and omissions of Design/Build Entity and any of its consultants in connection with the work provided such claims arise during the period commencing upon the preparation of the construction documents and ending five years following Final completion. Such insurance shall be in form reasonably acceptable to the City's Risk Manager.
- 18) Builders' Risk Insurance/Installation Floater. Design/Build Entity shall have until contract completion "all risk" builders' risk property insurance, jointly in the names of the City and the Design/Build Entity, payable as their respective interest may appear, such insurance all times to be of sufficient amount to cover fully all loss or damage to the work under this Contract, at 100% replacement cost. Design/Build Entity's responsibility for earthquake coverage shall be in accordance with Public Contract Code Section 7105. Such insurance shall be in a form acceptable to the City's Risk Manager and shall include coverage for machinery during testing.
- 19) Subcontractor Insurance. Design/Build Entity shall cause all subcontractors engaged to perform work required of Design/Build Entity pursuant to this Contract to have Workers' Compensation, Commercial General Liability/Umbrella and/or Excess Liability, and Automobile Insurance in a form and amount deemed appropriate by the Design/Build Entity for work performed under this Contract.

- 20) **DESIGN/BUILD ENTITY POLLUTION LEGAL LIABILITY** (CPL) (and/or other applicable policies as determined by the City's Risk Manager or his/her designee, e.g. Asbestos Legal Liability) *unless waived in writing by the CITY'S Risk Manager or his/her designee* shall be written on either an occurrence form, or a claims-made form, and is required for all environmental and water remediation work and for all work transporting fuel. CPL is also required for demolition, renovation, HVAC, plumbing and electrical work (including, without limitation, lighting) on any structure built prior to the year 1990 with limits of liability of not less than the following:
- (i) \$1,000,000 per occurrence or claim; and,
  - (ii) \$2,000,000 general aggregate per annual policy period.

In the event this Agreement involves any lead based, mold or asbestos environmental hazard, either the CAL policy or other appropriate insurance policy shall be endorsed to include *Transportation Pollution Liability insurance* covering materials to be transported by the Design/Build Entity pursuant to the Agreement.

### 12.2 Indemnification.

12.2.1 The Design/Build Entity will indemnify, defend and hold harmless the City and its respective officers, elective and appointive Board, employees and consultants (including the Project Manager and Architect of Record) against all loss, expense (including, but not limited to, attorneys' fees and court costs), damage, injury, liability, causes of action or claims of any kind or character (collectively "claims" and individually a "claim"), provided that such claim or claims is/are attributable to bodily injury, sickness, disease or death, or to injury to or destruction of tangible property (other than the Work itself for claims not covered by insurance which is required under this Agreement) including loss of use resulting there from (except loss of use attributable to a claim otherwise insured as provided under this Agreement), in any way arising out of this Agreement or the Work, including but not limited to the acts or omissions of the Design/Build Entity, its partners, officers, directors, employees, agents, licensees, invitees, consultants, vendors, or subcontractors of any tier (collectively the "Design/Build Entity"). Such indemnification shall include, but not be limited to any claim arising from or caused by:

- (i) any defect in the construction documents, or the design or construction of or materials used in the Work or in any machine, equipment, appliance, or other item of personal property installed or located therein;

## DRAFT DOCUMENT - NOT A PUBLIC RECORD

- (ii) any defect in the preparation of soils or in the design and accomplishment of grading;
- (iii) any violation or alleged violation by any member of the Design/Build Entity of any law existing as of the date of this Agreement or hereafter enacted (provided that with respect to laws enacted after the date of the Design/Build Agreement, the Design/Build Entity may be entitled to an adjustment in the Contract Sum and/or Contract Time as provided in the Design/Build Agreement);
- (iv) any negligent acts or omissions or other tortious conduct of the Design/Build Entity or any member of the Design/Build Entity;
- (v) any accident on the job site or other casualty thereon;
- (vi) any other cause whatsoever in connection with the Design/Build Entity's use of or activities on the job site or the Design/Build Entity's performance under this Agreement; and/or
- (vii) the inaccuracy or incorrectness of any representation or warranty of the Design/Build Entity to the City under this Agreement. Notwithstanding the foregoing, the obligations of the Design/Build Entity in this paragraph are intended to apply only to third party claims arising out of the Agreement or the Work, and not to property damage to the City, which damage is treated elsewhere in this Agreement.

- .1 Subject to Paragraph 3.20, the Design/Build Entity will indemnify, defend and hold harmless the City and its respective officers, elective and appointive Board, employees and consultants (including the Project Manager and Architect of Record) from all claims by reason of, or in the course of the performance of, said Work, by reason of any infringement or alleged infringement of the patent rights, copyrights, and/or trademarks of any person or persons, firm, or corporation in consequence of the use in, on or about said Work, of any article or material supplied or installed under this Agreement (except to the extent such article or material was directed to be supplied or installed by the City).

Neither the City and its respective officers, elective and appointive Board, employees and consultants (including the Project Manager and Architect of Record) shall be liable for any loss or damage that may happen to the Work, or any part of it; nor to any of the materials or other items used or employed in performing the Work; nor for injury to any person or persons, either workers or the public, for damage to property from any cause which might have been prevented by the Design/Build Entity, or the Design/Build Entity's employees or agents, against all of which injuries or damages the
